PROGRESS REPORT

Angola: progress report, September 2025 – September 2026

Edition of 2026-09-10-2 · compiled by Claude Opus from the documents in the Corpus repository

GOVERNANCE · FINANCE · ICT INFRASTRUCTURE · DPI · DIGITALISATION · TECHNOLOGY · CAPACITY · INCLUSION · DATA · GEOPOLITICS · WHERE THE RECORD IS THIN

This report asks the same set of questions of every country. The rows below are a fixed frame of indicators, one row each, chosen in advance and covering all thirty-eight subjects the base tracks — so what appears here is decided by the frame and not by whichever records happened to accumulate. Each row says what happened on that indicator during the period, with every claim linked to the source it rests on.

Where a row reads *No evidence*, the base holds nothing on that indicator. **That is a statement about this base, not about the country** — it does not mean nothing exists, only that nothing has been collected here yet. The rows that carry evidence say what it is; the rows that do not are left to speak for themselves.

The period is 2025-09-01 to 2026-09-10.

Progress values. *Movement* — a system entered service, a stage was completed or an instrument was made. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the base holds a standing position and nothing in the period touched it. *No evidence* — the base holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Movement, regulations still pending*.

Governance

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	**Digital transformation strategy**	The digital transition agenda now counts 218 structuring projects across six objectives, up from 214, coordinated by a modernisation institute under the presidency. 2026-03-05 — the agenda was restated at 218 structuring projects across six objectives and seven axes, coordinated by a modernisation institute under the presidency, against 214 when it was presented abroad in March 2025. The project count is the only published progress metric. Nothing states how many of the projects are complete, what any of them cost or which public services they produce, so the agenda's movement over the window is an increase of four in its own inventory.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	**ICT strategy**	The white paper for 2023-2027, approved as an annex to a presidential decree, is the operative national strategy for the sector. The strategy is settled and its text is on the base: the white paper for information and communication technology 2023-2027, approved as an annex to a presidential decree of December 2024 and replacing the 2019-2022 edition. It is what the sector's connectivity, cybersecurity and inclusion commitments hang from. Two subordinate strategies sit under it and both moved earlier than this window: a national cybersecurity strategy adopted by decree in December 2025, and a national artificial intelligence strategy still in preparation. Nothing in the twelve months to September 2026 amends, extends or supersedes the white paper itself.	NO CHANGE
Strategies, plans and policies	**Broadband strategy**	No standalone broadband strategy. Broadband sits inside the sector white paper, with the national broadband network as the delivery vehicle. There is no separate broadband policy, plan or target document. What governs broadband is the sector white paper for 2023-2027, and what delivers it is a financed construction project: the national broadband infrastructure upgrading programme, whose appropriation the 2026 budget cut. The measured position is published by the regulator rather than by a strategy: 55.5 per cent of individuals using the internet in 2024, 12,785,472 broadband subscriptions at 36.4 per cent penetration, and population coverage of 77.41 per cent at fourth generation and 16.4 per cent at fifth. Nothing states a target those figures are measured against.	NO CHANGE
Strategies, plans and policies	**Data storage / cloud strategy**	A national policy for managing and hosting public data went out to consultancy in March 2026, over an estate that already has a national cloud. The policy is being written after the infrastructure was built, not before. The administrative modernisation institute put a national policy for the management and hosting of public data, with its regulation, out to consultancy in March 2026 under the digital acceleration project. That is the first instrument on the base addressed to where public data should live. The estate it will govern already exists: a national cloud across two government data centres, the government data centre inaugurated in April 2026, and a backup and cloud centre of 48 racks. The state information systems institute holds the mandate over all of it.	MOVEMENT
Strategies, plans and policies	**Data interoperability framework / roadmap**	The interoperability platform contract reached US$13 million and a presidential commission was created in June 2026 to update the citizen database behind it. The framework has a decree, a platform and now a governing body. The 2018 decree on public administration interoperability is the standing instrument; implementation and training terms of reference went out in February 2026, and the platform contract is reported at US$13 million. In June 2026 the president created a commission to update the database of adult citizens, with a supplementary credit of US$275 million behind it. The one exchange already running in production is narrow: the tax authority's compliance certificate served to other state bodies. Nothing publishes a roadmap with dates.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	**AI strategy**	A readiness assessment names the absence of an artificial-intelligence strategy as the central gap, with no adoption date, drafting body or timetable on record. 2026-06-30 — preliminary findings of a UNESCO readiness assessment were presented to the ministry, identifying the absence of a dedicated artificial-intelligence instrument as the central gap and offering the assessment as the base for future policy. The same assessment scores 50.9% of its indicators fully ready, 32.7% partially ready and 16% insufficient, with data governance at 47 out of 100 and science-workforce availability at about 12%. The higher figure quoted elsewhere is the first two bands added together and is not a readiness score. No adoption date, drafting body or timetable for a strategy is on record. What the country has instead is a draft artificial-intelligence law, reported under legislation, which is an instrument without a policy behind it.	NO CHANGE the absence now documented rather than closed
Strategies, plans and policies	**Data localisation policies**	No general localisation rule. Transfers out are authorised case by case, and the only sectoral hosting rule is the central bank's. Angola has no statute or decree requiring public or personal data to be held in the country. What it has instead is a permissioning regime: the data-protection agency publishes no list of countries it regards as adequate, assesses adequacy case by case under article 33 of the 2011 law, and requires a fresh notification whenever the authorised conditions change. Every transfer out is therefore an individual authorisation. One sector goes further. The central bank's 2020 notice on cyber security and cloud computing sets the conditions on which financial institutions may place data with a cloud provider. The national policy for managing and hosting public data is the instrument that might one day generalise it.	NO CHANGE
Strategies, plans and policies	**Data governance policy**	Regulators worked national data holdings against the continental data policy framework in Maputo, while the 2011 data-protection law awaits its revision. Data governance here is a law plus a regulator plus, since December, a method. The 2011 personal data protection law remains the governing statute and a replacement is announced for the next legislative year. The agency created to enforce it issued substantial fines in June 2026. The method arrived in December 2025, when more than 40 regulators from four Lusophone states met in Maputo to map national data holdings and governance gaps against the continental data policy framework and the Smart Africa blueprint, and launched the Portuguese edition of a data-governance toolkit. No national data governance policy document has been adopted.	MOVEMENT
Strategies, plans and policies	**Open data policy**	The statistics institute undertook to publish 10 per cent of census microdata six months after the definitive results. The open-data portal remains a project commitment. The most concrete open-data undertaking on this base came with the census. Publishing the definitive results in November 2025, the statistics institute invoked the accessibility principle of the national statistical system law and stated that the results and 10 per cent of the microdata would be on its own site six months later. That date fell in May 2026, and nothing on the base records the microdata appearing. A census portal and mobile application did launch in July 2026. The framework above it is still a plan. An open-data portal and shared data-governance framework are commitments of the digital acceleration project, with nothing published as operating. The 2002 access to administrative documents law is not an open-data instrument.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Legislation and regulation	**Data protection legislation**	The 2011 law stands unamended; a revision closed consultation while an amendment opening electoral data was rejected. The standing instrument has been in force since 17 June 2011, with consent and notification duties, sensitive-data limits and transfer approvals. Three of its provisions matter more than its fines: article 35(6) substitutes a statute or decree for the regulator's authorisation, article 24 does the same for database interconnection, and article 4(2)(a) puts processing under state-secrecy, state-security and judicial-secrecy rules outside the law altogether. 2026-06-17 — public consultation closed on a revision adding a data-protection officer duty for high-volume processors, stronger oversight and sanction mechanisms, and fines redenominated into local currency, due at the Council of Ministers and then the National Assembly. No draft text is held. 2026-06-25 — parliament rejected in plenary an amendment that would have opened the citizen databases and the electoral registers to parties and citizens, after it had cleared committee in April. The registers stay closed.	MIXED a revision consultation closed while an amendment opening electoral data was rejected
Legislation and regulation	**Cybersecurity legislation**	The National Assembly adopted the cybersecurity bill on 12 August 2026 by 104 votes to 56, with promulgation and entry into force not on file. 2026-08-12 — the National Assembly adopted the bill in plenary by 104 votes to 56 on a presidential initiative, the governing party for and the main opposition against with no abstentions, after committee approval on 4 August and passage in generality in January 2026. The text sets graduated administrative fines as multiples of the national minimum wage, from 7 to 70 for individuals on minor infractions and up to 500 for individuals and 4,000 for legal persons on the most serious. It also requires telecommunications operators to transmit any communication whose content is criminal or prejudicial to state security, which the opposition and part of civil society object to as leaving unclear which content qualifies and on what terms subscribers' personal data reaches the authorities, a year before the presidential election. No promulgation, gazette number or entry into force is on file. The vote followed a cyberattack on the incumbent operator and came days after the online-falsehoods law entered into force.	MOVEMENT
Legislation and regulation	**Legislation covering digital id**	The Council of Ministers approved a civil and criminal identification bill in April 2026, which would set the country's first dedicated identity-data regime. 2026-04-29 — the Council of Ministers approved a bill making the identity card the only valid document for banking, telecoms, school enrolment, property registration and contracts, and establishing the country's first dedicated regime for processing identity data. Voter cards, driving licences and passports are currently accepted as substitutes. No parliamentary stage has been recorded since. Two other instruments touch the same ground and neither is this one: an electoral registration law replacing in-person enrolment with automatic enrolment from the civil identity database, which reaches the base only through a secondary account with no gazette reference, and the data protection law reported above, which is the general regime the identity-specific one would sit beside.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Legislation and regulation	**Digital payments legislation**	A non-bank acquirer and sub-acquirer regime arrived in January 2026, on top of electronic money accounts and the 2022 payment services rules. Angola legislates payments by central bank notice, and three arrived in sequence. The 2022 notice on the provision of payment services sets the authorisation regime; an August 2025 notice governs electronic money accounts; and a January 2026 notice creates the non-bank acquirer and sub-acquirer, opening merchant acquiring beyond the banks. Underneath them sits the structural instrument: the 2017 notice classifying the settlement and clearing subsystems, which names what each rail is and who operates it. Value limits are set separately by instructive.	MOVEMENT
Legislation and regulation	**Legislation enabling data interoperability**	The 2015 civil registration simplification law is the earliest statutory basis: electronic communication of registration data to social security, health and tax. The enabling law predates the platforms by a decade. The 2015 law simplifying birth and civil registration provides for electronic communication of civil-registration data to the social-assistance, social-security, health and tax services, and requires a unified civil-registry database interconnected with civil identification, with data-protection oversight of the sharing protocols. Above it, interoperability is governed by decree rather than statute: the 2018 decree on public administration interoperability. Nothing in the window adds a statutory exchange duty, and the digital government bill went to public consultation in May 2026 without one being reported.	NO CHANGE
Legislation and regulation	**AI legislation / regulations**	An 86-article artificial-intelligence bill went to public consultation in September 2025, with no tabling, committee stage or vote since. The draft runs to 86 articles in nine chapters and departs from the tiered risk pyramid used elsewhere: a single critical-AI category carries registration, security-risk assessment and emergency-response duties, with extraterritorial reach over activity abroad affecting Angolan interests, a right to explanation and to refuse decisions made by artificial intelligence, and both criminal and strict civil liability. It repeals no existing legislation, defers military applications to a separate instrument and excludes scientific research and purely personal use. Its financial assessment is not costed. No tabling, committee stage or vote is on record in the eleven months since consultation opened, and the policy the law would implement does not exist: the readiness assessment reported under strategy names its absence as the central gap.	MOVEMENT
Legislation and regulation	**E-commerce legislation**	No dedicated electronic commerce statute. Parliament authorised an electronic signature regime in July 2026, the missing half of one. The framework is assembled from adjacent instruments rather than an electronic commerce act. The 2011 regulation on information society technologies and services is the oldest of them, and the general electronic communications regulation of December 2025 the most recent. What was missing was legal effect for signatures, and that moved in the window: parliament authorised the electronic signature and certification regime in July 2026, with the public key infrastructure and timestamp service already under construction. A startups law passed in March 2026 governs the companies rather than the transactions.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Legislation and regulation	**Statistics legislation**	The 2011 national statistical system law governs, with the statistics institute's organic statute renewed by decree in March 2026. The statute is settled: the law of the national statistical system, whose accessibility principle is what the institute cites when undertaking to release census results and microdata. No amendment to it has been located. What moved is the institution beneath it. The statistics institute received a new organic statute by presidential decree in March 2026, and a statistics development strategy for 2026 to 2032 was announced in June. Both sit under the 2011 law rather than replacing it, so the legislative position is unchanged while the machinery under it is not.	NO CHANGE
Legislation and regulation	**Access to information legislation**	The 2002 access to administrative documents law stands. A 2026 inspection regulation adds access to inspection files, invoking habeas data. The general statute is old and unamended: the 2002 law on access to administrative documents, in force as enacted. The movement is subordinate and specific. The regulation of state inspection activity, adopted by presidential decree in April 2026, embeds the principles of digital administration, data protection and confidentiality in the inspectorate's procedure; article 25 imposes duties of information and cooperation on public bodies, and article 46 gives the administered access to inspection files and certificates, invoking habeas data. It is the most recent instrument on the base creating a right of access to a class of government record, and it reaches one class only.	MOVEMENT
Data protection	**Data protection authority**	The authority published a third fine in August 2026, reaching commercial controllers outside the technology sector, with three of seven board seats filled. Enforcement is the movement. 2026-06-26 — millionaire fines were applied to two technology firms, and 2026-08-19 — a US$115,000 penalty followed against a hotel, which is the first published sanction against an ordinary commercial controller outside the technology sector. These follow a 2024 wave that included the incumbent telecoms operator. Deliberation texts and dates are not published and the newest penalty is reported in dollars rather than kwanza, so no running total can be stated in one currency. Its constitution is the standing weakness. Three of the seven board seats are filled and the four the National Assembly and the judiciary elect are not established as ever having been filled; every member is removable by presidential decree at any time and without stated grounds; and the body retains 60% of the fines and fees it levies, revenue onto which a pay decree moved most of each board member's salary from May 2024.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data protection	**National data protection readiness**	State surveillance runs without judicial warrant at any stage, and no rule states when the intelligence service may obtain identity, biometric or mobility data. The surveillance regime has been in force since April 2020: cellular location and electronic surveillance are authorised in writing by the public prosecutor, or by the head of the police body in urgent cases with notice within 72 hours, with no judicial warrant at any stage and execution running 90 days renewable. Private persons and businesses must open their own video-surveillance systems to the criminal police, and the data-protection authority is given knowledge and monitoring of the resulting police database rather than authorisation over it. Alongside it, video-surveillance installations are licensed by the minister responsible for public security and recordings are erased at 30 days unless a criminal-police or judicial body has requested them. 2026-08-15 — a civil-society report documents what is missing: no rule for intelligence access to identity, biometric or mobility data, no independent review of such requests, and a border-control system budgeted at US$112m and awarded directly, where the one functional post has discontinued fingerprint capture. The only evidence of use on file is a forensic confirmation that an intelligence service acquired commercial spyware and infected a journalist's phone.	NO CHANGE the gaps newly documented rather than closed
Regional collaboration	**Regional policy collaboration**	Regulators from four Lusophone states met in Maputo in December 2025 to map data governance gaps and launch the Portuguese toolkit edition. The clearest collaboration of the window is Lusophone rather than regional in the geographic sense. More than 40 senior data-protection authorities and communications regulators from Angola, Guinea-Bissau, São Tomé and Príncipe and Mozambique met in Maputo from 8 to 10 December 2025, working national data holdings and governance gaps against the continental data policy framework and the Smart Africa data governance blueprint, and launching the Portuguese edition of a data-governance toolkit. It builds on standing commitments: the Lusophone community's charter of digital rights and principles and a bilateral memorandum between the Angolan and Brazilian data-protection authorities. A university also joined the African engineering and technology network in October 2025.	MOVEMENT
Regional collaboration	**Regional legal harmonisation**	The continental cybersecurity and data protection convention was ratified in 2019; the Lusophone digital rights charter is the other standing commitment. Angola's harmonisation commitments are two and both predate the window. The continental union's convention on cyber security and personal data protection was approved by resolution in July 2019, and the Lusophone community's charter of digital rights and principles followed in 2024. The December 2025 workshop is where those commitments were worked into method rather than restated: regulators mapped national governance gaps against the continental data policy framework and the Smart Africa blueprint. No domestic instrument was amended to align with either commitment during the window, and the replacement data-protection law is still awaited.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Regional collaboration	**Shared regional infrastructure**	A neighbouring state operator began proof-of-concept testing on the Angolan satellite, a first step toward selling national space capacity across the region. 2026-08-25 — Mozambique's state operator began proof-of-concept testing of the Angolan satellite for telecommunications services in Mozambique, announced by the Angolan telecommunications ministry as a step towards a commercial agreement to distribute communication and broadcasting signals over Angolan space infrastructure. It follows the Mozambican public broadcaster's own proof of concept transmitting its television signal via the satellite, implements a bilateral memorandum signed in June 2026, and runs in parallel with a commercial pilot agreement with a Namibian operator for satellite-driven backhaul. Both trials are framed as advancing the ICT priority of the regional infrastructure master plan. No commercial terms are published, and neither trial has yet become a contract. This is the only case on the ledger of the country exporting digital infrastructure rather than importing it.	MOVEMENT
Regional collaboration	**Cross-border data transfers**	No adequacy list. The regulator assesses each transfer case by case under article 33 of the 2011 law, with re-notification whenever conditions change. The regulator's own standing statement is the authority here: the data-protection agency publishes no whitelist of countries it regards as offering an adequate level of protection, assesses adequacy case by case under article 33 of the 2011 personal data protection law, and requires a fresh notification under article 37 whenever any of the authorised conditions changes. The fee for it is set by a 2021 presidential decree. That makes every export of personal data an individual permission rather than a standing route, which is a heavier regime than the continental convention Angola ratified in 2019 requires. The announced replacement law is where that could change.	NO CHANGE
Standards	**National interoperability standards**	Interoperability is governed by the 2018 decree and built by contract; the territorial unit codification law of September 2025 supplies the one common key. No published interoperability standard, data dictionary or schema catalogue exists. What exists is an instrument and a platform: the 2018 decree on interoperability of the state administration, and a platform whose contract is reported at US$13 million with training terms of reference issued in February 2026. The window's real standards movement is a shared key rather than a shared format: the law codifying territorial units, of September 2025, which gives every register the same geographic identifiers. Sector-specific delivery standards exist in one industry, through the hydrocarbon data delivery regulation.	MOVEMENT
Standards	**National quality standards**	The standards institute is an international correspondent member publishing a 2026 catalogue with 140 new standards, voluntary unless legislation makes them binding. The national body is constituted and active. It is an international correspondent member, formed by the 2021 merger of the standards and accreditation institutes, and it published a 2026 catalogue incorporating 140 new standards, including texts arising from regional harmonisation and covering technology suppliers among other sectors. The institute states that Angolan standards are voluntary and become mandatory only where legislation makes them so in the public interest. Where a technical standard does bind, it binds by sector regulation rather than by the catalogue: the hydrocarbon data delivery regulation is the clearest example on this base.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Standards	**Adoption of international standards**	Domestic payments completed migration to the international messaging standard in July 2026, across the switch, the exchange and settlement participants. The clearest adoption of an international standard in the window is in payments: the central bank completed migration to the international messaging standard across the switch, the exchange and the real-time settlement participants in July 2026. That is a whole national system moved onto a global format. Elsewhere adoption is institutional rather than technical. The standards institute is an international correspondent member whose 2026 catalogue incorporates texts from regional harmonisation, and the meteorological service is required by its modernisation contract to register with the European meteorological satellite organisation to receive its broadcast stream.	MOVEMENT
Public debate and participation in policymaking	**Non-governmental contribution to national policy**	The artificial intelligence bill's consultation portal recorded 18 contributions from companies, 18 from specialists and 5 from the public by August 2026. There is a general duty and, for the first time on this base, a count against it. The administrative procedure code of 2022 requires administrative bodies to enable participation by individuals and associations in forming decisions, with hearing of interested parties and public consultation on draft regulations. The artificial intelligence bill is where that was exercised and measured. The ministry's consultation portal recorded 18 contributions from companies, 18 from specialists and 5 from the general public as at 27 August 2026, against a 20-page bill dated September 2025. The digital government bill went out to consultation in May 2026 without a comparable count published.	MOVEMENT
Public debate and participation in policymaking	**Open discussion of government policy**	A false-information law entered into force on 4 August 2026 carrying prison terms, and journalists' bodies warn it will inhibit citizen journalism. 2026-08-06 — the law was gazetted as Lei n. 6/26 and entered into force on 4 August 2026, after the National Assembly passed it 105 to 72 in May with only the main opposition against. It carries fines of 200 to 400 minimum wages, one to three years for simple publication, three to eight where it incites hatred or damages reputation, and up to ten in the aggravated case, and binds telecommunications operators, digital platforms and application providers, reaches content aimed at the domestic public from outside the country, and bans inauthentic accounts. 2026-08-22 — the journalists' union, the professional credential and ethics commission and the women journalists' forum warned that the law will inhibit citizen journalism, arguing that its penalties are excessive and that whether something counts as a journalistic error will depend heavily on how the courts and the aggrieved party read it. No enforcement action anywhere in the country is held, and civil society had raised the same objections as it came into force. The account of the text held is a law-firm note rather than the gazetted instrument.	REGRESSED

Finance

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Domestic budget appropriations and expenditure	**Sustainable domestic financing of digital transformation**	The communications programme was cut 30.5% for 2026 and cybersecurity by 54%, while US$275m and US$218.5m supplementary credits opened. The president authorised US$210.91m for an integrated set of state digital services (authorisation), with US$13m for the public administration interoperability platform (authorisation) and US$4.6m to strengthen state cybersecurity (authorisation). These are authorisations to spend, not disbursements. The recurrent lines fell. Kz 159.2bn was appropriated to the communications programme for 2026 against Kz 229.3bn for 2025, a cut of 30.5%, with fourth-generation expansion down 42% to Kz 62.7bn and the third-generation coverage line deleted. The cyber-security line fell from Kz 70.5bn to Kz 32.3bn, about 54%, read at draft stage before enactment. The identity programme was financed outside the budget cycle instead. US$218,500,000 of supplementary credit was gazetted to the justice ministry for identity-card universalisation, and US$275,000,000 was opened inside the 2026 budget for the adult-citizen database proof-of-life update, more than doubling the territorial administration ministry's allocation. Execution is the weak point. The first per-organ table published shows 3% first-quarter execution, with 20 of 50 programmes below 5%. No released, actual or audited figure is held for either budget year.	MOVEMENT
MoUs and other agreements	**Strategic relationships**	The data-protection authority signed a mutual-assistance memorandum with a Lusophone counterpart in September 2025, its first bilateral with a non-African regulator. 2025-09-18 — at a global privacy assembly, the authority signed a bilateral memorandum providing mutual assistance and technical, regulatory and supervisory cooperation. No bilateral with any non-African regulator was held before it. A stated intention to conclude a similar arrangement elsewhere is unevidenced, and no activity under the memorandum has been reported since signature. It is the only regulator-to-regulator instrument on this ledger; every other agreement recorded for the country is with a vendor, a lender or a foreign government, and those are reported under geopolitics.	MOVEMENT
New investments	**Mobilisation of non-state finance**	The incumbent operator's 15% stake sale raised about US$329m at 120.72% subscription, alongside a fintech investment and a private-credit fund. 2026-07-28 — 15% of the incumbent operator's capital and votes were sold for Kz 300.3bn, reported as about US$329m, at 120.72% subscription, creating 11,264 new shareholders, after the offering opened earlier in July. One consequence is regulatory: disclosure of the July cyberattack now runs under securities law rather than telecoms regulation. 2026-06-26 — a development finance institution invested in a mobility fintech, with no amount, instrument, tenor or stake disclosed. 2026-03-30 — the country's first private-credit vehicle for small and mid-market firms made a second deployment, anchored by a US$5m sovereign-fund commitment in 2024, with no fund size or investor list beyond the anchor published.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
New investments	**Development-partner project financing**	The digital acceleration loan reached US$112.21m disbursed of US$300m with both ratings lifted, while every outcome indicator still reads zero. 2026-06-10 — US$112.21m of the US$300m was disbursed at 10 June 2026, 37.40%, with both World Bank ratings lifted to Moderately Satisfactory, from ratings cut to Moderately Unsatisfactory in April 2025 with nothing disbursed. The loan was signed on 11 October 2024 on non-concessional terms carrying a front-end fee and a variable spread. Money moved and results did not. Every project outcome indicator read zero as at 30 April 2026 against March 2030 targets of 13,500,000 people using broadband internet, 10,000,000 with digitally verifiable identification, 100,000 trained through digital literacy programmes and 400 firms adopting digital technologies. 2026-09-07 - the higher-education programme entered the base with its digital content itemised: a US$150m loan and US$50m education-partnership grant, phase one of a US$550m multi-phase programme closing 31 December 2028, carrying US$10m to digitalise higher-education service delivery, US$15m to establish a national research and education network and US$15m to modernise the sector management information system. A second results-based funding round of US$20,470,284 across seven institutions was announced on 4 September 2026, with no per-institution split published.	MOVEMENT

ICT Infrastructure

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	**Mobile penetration**	A third operator installed 20 towers in an exclave province and enterprise 5G launched commercially; no national subscriber figure is published. 2026-08-19 — the third network installed 20 telecommunications towers in the exclave province of Cabinda with satellite backhaul agreed, stating commercial voice, data and satellite-linked service would start within days. No coverage percentage, investment figure, population reached or launch date is published, and "in the coming days" is the whole of the commitment held. 2026-07-23 — an enterprise 5G service launched commercially in the same province, with the capital at over 70% city coverage, about US$20m budgeted and every provincial capital targeted by 2027. This is enterprise connectivity rather than consumer mobile, and the throughput figures are the operator's own. 2026-06-11 — national roaming and infrastructure sharing extended voice and data to remote areas through shared towers, solar power and satellite backhaul, with no national site count, budget or target published. The standalone fifth-generation network remains at a trial call in a live environment with no commercial launch date, on a vendor release. No regulator return and no operator subscriber total appears anywhere on this ledger, so penetration itself is unmeasured.	MOVEMENT on network build, with no subscriber series on the base

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	**Internet usage**	55.5 per cent of individuals used the internet in 2024, on 12,785,472 broadband subscriptions at 36.4 per cent penetration. The regulator publishes the measured position: 55.50 per cent of individuals using the internet in 2024, 12,785,472 broadband subscriptions at 36.40 per cent penetration against 26,407,932 mobile subscriptions at 75.19 per cent, and national population coverage of 89.60 per cent at second generation, 85.66 at third, 77.41 at fourth and 16.40 at fifth. Fifth-generation coverage reaches three provinces of the then eighteen, and only the capital is at full coverage on the older generations. Nothing in the twelve months to September 2026 updates that measurement. What moved was supply rather than use: the national broadband programme and rural roaming and infrastructure sharing.	NO CHANGE
Connectivity	**Mobile affordability**	The second operator's prepaid data prices, quotas and validity periods changed on 23 October 2025. It is the only retail price list the base holds. Affordability here is evidenced by a tariff sheet rather than by an index. The second mobile operator's published prepaid data schedule states that updated prices, quotas and validity periods took effect on 23 October 2025. No basket, income-share measure or price index for Angola appears anywhere on the base, so what a gigabyte costs relative to income cannot be stated. The context the price sits in is the regulator's own: 26,407,932 mobile subscriptions at 75.19 per cent penetration against 36.40 per cent broadband penetration. The gap between those two numbers is where affordability would show up if it were measured.	MOVEMENT
Connectivity	**National fibre backbone**	Five official statements of fibre length run non-monotonic between 20,000 km and 30,000 km, and the base asserts no current national figure. The measurement is the finding. Official statements put the terrestrial network at 22,000 km in 2023, 20,000 in October 2025, 30,000 in November 2025, 22,000 in April 2026 and 28,000 in June 2026. The series is not monotonic and no definition accompanies any of the figures, so the base asserts no current national length. The regulator's annual statistical report that would settle it was dropped as unobtainable. The build behind the figures is equally opaque. The national broadband network was financed by a specific loan agreement of about US$249m signed in October 2023 and remains active with no delivery milestone published at either end. A domestic submarine cable to interlink the coastal cities and connect a transport corridor to an international system was stated as in preparation in March 2026, with no route, cost, financier or date.	MOVEMENT
Connectivity	**International internet bandwidth**	A new cable branch entered service with 23.6 Tbps allocated to Angola, and 1.0 Tbps was contracted through a neighbouring landing. 2025-12-13 — the 2Africa branch and its landing station were inaugurated and switched on, built by the incumbent for US$43m, with 23.6 Tbps of the cable's capacity allocated to Angola, replacing an end-of-life system and one already at capacity. The incumbent is the only Angolan member of the consortium. 2026-06-15 — the state operator signed a master service agreement for an initial 1.0 Tbps of dedicated capacity through a Namibian landing of the Equiano cable, with an option to assume ownership; design, testing, commissioning and handover are still to run, and the country reaches that cable only indirectly. Further submarine expansion is stated as ministry policy. No price, utilisation or wholesale capacity figure is published for any of it, so the base can state what has been added and not what it costs or carries.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	**Internet Exchange Points**	Two active exchange points with 29 members between them, present in one of the fourteen population centres above 300,000. The tracker's position is that Angola has two active internet exchange points with 29 members between them, present in one of the country's fourteen population centres above 300,000 people. Domestic peering therefore exists but is concentrated in a single city, and traffic between networks elsewhere in the country still travels to reach it. Nothing in the window records a third exchange, a new member or a peering policy. The infrastructure that would feed one continued to grow — the national broadband programme and submarine fibre expansion — without a stated intention to distribute exchange capacity beyond the capital.	NO CHANGE
Connectivity	**Satellite broadband licensing and availability**	A low-orbit licence reached a multi-year capacity agreement and a first reseller was licensed on the national satellite, while one application is unresolved. 2026-06-12 — the country's first and only licensed low-orbit operator, granted a 15-year licence in June 2025 with a Luanda ground station, moved from licence to commercial deployment through a multi-year capacity agreement with a local provider. 2026-07-02 — on the national satellite, a commercial access hub opened in December 2025 with 37 firms in the integration process by April 2026, and a first startup was licensed to resell access. Bandwidth, pricing and operator access terms remain undisclosed. 2026-08-03 — the largest low-orbit operator is still unlicensed, with a secretary of state saying only that the process is under way and the regulator still working out how to fit low-orbit operators into a regime written for terrestrial networks. Sixteen months of identical status is the finding, the position being unchanged since the ministry said negotiations were continuing in April 2025.	MOVEMENT one operator now commercially deployed while another application stands unresolved
Data Storage	**Local data centre capacity (all providers)**	A commercial data centre opened at up to 3 MW over more than 800 racks, while the only Tier IV project has produced nothing since 2023. 2025-10-02 — the country's first Tier III commercial facility opened at up to 3 MW and more than 800 racks over 19,000 square metres on US$30m, near the cable landings, with a plan to exceed 7 MW within five years. Its operator contracted six times as much power across its group in the first half of 2026 as a year earlier. Against it, a second commercial project announced in 2023 as the country's first Tier IV facility at over 10 MW and 2,000 racks, financed but not built, has no source since and never had a stated completion date. Three years of silence on the only Tier IV project in the country is the counterweight to one facility opening.	MIXED a Tier III commercial facility in service while the only Tier IV project has been silent for three years

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Storage	**Local data centre capacity (national providers)**	The government data centre was inaugurated in April 2026 at 208 racks and 1,040 kW, carrying a national cloud under a mandatory migration. 2026-04-28 — the President inaugurated the government data centre: 6,225 square metres, Tier III design, 208 racks and 1,040 kW live in a modular design of about 336-rack capacity, reported at about US$89m, from about 75% complete in November 2025, with a second account giving about US$90m and no kwanza original published. The same day, a unified government cloud entered operation under a progressive and mandatory migration of public services, framed as repatriating passports and education certificates from foreign platforms, against a first stone laid in September 2025 with a migration mandate stated and nothing yet to migrate onto. No source records how much has actually migrated, so the capacity is established and its use is not. 2026-09-02 — a commercial operator disclosed a data centre installed at Lobito as the technical support and data-management platform behind its coastal internet and television services (inauguration). No capacity, rack count or power figure accompanies it, which is the same silence the fibre-length series shows: facilities are announced and none of them is measured.	MOVEMENT
Data Storage	**Off-site backup capacity**	A backup and cloud centre of 48 racks was reported for government in August 2026, with the satellite operator supplying data-centre redundancy. Backup moved from absent to named in this window. A government backup and cloud centre of 48 racks was reported in August 2026, alongside requalification of an existing facility, and the national satellite programme supplies redundancy for the national data centre. It sits on an estate that already had two poles: the national cloud across two government data centres and the centre inaugurated in April 2026. Commercially there is a second operator building capacity. No recovery-time objective, restore test or retention rule is published for any of it.	MOVEMENT
Energy	**Sufficient energy and water for data centres**	A US$1.5bn, 1,200MW line to carry surplus Angolan hydropower to the DRC was agreed in October 2025; no domestic data-centre load figure is held. 2025-10-14 - a New York-based energy investor and the DRC government signed a memorandum of understanding for a 1,150 km, US$1.5bn, 1,200MW transmission line carrying surplus Angolan hydropower to the DRC, targeted for completion in 2029 and aimed principally at the Copperbelt mining sector. Angola is the source of the power and not a party to the memorandum on the record, and no Angolan offtake, tariff or financing close is published. Nor does the base hold any figure for data-centre load, generation headroom or water use in Angola, so what a 1,200MW export commitment leaves for domestic digital infrastructure cannot be stated here.	NO CHANGE a first record of an export commitment with no domestic load figure behind it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Energy	**Grid reliability**	Five high-voltage towers fell on 16 December 2025, cutting power to much of two provinces for more than a day, against transmission projects still in planning. The window's evidence on reliability is an outage. Five high-voltage towers fell on 16 December 2025, leaving much of Cuanza-Sul and Benguela without power for more than a day before supply was restored on 18 December. A single line failure taking out two provinces is a statement about redundancy as much as about the towers. Against it, the reinforcement projects remain prospective: the cross-border transmission line to the neighbouring country is at planning stage, and the electrification targets of the power sector plan are unchanged. The census puts household access where it does, and rural access remains the binding limit on anything digital outside the cities.	MIXED
Energy	**Rural electrification**	Household access reached 48.6% at the 2024 census, 8.5% rural, while the 60% target for 2025 passed unmeasured. 2025-11-20 — definitive census results put household access to electricity at 48.6% at the 2024 reference date, 68.9% urban against 8.5% rural, from 31.9% at the 2014 census. That is the physical floor under every system named in this report. Against it, a Power Sector Action Plan target of 60% electrification by 2025, from 47% in 2020, reached its target year with no electrification rate published since the 2020 baseline. The census figure is a different measure on a different definition and cannot be read as the outturn. The rural figure is the one that matters for the connectivity and registration programmes reported elsewhere: at that level, mains power is not an assumption a rural service can be designed on.	MIXED household access rose across the census cycle while the electrification target year passed with no outturn published
Technical Capacity	**Robustness of government hardware and software**	The state information systems institute holds the mandate over the state network, the national data centre and the government domains. No inventory or availability figure is published. Accountability for the state's own estate is clear and its condition is not. The 2021 organic statute of the state information systems institute gives it the state private network, public information-technology infrastructure, the national data centre, interoperability, the country and government domains and cybersecurity functions, revoking the 2016 statute. What that institute has built in the window is visible: a government data centre inaugurated in April 2026 and a 48-rack backup and cloud centre reported in August. What is not published is any measure of robustness — no equipment inventory, refresh cycle, availability figure or incident record for government systems, in a country where the incumbent operator spent August 2026 restoring services after a cyber attack.	MOVEMENT
Technical Capacity	**Local capacity to maintain, manage and develop government systems**	The statistics office built its census portal and mobile application with its own staff, and the tax authority states it builds and feeds its risk-analysis system in-house. Two agencies report building their own systems. 2026-07-02 — a public census portal carrying demographic, social, economic and housing indicators by geographic level, plus a mobile application with macroeconomic series, was built by the statistics office's own staff. 2026-02-11 — the tax authority states that it builds and feeds its machine-learning risk-analysis system in-house, with no model, supplier or accuracy figure published. Everything else of scale is contracted out, and the two largest identity and interoperability procurements of the window are reported under data exchange and digital identity. Nothing on the ledger states a headcount, a skills audit or a retention position for government technical staff, so the two in-house builds are the whole of the evidence either way.	MOVEMENT on two in-house builds

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Cybersecurity	**National cybersecurity readiness**	A strategy, a council and a cyber centre were created by decree, none with an operating record, while an attack took the incumbent's services down for nine days. The instruments arrived together. A national cybersecurity strategy was gazetted on 3 December 2025 with six strategic objectives and a two-phase legislative reform, a consultative national cybersecurity council chaired by the President was created by decree the same day, and a national cybersecurity centre was constituted as a public institute with regulatory, supervisory, inspection and sanctioning powers, an emergency response team and a round-the-clock operations department, retaining 30% of the fines it levies. None has an operating record: no source records the council convening or the centre exercising any power, and in August 2026 the responsible minister was still describing the centre's launch in the future tense. The cybersecurity fund its statute presupposes is created by no instrument on file. The operational test went badly. An attack on the incumbent from the early hours of 28 July 2026 took voice, messaging, mobile data and internet down nationwide until 5 August, nine days, with full restoration declared on 21 August bar one feature and automatic compensation to customers. Every account is the operator's own; no regulator finding, attacker, vector or outage cost is published. Analysts argued afterwards that telecommunications should be designated critical infrastructure; no designation instrument exists.	MIXED a strategy, a council and a centre created on paper while the budget was cut and a national outage ran nine days

DPI

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Exchange	**National data exchange system**	A US$150m contract for the interoperability platform, digital signatures and digital identity entered execution on 31 July 2026, by sole-referenced award. 2026-08-04 — a US$150m twelve-month contract entered execution on 31 July 2026 for a secure-zone critical-computing component hosting the interoperability platform, key-based electronic signatures, digital identity and structured cybersecurity, financed under a presidential order and inscribed in the 2026 public investment programme. The contract itself was signed in June 2026 and carried in the year's investment programme. It is a sole-referenced state technology award under a presidential order, with the procurement route unstated. No national interoperability platform was in service before it, and no technical standard, published interface or exchange volume is on file — so the country has a contract for an exchange layer and not yet the layer.	MOVEMENT
Data Exchange	**Use of digital id in other systems**	The tax authority now serves its compliance certificate to other state bodies, and a US$28 million digital identity platform is under construction. The statutory basis is a decade old: the 2015 civil registration simplification law provides for electronic communication of registration data to the social-assistance, social-security, health and tax services and requires the civil registry to be interconnected with civil identification. Two things realise part of it. The tax authority's compliance certificate is served to other state bodies through interoperability, which is the base's clearest working instance of one register consuming another. And a single digital identity platform valued at US$28 million is being built under the digital acceleration project, with the taxpayer number and unique student identifier as the sectoral keys it would have to reconcile.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Exchange	**Interoperability of health systems**	The health information system moved onto a common platform with the world health body in April 2026, with the vaccination registry on the same stack. Health is the sector where exchange is furthest along, because both systems were put on the same platform. The national health information system was integrated through a partnership with the platform's developers and the world health body in April 2026, and the electronic vaccination registry runs on the same stack. Capture at the edge is being extended to match: municipal and provincial technicians were trained on the electronic surveillance tool during vaccination week in April 2026, with extension to all municipalities planned. What is not published is any exchange between health and the civil registry, despite the 2015 law providing for it.	MOVEMENT
Data Exchange	**Interoperability of education systems**	A unique student identifier was created by decree in November 2025, and a national education database was named in August 2026. Education acquired the two things exchange needs, in order. The presidential decree of November 2025 on school records created a unique student identifier, which is the key. The national education database was named and described in August 2026, which is the store, and the higher-education system trained focal points across institutions in September 2025. Exchange with the registry side is being forced by a practical problem rather than designed: a ministry circular of August 2026 allows enrolment of children without identity documents, which is what a school system does when it cannot yet query the register.	MOVEMENT
Data Exchange	**Interoperability of social protection systems**	The single social register, not operational in June 2024, was launched as a centralised platform in July 2026 with stated articulation to civil registries. The two ends of the window bracket a real change. The financier's status report recorded the single social register still not operational as of June 2024, while integration of the cash-transfer programme's management information system with the social-action ministry's own system was well advanced and that system was available in 54 social action centres. In July 2026 the register was launched in modernised and expanded form, with biometric, facial-recognition, georeferencing and documentary validation, one record per citizen, and stated articulation between social programmes, local administration, civil registries, public institutions and sectoral databases; a pilot phase began at Sumbe in August. What is stated is articulation; no exchange is yet reported running.	MOVEMENT
Digital Identity and CRVS	**Robustness of system**	A tender opened for a US$28m national digital identity and electronic signature platform, separate from the card, which is now generated from the birth record. 2026-08-14 — the President authorised US$28m and formally opened a public tender for a National Digital Identity and Electronic Signatures Platform, specified to support up to 30 million digital identities and to let citizens, firms and public officials use a single digital credential for public services, digital contracts, electronic verification of customers and legally valid electronic signatures. It was named as a workstream in the 2024 loan agreement with nothing built. No supplier, timetable or relationship to the separately recorded public digital infrastructure contract is stated. The physical credential is distinct and unchanged: in issue nationwide and generated from the birth record by system interoperability, on a foreign-built platform running since 2017. What moved on it is its measurement and its proposed legal monopoly, both reported elsewhere in this report.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Identity and CRVS	**Registration of entire population**	The census put card coverage at 52.4% of those aged five and over, leaving 14.9m undocumented, against a universalisation plan now printing in all 21 provinces. 2025-11-26 — the first national coverage figure the base holds puts 52.4% of the population aged five and over as holding the card, 63% urban against 30.9% rural, leaving 14.9m people undocumented, drawn from the 2024 census definitive results. Before it, a 2023 diagnostic said only that the country was far from universal coverage. The movement is in measurement rather than in coverage. Issuance capacity did move. A universalisation programme runs printing posts in all 21 provincial capitals with two to three printers per province planned, mobile brigades in remote municipalities and three phases covering unregistered adults, cards at birth and replacement of degraded documents; one provincial campaign issued and delivered more than 4,000 cards in 16 days in a single municipality, and the ministry has been opening identification posts through the year. Collection is the leak. More than 120,000 issued cards were awaiting collection at identification posts nationwide in July 2026, the first such figure held and with no prior series to read it against.	MOVEMENT on issuance capacity, with coverage measured for the first time rather than raised
Digital Identity and CRVS	**National maintenance of id and credentials systems**	Card printing moved from a single national centre to all 21 provinces from 1 July 2026, on a platform built abroad since 2017. 2026-07-01 — all 21 provinces began printing the identity card locally, with two to three printers per province planned and a 24-to-48-hour issuance target; one province reports issuance under 24 hours against one to two weeks before, and the same decentralisation reached the exclave province in July. This is printing only: enrolment and biometric capture are untouched. Underneath it, the card has been issued on a foreign-built platform since 2017, and the digital identity platform now out to tender is also to be procured rather than built. No source states who maintains either system, what the support arrangements are, or whether source code or operational control sits with the State — which is the question this indicator asks and the record does not answer.	MOVEMENT on printing capacity, with the platform itself foreign-built
Digital Identity and CRVS	**Authentication**	Parliament granted legislative authorisation for an electronic signature and certification regime, and a public key infrastructure was contracted ahead of it. 2026-07-30 — parliament unanimously approved legislative authorisation to the President, valid 90 days after publication of the enabling law, for a regime defining an accrediting authority, a root certification entity and the evidential weight of an electronic signature, grounded on the insufficiency of two 2011 instruments. The substantive text will be an executive instrument and is not yet made. The technology is ahead of the law. A public key and time-stamp infrastructure was announced as a ministerial intention in June 2025 with nothing contracted and no legal basis; it is now contracted as a component of the US$150m public digital infrastructure project, and the tax authority is already running mandatory electronic invoicing on it in practice. The trust layer is being built ahead of the law that would govern it.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Identity and CRVS	**Digital id from birth**	Registry posts opened in maternity wards in one province so newborns leave registered and issued a first identity card, with no national rollout published. 2026-03-04 — registry posts in maternity wards were launched in one province, running there since October 2025, so that newborns leave registered and issued a first identity card, foreign-funded with United Nations support, following the start of card issuance to newborns in November 2025. No national rollout map, no registration count and no target is published, so what the base holds is one province and a stated model. The universalisation programme reported under registration names cards at birth as one of its three phases, which is the nearest thing to a plan on file. The measure that would test it runs the other way: birth registration among children aged nought to four is the weakest cohort in the census, reported under the civil register.	MOVEMENT
Digital Identity and CRVS	**Interoperability of birth registration and digital id**	The identity card is generated from the birth record by system interoperability, a link standing since 2017 and unmeasured since. The link exists and is old. The card is generated from the birth record by system interoperability, on a platform installed with foreign assistance in 2017 that tied card issuance to birth registration from the start. Nothing in the twelve months to 2026-08-26 states how well it works. No figure exists for how many registrations produce a card, how long the step takes, or what happens to the 39.2% of children aged nought to four registered at the 2024 census — the population the link is supposed to serve. The maternity-ward posts reported above are the operational answer being built, and they are in one province.	NO CHANGE
Digital Identity and CRVS	**Use by other systems**	A bill would make the identity card the only valid document for banking, telecoms, school enrolment and contracts, and a law makes it the sole electoral credential from 2027. 2026-04-29 — the Council of Ministers approved a bill making the identity card the only valid document for banking, telecommunications, school enrolment, property registration and contracts, replacing an arrangement in which voter cards, driving licences and passports are accepted substitutes. No parliamentary stage has followed. Separately, an official electoral registration law replaces in-person enrolment with automatic enrolment drawn from the civil identity database, with the voter card used for the last time in 2027 and the identity card becoming the sole registration credential thereafter. No gazette reference is on file and the law reaches the base through a secondary account. Both make the card load-bearing for services it does not yet reach: 52.4% of the population aged five and over holds one. Nothing on the ledger records an authentication service, an interface or a verification volume behind either instrument.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Payments and Fintech	**Governance role of central bank**	The central bank completed migration of domestic payments to the international messaging standard on 10 July 2026, across the switch, exchange and settlement participants. 2026-07-16 — the central bank announced completion of the migration of domestic payments to the ISO 20022 messaging standard on 10 July 2026, across the switch, the exchange and the real-time settlement participants. Only the completion is dated. No programme start, scope document or cost is held, and no participant count, message volume or exception rate is published, so the base records that the migration finished and nothing about what it changed. It is the one act of payments-system governance on this ledger for the window. The instant payment scheme and the regional settlement arrangement reported below both run under this bank, and neither carries a supervisory statement, a scheme rulebook or an oversight report on the base.	MOVEMENT
Digital Payments and Fintech	**G2P functionality**	The cash-transfer programme reached more than 1.3 million households and about 6.5 million citizens, against 247,000 households at the prior position. 2026-07-25 — the programme is reported at more than 1.3 million households and about 6.5 million citizens reached, with a single social register now the centralised targeting database, against a starting position of a US$320m loan building the social registry and government-to-person rails, with more than 247,000 households reached against a 1.6 million family target. That is the largest measured government-to-person payment operation on this ledger by an order of magnitude. What is not published is the payment instrument: no source states how the transfers reach households, what share is paid into a wallet or an account rather than in cash, or what it costs to deliver. No data-protection basis or governing instrument was stated for the register at launch, which is reported under registries.	MOVEMENT
Digital Payments and Fintech	**Revenue collection**	Mandatory electronic invoicing reached 51,245 enrolled taxpayers and 36,341,801 invoices by August 2026, covering large taxpayers and state suppliers. 2026-08-23 — 51,245 large taxpayers and state suppliers were enrolled and 36,341,801 invoices issued, against a mandate in force from 1 January 2026 after an earlier postponement and with no enrolment figure published before this one. The figures are the tax authority's own and the mandate covers large taxpayers and state suppliers rather than all taxpayers, so this is neither universal coverage nor an independently verified count. The enforcement side is blunt and already live: a taxpayer not invoicing electronically cannot be paid by the State. It is the largest transaction volume of any government digital system on this ledger, and it runs on a public key infrastructure that has no governing law, reported under authentication.	MOVEMENT
Digital Payments and Fintech	**B2B and B2G functionality**	The corporate rail moved: 31 million credit-transfer operations in 2025, up 37.8 per cent, over subsystems the 2017 notice classifies. The rails are defined and the traffic on them is now published. The 2017 notice classifies the real-time gross settlement system as systemically important and the card switch, credit-transfer, cheque-clearing, direct-debit and multicaixa subsystems as relevant, naming the central bank and the interbank services company as operators. The operator's own 2025 figures show the corporate rail growing: the credit-transfer system processed 31 million operations, up 37.8 per cent, while instant transfers grew more than tenfold to nearly 35 million operations and code-based payments passed 53 million. Government-to-business payment specifically is not broken out anywhere, though mandatory electronic invoicing now sits alongside it.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Payments and Fintech	**P2P, P2G and P2B functionality**	The instant payment scheme is wallet-led, with the largest wallet at 52.2% of transfers and 66.4% of transfers under Kz 10,000. 2026-03-05 — the monthly operator report puts the scheme as wallet-led and concentrated: the largest wallet at 52.2% of transfers, more than 12.3m registered accounts, about 24.8m active payment keys, and 66.4% of transfers under Kz 10,000, against 35m transfers and Kz 590bn over 2025 across 22 banking and non-banking institutions. The small-value share is the finding: this is retail person-to-person traffic, and the concentration in one wallet is a single point of failure the record does not discuss. The base holds no launch date and no figure dated before 2025, so the growth rate cited by the operator cannot be checked against an independent series. Nothing on the ledger covers business-to-business or business-to-government payment functionality except through the tax authority's invoicing mandate, reported under revenue collection.	MOVEMENT
Digital Payments and Fintech	**Population uptake**	Financial inclusion stood at 51.7% in the first quarter of 2026 against a 65% target for 2027, with banking at 32% and digital payments up about 56%. 2026-07-09 — a state minister's scorecard puts financial inclusion at 51.7% at the first quarter of 2026 against a 65% target for 2027, banking at 32% or 5.7m people, and mobile and digital payments up about 56% year on year. The strategy behind the figures launched in December 2025 and no pre-strategy baseline is held, so the target is measurable and the movement toward it is not. The bancarisation figure has no series behind it either: a 2023 industry account put roughly half the population unbanked on a different base, and the two cannot be read as a trend. The next phase is stated as letting mobile and digital payment providers extend credit, which would move the same population from payments into lending with no consumer-protection instrument on this ledger behind it.	MOVEMENT
Digital Payments and Fintech	**Cross-border functionality**	The kwanza became the second settlement currency in the regional payment system on 27 July 2026, against about US$3.77bn of flows with member states. 2026-07-28 — the two central-bank governors formally introduced the kwanza into the regional real-time settlement system, the second settlement currency in its history, against 2025 trade and interbank flows with the other fourteen member states of about US$3.77bn across nine currencies, after integration was announced in May. The system had cleared in one currency since 2013. No volume settled in kwanza has been published since, and no retail cross-border service appears anywhere on this ledger: this is interbank settlement, not remittances or merchant payments. What it changes is which currency regional trade can be invoiced and cleared in, and the test of it will be a settled-value series that does not yet exist.	MOVEMENT
Digital Payments and Fintech	**Consumer protection**	The 2016 conduct-of-business notice governs sale, information duties, complaints handling and direct recourse to the central bank. Financial consumers are covered by an instrument with real machinery in it. The central bank's 2016 notice on the marketing of financial products and services sets rules on marketing and sale, information duties, fair treatment, customer service and complaints handling, with direct recourse to the central bank, and expressly revokes the 2011 and 2012 notices before it. The general consumer route runs elsewhere and is weaker: the mandatory complaints book, enacted by decree in 2016, remains a physical book of 77 carbonless pages, with the online channel run under the consumer institute's mandate from it. Nothing in the window amends either, and no complaint volume or resolution rate is published for payments.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Registries	**Population register**	A presidential decree created an interministerial commission to de-duplicate and update the adult-citizen database, carrying a US$275m supplementary credit. 2026-06-08 — a presidential decree created an interministerial commission to stabilise civil-identification and adult-citizen database interoperability, biometrically de-duplicate, update residence and consolidate the electoral base. No technical standard, interface or completion date is on file. 2026-02-26 — the money came first: US$275,000,000 was opened inside the 2026 budget for the proof-of-life update of the adult-citizen database, more than doubling the territorial administration ministry's allocation, on reporting rather than a held gazetted order. The register is the base of the electoral roll, which is why the proof-of-life operation reported under the electoral register is contested. A biometric de-duplication of the adult population, financed at this scale and governed by a commission rather than a statute, has no data-protection basis stated anywhere on this ledger.	MOVEMENT
Registries	**Civil register**	Birth registration reached 63.0% overall but only 39.2% among children aged nought to four, with registration posts rehabilitated in two provinces. 2025-11-20 — census definitive results put birth registration at 63.0% overall and 39.2% among children aged nought to four, from 53.5% and 24.8% at the 2014 census. Both rose, and the gap between them is the finding: the pipeline that feeds the identity card is under-registering the newest cohort fastest. 2026-04-06 — under a US$250m local-governance project, eleven birth-registration posts were rehabilitated in one province with five operating since August 2025, thirteen more were nearing completion in another, and mass registration campaigns reached several thousand people, on a project running across eight provinces and 53 municipalities. Only two provinces have published delivery counts. Nothing on the ledger states a national registration target, a backlog figure or a death-registration rate. The education ministry made school enrolment independent of documentation: circular 05/2026 of 19 August 2026 orders every school teaching primary and first-cycle secondary education to enrol children holding no birth certificate and no identity card, and to compile by the end of October a survey of undocumented pupils for the justice ministry's registry directorate, whose services are then to travel to the schools and register them (circular).	MOVEMENT though the youngest cohort is registering worst
Registries	**Address register**	No national address register. The 2019 toponymy regulation makes place names and house numbers a municipal function. Addressing exists as an administrative act rather than as a database. The 2019 regulation of the toponymy law governs the assignment and alteration of place names and the assignment or suppression of house numbers across every territorial unit, and vests execution in the municipal administrations. There is no single consolidated national address register, and this is the closest enacting act to one. Two things in the window make one more tractable. The territorial unit codification law of September 2025 gives every administration the same geographic keys, and the single social register launched in July 2026 records georeferencing among its validations. Neither is an address register.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Registries	**Business register**	The one-stop company counter reached Huambo in June 2026, and parliament approved the beneficial ownership bill in May. The register itself is old and its reach is what moves. Company formation was simplified by the 2015 law, and the one-stop counter that implements it opened a new service at Huambo in June 2026. The larger change is what the register will have to hold. Parliament approved the beneficial ownership bill in May 2026, which adds a layer the company register has never carried. A separate decree of February 2026 provides a digital platform for industrial development poles. No count of registered companies is published at any date.	MOVEMENT
Registries	**Social protection register**	A single social register launched in the capital in July 2026 as the centralised targeting database, with no governing instrument stated. 2026-07-25 — a single national social registry launched to map vulnerable households and act as the centralised database directing social supports, replacing a position in which social-transfer targeting rested on one programme's own registry. No enrolment target, data-protection basis, interoperability plan or governing instrument was stated at launch. That is the whole of the record: a database of the country's poorest households, built to direct payments to them, with nothing published about who may read it, how long it holds what it holds, or which other system it connects to. The transfer programme it now targets is reported under government-to-person payments, and reached about 6.5 million citizens.	MOVEMENT
Registries	**Electoral register**	A proof-of-life operation runs 254 of a planned 634 counters against a universe of 16,707,455 citizens, and four opposition parties demand an independent audit. 2026-06-15 — the proof-of-life operation to update the electoral register opened. By August, 254 of a planned 634 counters were live across all 21 provinces and the diaspora, with 10,747 field workers against a target universe of 16,707,455 citizens, and over 730,000 updated nationally on the opposition's count. The count is the problem. The electoral administration has published no enrolment figure since the operation opened, so the only national number the base holds comes from a political declaration by four parties that are contesting the operation. They allege administrative discretion, uneven deployment of registration brigades and recurring biometric-system failures, and say the administration refuses to release statistics disaggregated by province, municipality and commune, which blocks any audit of the register's real flow; the electoral commission had earlier refused accreditation to a civic monitor. None of it has been adjudicated and no official series exists to test it against. At provincial level, one government reports over 40,000 residents updated and is pressing mining-sector workers to register through one-stop service desks. Ahead of all of it, a law replaces in-person registration with automatic enrolment from the civil identity database, with the voter card used for the last time in 2027.	MOVEMENT contested
Registries	**Tax register**	More than 50,000 taxpayers had joined electronic invoicing by August 2026, on a taxpayer number governed by a 2021 decree. The register's legal basis is the 2021 decree establishing the legal regime of the taxpayer identification number, with procedures set out in the tax offices' 2026 procedures manual. What moved is what the register is used for. Mandatory electronic invoicing came into force in January 2026 after a postponement, and by August more than 50,000 taxpayers had joined it. The authority also began serving its compliance certificate to other state bodies. No total registration count is published.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Registries	**Land register**	A digital platform linking the cadastre, the tax authority and the property registry targets 40,000 properties legalised by end-2026, with no progress published since. 2026-04-17 — a digital platform linking the cadastre, the tax authority and the property registry was set a target of 40,000 properties legalised by the end of 2026, aimed at cutting duplication and enabling mortgage access. No progress figure against that target has been published in the four months since, and no source states whether the platform is in service, which agency operates it or how the three registries it links exchange data. A target with no reporting against it is the same shape of evidence as the digital transition agenda's project count: a number the government publishes about its own intentions. It is the only land or property system on this ledger.	MOVEMENT
Sectoral management information systems	**Health**	The vaccination registry is in use across all national campaigns, with interoperability to the national health information system still under development, and a regional surveillance operation closed in November 2025. 2026-02-14 — the vaccination registry is described as in use across all national vaccination campaigns, with interoperability to the national health information system under development. It was already in use for real-time individual vaccination registration at the start of the window, so the position is unchanged. A secretary of state's conference remarks are the only source. No coverage figure, record count, facility count or evaluation is published, and no other health information system appears anywhere on this ledger — no electronic medical record, no health facility registry and no laboratory or supply-chain system. The one prospective addition is a vendor memorandum on digital health reported under geopolitics, against which no delivery has been reported. 2025-11-30 - the World Bank's implementation completion report closed REDISSE Phase IV, a US$280m five-country regional disease-surveillance operation carrying a health information and ICT subcomponent at 14% of the sector share and naming DHIS2, IDSR and EWARS among its systems. The held capture is an excerpt: it states no country-specific system, coverage or outcome, so what the operation left behind here is not on the record.	NO CHANGE
Sectoral management information systems	**Education**	A national education database initiative launched in August 2026 under a five-year, thirty-country data challenge, alongside a national education and research network. 2026-08-19 — a structured multi-year effort with the education ministry, a continental education association and an in-country technical partner launched to strengthen the national education database and the capacity to turn statistics into policy, under a five-year, thirty-country data challenge, presented at a Luanda event in early August. No data-quality baseline, scope, budget or completion date is published, and no contract or programme document is held. 2026-05-14 — separately, a national education and research network was presented alongside an executive roadmap for higher-education digital transformation, with no connected institutions, capacity, funding or operating date stated. Both are announcements of intent. Nothing on the ledger records an enrolment system, a school census platform or a teacher registry in operation. 2026-09-07 - the research and education network is funded rather than only announced: US$15m within the tertiary education project to establish it and upgrade university networks, with the draft network recorded as under way in the lender's April 2026 implementation report. No operator, governance model, connection count or commissioning date is published.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Sectoral management information systems	**Social protection**	Cash-transfer and ministry systems were integrated and available in 54 social action centres by June 2024; the register above them launched in July 2026. The management systems were built before the register they were meant to feed. The financier's status report records that integration of the cash-transfer programme's management information system with the social-action ministry's own system was well advanced and that system was available in 54 social action centres as of June 2024, while the single social register was still not operational. That order was corrected in this window. The register launched in modernised form in July 2026 and began a pilot phase at Sumbe in August, underpinning a cash transfer reaching more than 1.3 million households. No caseload figure from the management systems themselves is published.	MOVEMENT
Sectoral management information systems	**Justice**	The apex court's technical sessions recommended phased digitalisation of the courts in October 2025. No case-management system is named anywhere on the base. The judiciary stated a position for the first time. The conclusions of the supreme court's technical and scientific sessions of 14 to 17 October 2025 recommend phased digitalisation of the courts, technological capacity building and data protection. That is the leadership of the court system asking for the thing, which is a different order of evidence from a ministry plan. What follows from it is not yet on the base. No court case-management system, filing platform or docket database is named; no budget line is attached; no date is given. The nearest working comparison is the audit court's electronic filing of public accounts, approved in June 2026, which shows the state can put a national filing flow online when it decides to.	MOVEMENT
Sectoral management information systems	**Tax**	Tax-compliance certificates are automated inside the tax authority, with extension to banks and other state bodies under way. 2026-02-10 — customs clearance was automated for compliant taxpayers inside the tax authority, with extension of the compliance certificate to banks and other state bodies under way. No baseline was published before it. The order of arrival is worth recording: the enforcement side is already live — a taxpayer not invoicing electronically cannot be paid by the State — while the interoperability the enforcement rests on is still being built. The authority is separately phasing out paper documents. This is the most operationally advanced sectoral system on the ledger, measured by the volumes reported under revenue collection, and it is also the one running furthest ahead of the legal instruments that would govern it.	MOVEMENT
Sectoral management information systems	**Customs**	A logistics single window is to absorb the port, foreign-trade and customs platforms into one, with phase one expected between late 2026 and mid-2027. 2026-07-28 — an integrated logistics single window was announced to absorb three separate agency platforms into one, framed explicitly as a formalisation and tax-base instrument rather than as trade facilitation, with phase one expected between the second half of 2026 and the first half of 2027. A board communique is the only source. No instrument, budget or vendor is named, and no baseline is published for what the three existing platforms handle. The framing is the notable part: a customs and logistics integration justified by revenue rather than by clearance times, which is consistent with the tax authority's other work reported above.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Sectoral management information systems	**Land**	A digital platform legalised 40,000 properties and a single window for land rights opened in September 2025. Land is one of the better-served registers here. The property cadastre's legal regime dates from 2021, and in April 2026 a digital platform was reported legalising 40,000 properties — a throughput figure of the kind most Angolan registers do not publish. Access to it was consolidated a few months earlier, when a single window for the concession of land rights was launched in September 2025. What the base does not hold is the register's coverage: no parcel count, no proportion of national territory surveyed, and no statement of how the platform relates to the municipal house-numbering function.	MOVEMENT
Other GovTech and e-Gov	**e-government services**	No inventory of online services exists — the transition agenda counts projects, not services — while an at-home identity-card service and a public-finance programme launched. What is missing first: no service catalogue is published and the transition agenda counts projects rather than services, so the count of public services available online is not knowable from the record. 2026-07-28 — an at-home identity-card service launched in one province at Kz 250,000 for at-home processing and Kz 10,000 for delivery alone, on a 48-hour issuance target, with requests through a web portal and a messaging number. The ministry called the fee a product of exclusivity, and no ministry publication naming the portal is on file. 2026-09-04 - the in-person counterpart to the missing online service inventory does publish numbers: the one-stop citizen service network stands at 16 subunits with eight more committed by 2027, and recorded 1.49m visits in the first half of 2026 and Kz2.47bn paid to the treasury. They are the secretary of state's own, with no service breakdown or online equivalent published.	MOVEMENT

Digitalisation

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digitalisation of sub-national government	**ICT infrastructure for local government**	A provincial water utility begins installing 25,000-26,000 prepaid smart meters from 7 September 2026 on a stated USD 23 million budget. Benguela's provincial water utility begins installing prepaid smart meters on 7 September 2026, targeting 25,000 to 26,000 by March 2027 on a stated USD 23 million budget drawn from a USD 191.3 million rehabilitation project across five municipalities (meters). It follows a USD 15 million registration exercise that produced a 70,000-client database, replacing estimate-based billing against arrears stated above 10 billion kwanzas (meters).	MOVEMENT
Digitalisation of sub-national government	**Digitalisation of local government records**	One provincial government approved an integrated document and archive management system in December 2025, budgeting around weak internet and power. 2025-12-18 — a provincial government approved integrated document and archive management with a citizen application for proposals and public-tender tracking, implementation from January 2026, budgeting explicitly around weak internet and power. The stated six-month operationalisation target passed with nothing on file either way. It is the only sub-national digitalisation instrument on this ledger for any of the country's provinces, and no source records what the other twenty do with their records. The design assumption is the useful part: a system specified for intermittent connectivity and power is the right shape for a country where mains electricity reaches few rural households, reported under energy.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Rural digital data capture	**Digitalisation of rural health clinics**	Municipal and provincial technicians were trained on the electronic surveillance tool in April 2026, with extension to all municipalities planned. This is the clearest instance on the base of a health data system moving below the provincial capitals. During vaccination week the health ministry's public health directorate, with the world health body, trained municipal and provincial technicians on the electronic tool for vaccine-preventable disease and adverse-event surveillance, with extension to all municipalities planned. It rests on national systems that moved onto a common platform earlier in the year: the health information system integrated in April 2026 and the electronic vaccination registry. No count of clinics connected, equipped or reporting electronically is published at any level.	MOVEMENT
Rural digital data capture	**Digitalisation of rural primary schools**	As at 2019, 96 per cent of primary schools had no internet and more than 80 per cent no computers, the shortfall concentrated in rural areas. The government's own figure is the one that governs this indicator. Its consultation report for the education transformation summit records that as at 2019, 96 per cent of primary schools had no internet connection and more than 80 per cent had no computers, with the shortfall concentrated in rural areas. Nothing published since supersedes it. Against that baseline the window's school programmes are small and urban: computer laboratories under the digital schools programme, and free internet delivered to students over the national satellite. The national education database named in August 2026 has to collect from schools that mostly cannot report electronically.	NO CHANGE
Rural digital data capture	**Digitalisation of rural registry offices**	Identity-card printing reached every province by July 2026 and registration posts were rehabilitated in two provinces. Registry capacity is being pushed outward rather than concentrated. Identity-card printing was extended to all provinces by July 2026, with decentralised service reported in Cabinda, and a project rehabilitated civil registration posts in Bié and Huambo in April. Capture is moving to the point of birth as well: registration of newborns in maternity wards began in Zaire province in March 2026. The one-stop citizen service network added sub-units. What none of it establishes is that the rural offices themselves capture electronically; the base holds the service, not the system behind the counter.	MOVEMENT
Rural digital data capture	**Digitalisation of rural police stations**	An integrated public security centre was announced for Lunda-Sul in July 2026, following Cabinda's in December 2025. The provincial roll-out is the visible movement. An integrated public security centre was inaugurated in Cabinda in December 2025 and another announced for Lunda-Sul in July 2026, with the police reporting five new command and control centres. Those are provincial command facilities rather than station systems. The force's own strategic plan favours integrated information platforms, which is the stated intention; nothing on the base describes electronic record capture at a rural police station, names a case system, or counts stations connected.	MOVEMENT

Technology

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
AI	**Use of AI in government administration**	The president authorised US$6 million and a public tender for an artificial-intelligence platform for the public administration, the base's first record of money committed to one. A presidential order of 27 August 2026 authorised expenditure of six million United States dollars for the acquisition and implementation of an artificial-intelligence platform for the public administration, and opened a public tender procedure for it (order). The order authorises money and a procurement. What the platform is to do, which bodies would use it, on what data, and under what governance are not stated in the announcement, and no strategy or policy instrument on artificial intelligence in government is held to read it against.	MOVEMENT
AI	**Use of AI in sectoral management information systems**	The tax authority's machine-learning risk-analysis system began testing in 2024 with first taxpayer notices due from June 2026, built in-house. 2026-02-11 — the tax authority reported machine-learning testing begun in 2024 and first taxpayer notices due from June 2026, on a system it states it builds and feeds in-house. No baseline was published before it and the system is not in service. No model, supplier or accuracy figure is published, and no taxpayer-facing safeguard is stated beyond a right to be heard — against a draft artificial-intelligence law that would give a right to explanation and to refuse decisions made by artificial intelligence, and which has not been tabled. It is the only use of artificial intelligence inside a government sectoral system on this ledger. No health, education, justice or social-protection system reports any.	MOVEMENT
AI	**Development of national / regional AI systems**	An operator launched a web version of its AI assistant in July 2026, and no held source states any installed accelerator capacity or named AI facility. 2026-07-22 — a subscription web assistant pitched at student research launched at a trade fair, replacing a text-message version, offered by an operator reporting seven million clients across five provinces. The source confirms a prior version but does not date it, and no usage figure and no model provenance is published — so what is built locally, if anything, is not established. Underneath it there is no compute. No held source states an installed accelerator capacity, an AI cloud or a named AI facility, and the readiness assessment's own infrastructure case rests on fibre, one satellite and data centres rather than on anything AI-specific. The government data centre reported under storage is the only national compute estate on the ledger, and nothing states that any of it is allocated to this.	MOVEMENT one commercial assistant, with no installed compute behind it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
AI	**Control of AI abuse**	No supervisory authority exists: the draft law provides for a competent authority and leaves its designation, powers and seat to a future regulation. The draft artificial-intelligence law provides for a competent authority at article 61 and leaves its designation, powers and seat to a future regulation. No authority exists, and the bill has not been tabled. The same review notes that the draft repeals no existing legislation and that its financial assessment is not costed, so nothing states who would fund or staff the body it provides for. Control of abuse currently runs through instruments written for other purposes: the false-information law reported under public debate reaches platforms and application providers, and the data-protection authority reported under data protection has the only enforcement record on this ledger. Neither addresses automated decision-making, and no case involving an AI system has been recorded by either.	NO CHANGE
ICT Industry	**National capacity in DT-related production**	Information and communication was the fastest-growing activity in the fourth quarter of 2025, up 65.67 per cent, contributing 0.45 points to annual growth of 3.13 per cent. The statistics institute's quarterly national accounts give the sector's weight for the first time on this base: information and communication up 65.67 per cent year on year in the fourth quarter of 2025, ahead of accommodation and food services at 18.00 per cent and manufacturing at 16.46 per cent, and contributing 0.45 percentage points to annual growth of 3.13 per cent — the largest single-activity contribution of the year. A second official statement puts the sector up 14.3 per cent in the second quarter of 2026. Both measure the sector's output, not domestic production of equipment or software: no manufacturer, assembler or licensed equipment supplier appears on the base, and the incumbent's share offering is the only industry structure event.	MOVEMENT
Innovation ecosystem	**Technology hubs**	A science and technology park was inaugurated in June 2026 under a US$100m development-bank project, and a public-finance innovation lab launched. 2026-06-29 — a science and technology park was inaugurated under a US$100m development-bank science and technology project, intended to link academia, research, companies and young entrepreneurs. No tenant, occupancy, disbursement or operating budget is published. 2026-03-30 — a finance-ministry innovation lab launched, its first proof of concept qualified digital signatures in an internally built document system, with no budget, headcount or project pipeline published. Against them, an incubation programme agreed in March 2025 offering institutional and technical support, physical space, training and investor introductions has published no cohort, intake number, graduate or funding outcome in seventeen months. Two new buildings and no reported occupants is the shape of the evidence.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Innovation ecosystem	**Tech startup ecosystem**	A startups law passed unanimously with a revenue-ceiling definition, while the innovation ranking fell to 138th of 139 economies. 2026-03-23 — a startups law passed unanimously, defining a startup at an annual revenue ceiling of about US$3.5m with no minimum threshold, so pre-revenue ventures qualify, after passage in generality four days earlier. Promulgation and gazette number are not held. The population it addresses has not moved. Fewer than 2% of identified startups have secured venture funding, with angel and seed structures largely absent, against about 125 startups and no exit event at the last assessment, with no newer count published by anyone including the sponsoring ministry. The one visible venture is the only entrant in a fifteen-startup accelerator cohort drawn from about 2,600 applications, raising US$4.6m on AI credit scoring for motorcycle-taxi work. The innovation ranking fell to 138th of 139 economies, worse on outputs than inputs and with no cluster in the world's top innovation clusters, on a six-year trend running 132nd, 127th, 132nd, 133rd and now 138th. One startup is in court against a bank: Paga3's founders accuse Standard Bank Angola of using pilot information to build a similar product, a year on and awaiting interim relief (dispute).	MIXED a startups law passed while the innovation ranking fell to 138th of 139

Capacity

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Literacy	**Digital literacy (civil service)**	A presidential order authorised the training of local agents, framed as the step that follows investment in digital infrastructure (order). A presidential order authorised the training of local agents, framed as the step that follows investment in digital infrastructure (order). No participant target or curriculum is stated.	MOVEMENT
Literacy	**Digital literacy (general population)**	No national digital-literacy programme exists — the base carries it only as clauses inside other instruments — and the loan's grants component still has no allocation. The base carries digital literacy only as clauses inside other instruments, with no national programme, budget line, target or trained-population figure. A ministry or education programme document would settle it and none is held. The one named vehicle is a loan component: grants to non-governmental and community groups for community digital spaces and digital literacy, still with no allocation, grantee, disbursement or beneficiary count two years after it was named. The same loan carries a target of 100,000 people trained through digital literacy programmes by March 2030, and every outcome indicator under it reads zero, reported under development-partner financing. The school laboratory programme reported under training is real and is a different thing: hardware in schools, not a literacy programme for the population.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Training and skills	**DT-related training in secondary education**	School computer laboratories total more than 2,000 computers across 88 schools on the minister's own count, the latest serving 3,051 students. 2026-08-21 — a 25-computer laboratory was inaugurated at a polytechnic serving 3,051 students, bringing the programme to more than 2,000 computers installed across 88 schools nationwide on the telecommunications minister's own count. The totals are the minister's and no programme budget, connectivity provision or maintenance arrangement is published. Nothing states what is taught on the machines, whether any of the 88 schools has a connection, or who repairs them. It is the only school-level intervention on this ledger, and it is hardware. No curriculum instrument, teacher-training programme or examination in a digital subject appears anywhere for the country.	MOVEMENT
Training and skills	**DT-related university facilities and qualifications**	A satellite-technology training programme gave more than 5,600 university students free access and trained a Luanda cohort of more than 100. 2026-06-03 — more than 5,600 university students were given free satellite access and more than 100 students trained in a Luanda cohort alongside operators and manufacturers, on a curriculum covering terminal installation, integration, service pricing and billing. That is a vendor-adjacent skills programme attached to the national satellite rather than a university qualification: no degree, department, laboratory or accreditation is named, and no completion or employment figure follows the cohort. Nothing else on this ledger describes higher-education provision in a digital field. The education and research network reported under education systems is the nearest institutional item, and it has no connected institutions stated. The telecommunications institute and a cable operator signed a cooperation protocol at the seventeenth technology innovation fair: the operator will offer student internships and supply internet to the institute, including student access for academic work (protocol). It is the operator’s own press note, with no duration, intake number or value stated.	MOVEMENT
Training and skills	**Graduates entering DT ecosystem**	50 fully funded scholarships in artificial intelligence and data science opened for 2026/2027 — the first state line targeted at those skills. The window's addition is a scholarship line rather than a cohort. The national scholarship institute opened 50 fully funded external places to read a degree in artificial intelligence and data science at a national higher school in Algeria, covering fees, insurance, accommodation, transport and maintenance, for Angolan nationals aged 22 or under with a secondary average of at least 14 and at least 18 in mathematics. The domestic pipeline is measured only in aggregate: the higher education ministry's yearbook records 29,652 graduates for 2019, of whom 3,686 in science, technology, engineering and mathematics, with per-course tables including computer engineering and computer science. The sector institute held its fourth graduation in August 2025. No destination survey is published.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Research institutions	**Think tanks and academic departments contributing to DT policy**	A university chair in open science and responsible digitalisation was inaugurated in June 2026, and the largest public university joined the African engineering network. Two academic bodies with a digital remit appeared in the window, which is two more than the base previously held. Angola's first chair under the education and culture agency's programme, on open science, responsible digitalisation and social impact, was inaugurated at a private university in June 2026 with the higher-education minister presiding; its declared remit covers open data, diamond open access, open-source software and interoperable infrastructure. The largest public university was formally presented as a member of the African engineering and technology network in Dakar in October 2025, framing it as part of becoming a digital university. The Luanda science and technology park is the institutional setting both would work in.	MOVEMENT

Inclusion

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Access to services	**Citizen feedback portals**	The complaints book remains a physical book of 77 carbonless pages; the online channel sits on the public services portal under the consumer institute's mandate. The instrument is clear about what it does and does not require. The 2016 decree makes a complaints book compulsory, reaching complaints against public administration bodies and concessionaires of public services, and its article 1(2) permits suppliers and the consumer institute to publish additional online instruments while the mandatory book itself remains physical, with 77 carbonless pages. There is no national electronic complaints book; the operative online channel is the citizen's complaints book on the public services portal, run under the consumer institute's mandate from this decree. Financial services have their own route, with direct recourse to the central bank under the 2016 conduct-of-business notice. No volume of complaints made or resolved is published for either.	NO CHANGE
Access to services	**Citizen participation in policy**	Two instruments opened or closed public consultation in the window, on digital government and on data protection. 2026-05-06 — public consultation opened on a digital government bill, framed expressly around ending the dispersion of sector rules since 1997 and keeping the digital law and the data-protection law in step, against a stated administrative reorganisation running to 2027. No draft text and no tabling date is held. 2026-06-17 — consultation closed on the data protection revision, due at the Council of Ministers and then parliament. Consultation is happening and its effect is not visible: no source publishes who responded to either exercise, what was said, or what changed in a text as a result. Set against them, parliament rejected the one amendment that would have opened the citizen and electoral databases to parties and citizens, reported under data protection legislation.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Access to services	**Gender equity**	The 2013 gender policy treats access to information as a sector of special relevance and requires sex-disaggregated statistics for monitoring. The framing instrument is a decade old and directly on point. The national policy for gender equality and equity, approved by presidential decree in December 2013, treats access to information and communication as a sector of special relevance, records that women's capacity to access information remains low, and requires sex-disaggregated statistics for monitoring. Nothing in the window measures against it. The regulator's connectivity indicators are not disaggregated by sex, and neither is the bancarisation position. The one register that does collect disaggregated data is the single social register, and it publishes none of it.	NO CHANGE
Access to services	**Inclusion of persons with disabilities**	The 2016 accessibility law is in force unamended, setting general norms for people with disability or reduced mobility. The statute stands and nothing has been added to it. The 2016 accessibility law sets general norms, conditions and criteria for people with disability or reduced mobility and remains in force unamended. What the base does not hold is any digital application of it: no accessibility standard for a public website or service, no assistive technology provision, and no disability disaggregation in the connectivity or financial inclusion figures. The single social register launched in July 2026 is the system that would carry such data, and its validations are described as biometric, facial-recognition, georeferencing and documentary rather than as capturing disability status.	NO CHANGE
Access to services	**Inclusion of refugees and IDPs**	All 8,921 registered refugees held identity documents at April 2026, but government registration of new arrivals has been suspended since October 2017. The statute is generous and the register is closed. The 2015 asylum and refugee status law guarantees education, health, work, social security and justice on the terms applicable to lawfully resident foreigners, provides for a high-security refugee identity document, a permanence authorisation and a national database, and requires biometric data and a photograph from applicants. It does not confer the national identity card. The refugee agency's April 2026 position shows both halves: 8,921 individuals in 2,101 households, all granted prima facie status on entry and all registered families holding identity documents, births and deaths registered weekly — and government registration of new arrivals suspended since October 2017. 332 were voluntarily repatriated in March 2026.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital divides	**Bridging of digital divides**	Satellite programmes reached six universities and more than 300 localities without mobile operators, while the universal service fund has published no accounts, grant or disbursement. 2026-07-13 — the connectivity programme is stated at six universities and more than 300 localities where mobile operators are absent, with 20,000 students, against 27 locations and about 366,000 citizens stated to a United Nations body in November 2025. The counts are not the same measure and the base cannot net them; a separate white-space leg connected 3,972 students at two schools. Alongside it, a commercial access hub opened in December 2025 with 37 firms in the integration process by April 2026, and a first startup was licensed to resell satellite access in July 2026. The instrument built for this has done nothing on the record. The universal service fund and its 1% levy on telecom operators' gross revenue remain on statute, it may make non-repayable grants for non-commercial universal-service expansion and is barred from subsidising operating costs, and no accounts, grant or disbursement have been published for any year since 2010.	MIXED satellite connectivity reaching new places while the universal service fund has published nothing in sixteen years

Data

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
National statistics	**National strategy for development of statistics**	A statistics development strategy for 2026 to 2032 was announced as forthcoming, with a statistics-law revision to follow. 2026-06-12 — a new strategy for the 2026 to 2032 cycle was announced as forthcoming, widening the national statistical system, with a revision of the statistics law to follow. None existed before it. No source confirms that the council session, the law revision or the promised user survey took place, and no strategy document is held. What is on the record is an announcement of an approval that was to come, which is the weakest form of instrument this frame records. The statistical machinery it would govern is producing: the 2024 census and its portal are reported under censuses and surveys, and the capacity loan behind them under development-partner financing.	MOVEMENT
National statistics	**Censuses and surveys**	The 2024 census published definitive results in November 2025 and a public portal and mobile application in July 2026. 2025-11-20 — definitive results of the 2024 census were published. They are the source of most of what this report can say about the population: identity-card coverage, birth registration and household electricity access all rest on them, and each is reported under its own indicator. 2026-07-02 — a public portal carrying demographic, social, economic and housing indicators by geographic level, plus a mobile application with macroeconomic series, was launched and built by the statistics office's own staff, where census results had previously been available only as reports. Behind both, a US$60m statistical capacity loan has run since 2022 to 2027 supporting statistics-office modernisation, household surveys and dissemination, with no disbursement, restructuring or results figure on file — it financed the census machinery this report leans on, though no source links the two.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
National statistics	**Statistics from administrative data**	The higher education yearbook is compiled from seven administrative registers, and the statistics institute took peer training on administrative data in December 2025. The base holds one worked example and one capacity step. The example is the higher education ministry's yearbook, compiled from seven administrative primary registers and recording 29,652 graduates for 2019, of whom 3,777 in science, technology, engineering, arts and mathematics, with per-course tables. That is official statistics produced from registers rather than from a survey. The capacity step is the statistics institute taking peer experience on administrative data from a partner institute in December 2025, under a statistical capacity project. A statistics development strategy for 2026 to 2032 and the institute's new organic statute sit above it.	MOVEMENT
Open data	**Use of open data**	The census portal publishes indicators by geographic level, with no open-data licence, bulk download or programming interface stated. 2026-07-02 — the statistics office launched a public portal with demographic, social, economic and housing indicators by geographic level, and a mobile application carrying macroeconomic series. It is the only public data publication on this ledger. No open-data licence, bulk download or programming interface is stated, so what exists is a browsable publication rather than a reusable dataset — and no source records anybody reusing it. No open data policy, no national data portal and no dataset inventory appears anywhere for the country. The contrast worth drawing is with the registers: the population, social and electoral databases reported under registries are being consolidated at considerable expense, and parliament rejected the one amendment that would have opened any of them.	MOVEMENT a public indicator portal with nothing published about reuse
Use of satellite data	**Agricultural use of satellite data**	The national crop-monitoring platform reached a third province in August 2026, and an agricultural watch service covering Angola was agreed in September 2025. Three routes now carry earth-observation data into Angolan agriculture. The domestic one is the space programme's own platform, installed at an agricultural technical institute in Malanje in August 2026, the third province served, with one lecturer and 15 students trained as multipliers and five provincial specialists certified. The second is regional: the continental earth-observation programme and the southern African science service agreed on 1 September 2025 to strengthen agricultural monitoring through an agricultural watch service whose coverage expressly includes Angola, alongside a drought monitoring memorandum with the meteorological institute. The third is assessment work: the food agency, with the agriculture ministry and the statistics institute, used satellite-derived yield estimation across 11 municipalities in 2024.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Use of satellite data	**Meteorological use of satellite data**	The meteorological institute is contractually required to take the European satellite broadcast stream, and a regional early-warning programme adopted its implementation plans. The standing instrument is a modernisation contract with a satellite clause: the 2018 decree approving it specifies a satellite data reception system in its first annex and requires the meteorological institute to register with the European meteorological satellite organisation to receive its broadcast stream. What moved is the regional programme that feeds it. A US$4.85 million early-warning programme across 11 Central African countries including Angola had its implementation plans adopted by member states, with outputs on satellite-based severe weather forecasting using the satellite organisation's nowcasting facility and hydrological monitoring using satellite altimetry and soil-moisture products; the regional situation room became operational in Douala in September 2024, and in February 2026 national services and regional centres agreed collaboration mechanisms. A drought platform memorandum runs beside it.	MOVEMENT

Geopolitics

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
US / hyperscaler activities	**USA / hyperscaler MoUs, engagements and commitments**	A wholesale partnership combined the state cable company's systems with a US network, while a US$170m agreement stands undelivered. 2026-05-21 — a partnership agreement combines the state cable company's three subsea systems with a US network of more than 300 metro markets and 386,000 km of fibre, reported again the following week. No value, term or capacity commitment is stated. Against it, an announced US$170m agreement with a US$25m first phase for a national cybersecurity agency, vendor academy training and an undersea cable has no disbursement, contract or delivery on record in the fourteen months since it was announced at a business summit, and no trainee count, cohort or curriculum has been published against its training commitment. Nothing links its agency phase to the cyber centre created by decree six months later. A domestic subsea cable to link the coastal cities and connect a transport corridor to international systems is stated as under way, and the base names no US instrument, agency or financing behind its digital leg.	MIXED a wholesale partnership signed while a US$170m agreement produced nothing in fourteen months
China activities	**Chinese MoUs, engagements and commitments**	A digital-health memorandum was signed in January 2026 covering 38,000 health workers and 500,000 remote consultations, and a research centre was pledged by 2027. 2026-01-26 — a four-year memorandum with a Chinese vendor covers training of about 38,000 health workers, more than 500,000 remote consultations, hospital digitisation, telemedicine and health artificial intelligence. No value, milestones or domestic financing are stated, and it was signed for the health ministry by an acting department director rather than the minister. No delivery has been reported. 2025-10-06 — a research and development centre was announced after a presidential audience, targeted by 2027, with location under evaluation and investment value undefined, paired with a pledge to train 7,000 people in artificial intelligence and emerging technologies by 2027, as reported from the audience itself. Nothing has been recorded in the ten months since. The substantive Chinese engagement on this ledger is not a memorandum at all: it is the concessional loan behind the national broadband network, reported under the fibre backbone, which has no progress report on file at either end.	MOVEMENT on memoranda, with no delivery reported against either

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
EU activities	**EU MoUs, engagements and commitments**	A French-financed earth-observation satellite passed a system milestone in May 2026 and is under construction, on about EUR 225m secured in January 2025. 2026-05-14 — a system key-point milestone was validated on the earth-observation satellite, which entered construction after a March 2026 kick-off with first ground infrastructure delivered from June 2026 and a design of more than 1,000 high-resolution images a day. Financing of about EUR 225m was signed with France in January 2025, with no build started at that point. No launch date is published, and no source states what the imagery is for: no agricultural, meteorological, cadastral or disaster-response programme on this ledger names it as a source. It is the largest single European commitment on the ledger and the only one with construction behind it.	MOVEMENT
Gulf/UAE activities	**Gulf MoUs, engagements and commitments**	A Gulf digital memorandum in force since 2021 has produced no deliverable report, valuation or successor since 2023. The memorandum has been in force since December 2021, its agreed heads a three-year digitalisation master plan, public-private-partnership and build-operate-transfer financing, and youth digital skills. The telecommunications ministry attributed the national cloud implementation project to it in February 2023. Nothing has been published since. No deliverable report, valuation or successor instrument exists on the record, the memorandum text itself is not published, and the ministry's account and the vendor's are the only sources for any of it. The national cloud it was credited with is now in operation, reported under data storage, and no source connects the delivered system back to this memorandum.	NO CHANGE
India activities	**India MoUs, engagements and commitments**	An Indian credit line announced in May 2025 carries US$200m for defence, with digital public infrastructure a separate pledge carrying no money. The joint statement of the May 2025 state visit records a US$200m defence credit line, with digital public infrastructure, space technology and capacity building as a separate pledge carrying no money. Secondary reporting framed the digital component as part of the credit line, and the base corrected its own framing in favour of the primary. No contract, vendor or engagement has been recorded since, confirmed at a reconcile pass in July 2026. The digital identity platform now out to tender, reported under digital identity, names no Indian involvement.	NO CHANGE

Where the record is thin

SYSTEM OR INSTRUMENT	WHAT WOULD SETTLE IT	LAST PROBED
Critical national infrastructure designation	enactment of the cybersecurity law, or a standalone decree, would settle it; probed 2026-08-05, the December 2025 presidential decree vests the designation power in a new cybersecurity centre but publishes no designation list, and the cybersecurity bill was approved in detail in committee on 2026-08-07 with a final vote set for 2026-08-13	2026-08-05
Cybersecurity fund	a constitutive decree would settle it; probed 2026-08-05, no constitutive decree exists; the fund appears only as a named destination for 30% of the cybersecurity centre's revenue	2026-08-05
Count of public services available online	a published service catalogue or a completion report would settle it; probed 2026-08-05, the government's own eServices catalogue names seven services but is undated and the portal root is in maintenance	2026-08-05
Installed AI compute capacity	the readiness assessment's infrastructure case rests on fibre, one satellite and data centres; probed 2026-08-05, no document states installed capacity; the nearest published measures are regional aggregates in a July 2026 IMF paper	2026-08-05

SYSTEM OR INSTRUMENT	WHAT WOULD SETTLE IT	LAST PROBED
Digital inclusion grants component	a procurement or disbursement report would settle it; probed 2026-08-05, the World Bank implementation status report gives component costs and disbursement; the governing programme manual was still to be drafted	2026-08-05
National digital-literacy programme	a ministry or education programme document would settle it; probed 2026-08-05, no standalone programme document exists; the national digital skills strategy is recorded as still to be developed	2026-08-05
Private credit information centres	an APD or central-bank licensing instrument, or a named operating centre with a start date, would settle it; not probed	not yet probed
