NIGERIA · RWANDA · SIERRA LEONE · SOMALIA · SOUTH AFRICA · TANZANIA · UGANDA · ZIMBABWE

The place reports do not share one window; the period above is the range they span.

Algeria

The National Digital Services Centre was inaugurated by President Tebboune on 5 July: [two active-active sites at Mohammadia and Blida](#), built by Huawei to Uptime Tier III design, with 99.98% availability claimed by the operator. On 12 July administrations were ordered to interconnect to it [within one month](#). The national sovereign cloud is hosted there; no service catalogue and no tenant list is held, which is why its position is recorded without a baseline rather than as an advance.

Angola

The commercial data centre is [operating at up to 3 MW and more than 800 racks over 19,000 square metres on US\\$30m, near the cable landings, with a plan to exceed 7 MW within five years](#). Its group contracted six times as much power in the first half of 2026 as a year earlier — a group figure, not an Angolan one.

Botswana

The Kala data centre [completed its first full quarter of continuous operation to 30 June, with revenue the company itself describes as modest and at proof-of-concept scale](#). It is designed for up to 1 MW and expansion is subject to funding. The base holds nothing on the facility before September 2025.

Burkina Faso

A wholly domestic commercial hosting provider [launched on 31 July](#) with more than 600 domain names, more than 196 web hostings and 98% availability at launch — the vendor's own figures, with capacity, tier and certification unstated.

Cameroon

The state operator spent the month selling capacity it has already built. It [showed the Zamengoe data centre to a second prospective tenant on 13 August](#), presenting hosting, storage and security services and the facility's Tier III certification, eight months after the central bank toured the same site with a view to hosting. The base holds no signed hosting contract from either visit.

Central African Republic

On 16 July the minister met the counterparty's operations vice-president, moving the [incumbent operator's privatisation into an operational phase](#). [US\\$150m is announced across network modernisation, a data centre and connectivity](#); the deal structure is undisclosed, and definitive takeover agreements, a joint steering committee and a deployment schedule are all still to be established. [It is the fourth attempted rescue of this operator, the prior one agreed in November 2020, needing EUR 20m and never funded.](#)

Congo

The published roadmap names [sovereign hosting and connectivity at the two highest tiers](#) among its infrastructure programmes; neither exists, with no standing-up instrument, host body, budget or date.

The national data centre remains a thing asserted rather than reported. On 10 August the state operator [showed the minister a real-time security operations centre running across its Brazzaville, Pointe-Noire and Oyo data centres](#), alongside nationwide fibre connectivity for citizens, businesses and state bodies. It is the fullest description of the operator's estate the base holds, and it is still a ministerial visit rather than an inauguration report: no capacity, certification or utilisation figure is given for any of the three sites, and nothing reconciles it with the [works reported suspended at 95% completion in late 2025](#).

Cote d'Ivoire

The national data centre was [formally authorised at US\\$170m of United States export-credit financing, its scope now a sovereign data centre, a government digitisation platform and a smart-border surveillance system](#) — up from the US\$66m approved in August 2025, with no site, capacity or completion date stated. The operating commercial facility at Grand-Bassam is unchanged at a design capacity of about 400 racks and 1.5 MW, while its [group committed capital rose to US\\$380m and contracted power across a six-country footprint ran six times higher in the first half of 2026 than a year earlier](#) — group figures, not Ivorian ones.

Djibouti

On 19 July 2026 the state signed a memorandum of understanding with the Shanghai-based LinkWise Group, [stated at US\\$1.35bn and carried in full by the investor with no state equity and no sovereign debt](#), for a 100 MW AI compute centre, a digital industrial park and international data corridors, valid one year. In [an interview published on 23 July](#) the minister-delegate for investment gave the terms: 1,000 hectares of land, guaranteed seawater abstraction for cooling, a policy-stability clause presented as a legal guarantee of long-term investor return, a tax-exemption period before revenue accrues to the state, technical training in place of local employment quotas, and cryptographic compute in the revenue model alongside AI. The preparatory phase runs six months from signature; nothing is disbursed and no site is held. The 100 MW figure is the promoters' own.

DR Congo

On 29 July the digital economy minister named a [sovereign government cloud among the ministry's projects to be ordered and made executable](#), alongside the digital and data strategies, the identity platform and a certification authority. No hosting location, operator, procurement or budget line was stated.

A data-centre group lifted [committed capital from US\\$350m to US\\$380m](#) across six markets, none of it allocated to DR Congo in the source.

Egypt

A market report puts an East Cairo campus at [25 MW operating with plans for 45](#) and names an Egyptian expansion inside a continental pipeline of 890 MW, with no site, capacity, investment figure or date. The report itself is not held.

Huawei [has bid to build the government's AI data centres](#), proposing to export 1,408 Ascend 950-series chips for a training cloud and a further 600 for two inference clusters on a twelve-month build, while the US State Department assembles a rival consortium of Nvidia, AMD and Microsoft. It would be the first confirmed export of Huawei's Ascend accelerators; no award is on file, and the reporting rests on unnamed sources and documents the correspondent reviewed.

Equatorial Guinea

The government [formally pressed the supplier to deliver the equipment still outstanding under the 2020 contract to digitise the state broadcaster's technical infrastructure](#). Six years after signature the contract is being chased rather than closed, and no delivery schedule, contract value or penalty is on file.

Ethiopia

Ethiopia is [named among the markets diversifying Africa's data-centre estate](#) alongside Nigeria, Kenya, Egypt, Ghana and Morocco, against South Africa's 60%-plus share of operational capacity. No Ethiopian site, capacity or investment figure accompanies the naming.

Gabon

The Nkok facility was inaugurated on 3 July 2026 with 92 racks over 3,000 square metres, 1 MW installed and a cost of XAF 8bn, peered to the ACE and SAT-3/WACS submarine systems ([figures given at the inauguration](#)). The operator stated at the same event that [about 95 per cent of data produced in Gabon was hosted outside the country](#).

On 31 July the minister inspected the second Tier III facility, a neutral carrier hotel built by the state company ACE Gabon SA at 160 racks and over 1 MW, interconnected to the submarine systems, and confirmed commissioning between end-November and early December 2026; he described it as a public structure financed by the local banking sector ([site inspection](#)). No cost figure was given.

Gambia

President Barrow [inaugurated the National Data Centre at Abuko on 1 July 2026](#) alongside the identity system it hosts — the second data centre in ten weeks, and the first in state hands. No capacity, tier rating, operating cost or operator is stated, and the [account carried by the identity industry press](#) adds none of them. Nothing published bears on the backbone or on satellite licensing.

Ghana

The country's largest data-centre campus by committed capacity entered the record on 28 July at [30 MW designed for expansion to 150 MW](#), through a regional trade round-up with no Ghanaian primary behind it. [The same 29 July announcement reaffirmed the US\\$250m AI compute centre approved in April](#). Sixteen weeks after Cabinet approval, the compute centre has no site, contractor or procurement notice.

Kenya

On 4 August the operator building the 44MW Tatu City data centre [moved completion to July 2027](#) from a first-quarter 2027 date.

Two prospective builds at the technopolis went from talk to signature inside five days. On 13 August the authority and a hyperscaler were [exploring a local cloud outpost and a startup and technical centre of excellence](#) and the ICT principal secretary [received a Chinese network communications group on broadband, smart cities and digital infrastructure investment](#); by 18 August the authority had [signed a collaboration agreement putting the hyperscaler's technical leadership behind an Outpost for hybrid cloud and a startup and innovation centre of excellence](#), with certification courses for its staff and for young Kenyans and credits for startups, and [a memorandum with the Chinese group covering the planning, investment, financing, design, development and maintenance of cloud, artificial intelligence, high-performance computing and smart-city infrastructure on the site](#). Neither instrument carries a capacity, a site, an investment figure or a date, and the second states its financing models as still to be explored.

A proposal arrived that would sit outside the grid entirely. A foreign firm [has proposed a US\\$1.5bn offshore data centre at Mombasa, powered by liquefied natural gas and designed to bypass the national grid, and is reported in talks with the government](#). No capacity, timeline or site is disclosed, and the value and the design intent are the proposing company's own.

Lesotho

The Kobong Project was approved and launched on 31 July 2026 at a ceremony hosted by the US Embassy in Maseru, attended by the ministers of energy and mining, of information and communications, and of environment and forestry. [Convallt Energy's chief executive stated capital investment of about US\\$6.2 billion](#); the government figure for the project was restated as M100 billion against the M98 billion [announced with the binding agreement of 4 June](#), with the dollar figure unchanged. The US Chargé d'Affaires described the investment as trade over aid. Construction remains targeted for 2029 and the agreement remains conditional on feasibility, financing, permitting and definitive agreements.

Separately, and with no stated relationship to Kobong, the state began drafting a data-centre policy of its own. A [five-day, six-ministry workshop ran in Maseru from 17 to 21 August toward a draft data-centre implementation roadmap](#), coordinated by the UN Office for Digital and Emerging Technologies with the Resident Coordinator's Office and joined by UNESCO, the ITU, UNICEF, the OECD, the World Bank Group and UNDP. It covers data governance, skills, compute, energy, cooling, financing and implementation choices, and builds on the artificial-intelligence, data-management and broadband policies the government validated in draft in January 2025. The workshop [opened on 17 August with the deputy prime minister's keynote, drafting a National AI Strategy alongside the blueprint](#).

Liberia

At the same 21 July event the minister also [announced a national data centre to hold government data domestically](#), with no completion date, budget line or site given.

Malawi

On 3 July the e-government department agreed integration of immigration e-services onto the national exchange platform ([e-government department](#)).

The revenue authority's own resilience improved on donor money. Its [World Bank-funded secondary data centre and uninterruptible power supply upgrades are reported as improving service continuity, cutting queues and improving customs-duty accuracy at border posts and the international airport](#), under a six-year, US\$150m regional trade and connectivity project running to 2027. The specific financing commitment date is not stated in the record held, and no capacity, location or availability figure is given for the facility.

Mauritania

The national government cloud is close enough to service to be shown off. On 11 August a visiting development-bank vice-president [was briefed at the national data centre on data-security testing and migration preparation ahead of go-live](#). No go-live date, migration scope or capacity figure is stated.

Mauritius

At the regional summit on 17 August the prime minister announced [a carrier-neutral green data centre and a "Digital Embassy Village"](#) as the digital leg of a bid to position the country as a regional hub and gateway. No site, capacity, cost, operator or date is stated, which is what separates it from the two data centres already running.

Morocco

The ministry signed a memorandum of understanding with a data-centre power and cooling supplier in Rabat on 27 July, covering digital infrastructure, cloud, artificial intelligence, high-performance computing and data centres. The ministry's own text commits only to exchanged expertise, technical studies and the identification of structuring projects, and attaches no sum; the 50 MW sovereign data centre in Rabat is named as something the cooperation will feed ([ministry communique](#)). Parallel talks were held the same day with two other suppliers on the same ground.

The Dakhla campus acquired a shape without acquiring a date. It is [planned as a green data-centre campus under the Igoudar Numerique programme, one part for the kingdom's sovereign digital needs and another open to private investment, with feasibility studies launched in April 2026](#). No capacity, cost, operator or commissioning date is held for it, and the same account gives no national facility count that would place it in an estate.

The compute platform behind that estate acquired a price. A press account citing third-party analysis [puts the Casablanca project at roughly US\\$1.2bn and up to 500MW, naming a South Korean cloud operator, a chip maker and the platform's developer, with a second renewable-powered project planned for Dakhla](#). Neither figure comes from a filing, and the question the same account raises is whether hosting foreign-operated infrastructure builds anything domestic beyond the hosting.

Mozambique

The country's first university-operated data centre was inaugurated on 3 August with about 14 times the storage of the server room it replaces, precision cooling and redundant systems ([inauguration account](#)). It is World Bank financed with no amount, operation name or project number stated.

A carrier-neutral operator announced on 23 July that a wholesale network will co-locate in its Mozambican and Angolan facilities, with no deployment date, capacity or value stated ([partnership announcement](#)).

It was formally inaugurated eight days later, on 11 August, [sited at the university in recognition of its running of the country-code domain and the internet exchange, and intended to carry artificial-intelligence, cloud and research services](#). No capacity, cost or service date accompanies the intention.

Namibia

A vendor is building smart-city solutions and a data centre with the ICT and home affairs ministries, and [China committed CNY 98,000,000, given as about US\\$14.4m](#). No signed agreement, annexure or contractor list is held, and an [opposition member puts the same commitment at N\\$245m](#) with no dated conversion between the two.

Nigeria

A Lagos cloud region [entered service on 10 August](#), the third on its operator's platform alongside Lisbon and Johannesburg and presented around data residency since the Nigeria Data Protection Act took effect — three legal jurisdictions carried on one platform. It joins [about 26 facilities carrying 50 to 56 MW live](#), a figure that [reaches some 124 MW only when operators' design specifications are counted rather than declared capacity](#), Africa's second-largest market after South Africa at about 15% of continental capacity, most of it in Lagos.

The state put its own instrument behind the same argument on 5 August, [signing the regulatory framework for a National Sovereign Cloud Initiative with the state-owned Galaxy Backbone](#), setting policy, technical and quality requirements for hosting government and business services in the country. It excludes nobody: the stated ask of Google, Microsoft and Amazon is a clearer path to local deployment. The dependence it is aimed at is [more than 85% of national workloads running on public clouds, and 22% of the thousand most-visited sites hosted in Nigeria against a sub-Saharan average of 34%](#).

The sovereign cloud acquired its instruments and a start date. Four were signed on 4 August — [a cloud computing guideline, a cloud technical guideline, a digital infrastructure assurance framework and a cloud investment strategy](#) — with certification of cloud and artificial-intelligence infrastructure providers to begin in October, oversight vested in [a new governance committee and a stated ambition to serve West and Central Africa](#). What certification will require of a provider is not published.

The month's largest capacity announcement is offshore-financed and not yet sited. The operator group [named the UAE backer of its Africa Data Hub Holding vehicle on 27 August as Tarek Al Ashram, founder of the Dubai colocation operator Gulf Data Hub, with its own connectivity business a shareholder supplying open-access connectivity and go-to-market support](#), the vehicle having been named in the group's half-year results booklet three days earlier without the partner behind it. The [first phase targets 150MW of AI-ready capacity across South Africa and Nigeria](#), with no split between the two countries, no Nigerian site, no cost and no commissioning date stated — a number to hold against the 50 to 56 MW the country's twenty-six existing facilities actually carry.

Rwanda

The data centre and cloud service directives governing the national facility are unchanged, and their [own text carries no date on its face](#) — [the ministry's sector plan is what dates them to 2023](#). No compliance or enforcement record is published.

Sierra Leone

The same 7 August account states the biometric register runs on a Tier III data centre, as reported by the NCRA Director-General ([consultation account](#)).

Somalia

The national data centre went backwards in the telling. A facility described at a ministerial inspection in May 2025 as nearing completion was, on 7 August 2026, [described by the state minister for communications as planned](#), to strengthen digital infrastructure — said at the launch of an artificial-intelligence product by a private centre. Nothing in the record reconciles the two accounts, and the ministry's stated rationale, ending reliance on data storage outside the country, remains its own statement that government data sits offshore.

South Africa

The commercial estate is expanding on the operator's own numbers rather than on a published plan. An international operator is [scaling its Johannesburg facility to 24MW and holds a ZAR7.5bn South African expansion budget covering that site plus banked land in Johannesburg and Cape Town](#), with further build-out held pending demand. No grid connection, water use or municipal approval detail is stated — and a civil-society coalition used the same week to call for deceleration, transparency and public participation in data-centre expansion, which is the argument the absent detail is about.

The expansion also drew its first organised objection. A civil-society coalition [submitted concerns to the human rights commission on 10 August calling for a halt on data-centre developments pending transparent public participation, citing strain on scarce water, land and electricity](#). No participation process, commission response or moratorium is on record, which is what makes the objection the only thing here that can be dated.

Two compute announcements closed the month, both making sovereignty the argument and both resting on the announcer's own figures. Three partners [launched what they describe as Africa's most powerful AI cloud, a 7.2 EFLOPS deployment on more than 50 NVIDIA B300 HGX servers carrying over 400 GPUs in carrier-neutral Tier-3+ colocation, pitched as keeping African training and inference workloads, and the data behind them, resident on the continent](#); no independent benchmark, customer, price or site accompanies the number. Separately the mobile operator group [named the UAE backer of its Africa Data Hub Holding vehicle as Tarek Al Ashram, founder of the Dubai colocation operator Gulf Data Hub](#), three days after its own half-year results booklet named the vehicle without the partner behind it, [with a first phase targeting 150MW across South Africa and Nigeria](#) and no split, site, cost or commissioning date stated. Against those, the one deployment in the country with an externally verified figure is the Cape Town artificial-intelligence factory, which [entered the June 2026 global supercomputer list at rank 36 on 285,696 cores and 77.79 PFlop/s measured against a 102.16 PFlop/s theoretical peak](#).

Tanzania

A data-centre group named its Tanzanian site as under development while raising [committed capital from US\\$350m to US\\$380m](#), giving no Tanzanian size, cost or date.

A sector review of 5 August put a count on what is already there: [ten data centres in Dar es Salaam and one in Dodoma, operated by six carriers](#). It is a count and nothing more — no capacity, load or utilisation accompanies it — and it is a trade magazine's rather than the regulator's, so it does not replace the state's own count of public centres commissioned.

Uganda

The Namanve colocation facility is operating with no Uganda capacity figure published; its group [committed capital rose from US\\$350m to US\\$380m on 13 July](#), a figure spanning seven markets rather than Uganda alone.

Zimbabwe

The ICT ministry's 29 July address named a national high-performance computing centre, the state fixed operator and a private operator's data centre — the listed infrastructure company's Harare technology park among them — as the infrastructural spine for future government artificial intelligence ([launch account](#)).

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
