

MONTHLY UPDATE

Use of satellite data: monthly update, July 2026

Edition of 2026-08-24-2 · compiled from the Data Landscapers source base

13 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.

The place reports do not share one window; the period above is the range they span.

Angola

The regulator [licensed a first private reseller of national satellite capacity on 2 July](#), following [37 firms entering the commercial process by April](#).

Congo

The national mapping institute began putting its own holdings into a usable form. On 11 August it [signed a framework partnership with a local non-governmental organisation to digitise, secure and disseminate its geospatial and cartographic data](#), building a shared platform for public, institutional and research access. It is a framework agreement rather than a delivered platform: no term, funding, licence or access rule is stated, and nothing says what is currently held or in what form.

Egypt

A [trilateral memorandum with Japan's land and agriculture ministries](#) covers joint research and the application of artificial intelligence to monitoring water structures and flood risk, with Egypt intending to use a Japanese satellite rainfall product across Nile basin states. No money, date or named system is stated, and the instrumentation targets are old physical structures, the barrages first.

Ghana

Two satellite-derived systems were [named as live deployments at a university lecture reported on 10 August](#): an agricultural information and monitoring system, and a national forest monitoring system paired with a deforestation tracker built toward European deforestation-regulation compliance for cocoa and gold supply chains. Both are named by their builder, and no coverage, accuracy, user or funding figure is published for either.

Liberia

The Land Authority took the country's geospatial ambition abroad rather than to a budget. At the United Nations' sixteenth global geospatial information management session in August it [sought international partnerships and technical support to build a National Spatial Data Infrastructure](#) — a coordinated geospatial framework for land administration, mapping and national planning. It is an approach for support rather than a programme: no funding, custodian, standard or timetable is stated, and the base still holds no earth-observation or geospatial data programme of any kind.

Libya

On 4 August the Libyan Authority for Scientific Research [discussed launching a first Libyan satellite for climate and desertification monitoring](#), at design stage with no budget, timetable, launch partner or procurement route stated.

Mozambique

A development-bank and Korean-financed programme has left a standing national flood-mapping capability: [nine LiDAR-equipped drone systems, simulators, unmanned surface vessels and data platforms, with 30 specialists from the meteorology institute, the disaster management institute, the cartography and remote-sensing centre, the roads administration and the water directorate certified in July](#). The cohort was deployed half-trained into the January 2026 Marracuene floods, which the district recorded with no loss of life. The account is the financing bank's own, and it states no running cost, custodian institution or arrangement for sharing the mapping output.

Namibia

China [handed over a satellite data-receiving ground station at the earth station outside Windhoek, Namibia's first, receiving remote-sensing data and operated by fourteen trained Namibians](#). The handover date is inferred from a weekday named in a report published the next day, and no operating agreement, data-sharing term or ownership arrangement is held.

Niger

The national geographic institute [runs a remote-sensing unit producing Sentinel-based imagery for forest, land-use and territorial monitoring, and describes itself as an exclusive satellite-imagery distributor in several countries](#). No programme name, partner or date is published, and the page carries no date of its own, so the position is dated to retrieval rather than to any event.

Rwanda

A [national satellite data programme launched with a commercial imagery provider on 10 August](#), giving government agencies, public universities, selected startups and development partners access to near-daily imagery for agriculture and food-security monitoring, forest health, urban planning and disaster response, managed by the space agency. It was announced jointly by vendor and government, and no cost, term, data-licence arrangement, contract or appropriation is held.

Seychelles

Cabinet approved accession to the UN Committee on the Peaceful Uses of Outer Space and engagement with UNOOSA on 22 July 2026, framed as building geospatial-data capability for maritime security, disaster preparedness and ocean management; no accession process or programme detail has followed.

Sierra Leone

DSTI announced on 4 August that it is [developing a national base map with the Ministry of Lands, with JICA support and Japanese technical direction, phase one covering Western Area Urban District](#). No cost, timetable, hosting arrangement or data licence is stated.

Zambia

A Zambian platform [pairs satellite imagery with artificial intelligence for smallholder traceability and market matching](#), built after commercial traceability software was quoted at thousands of dollars a month. The account is the founders' own, with no user count, revenue or independent verification held.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
