

MONTHLY UPDATE

Sectoral management information systems (HMIS, EMIS, etc.): monthly update, August 2026

Edition of 2026-09-01-2 · compiled by Claude Opus from the documents in the Corpus repository

38 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.

ALGERIA · ANGOLA · BENIN · BOTSWANA · BURUNDI · CAMEROON · CENTRAL AFRICAN REPUBLIC · COMOROS · CONGO · COTE D'IVOIRE · DR CONGO · EGYPT · ETHIOPIA · GABON · GHANA · GUINEA · KENYA · LESOTHO · LIBERIA · LIBYA · MADAGASCAR · MALAWI · MAURITIUS · MOROCCO · NAMIBIA · NIGERIA · SAO TOME AND PRINCIPE · SENEGAL · SEYCHELLES · SOMALIA · SOUTH AFRICA · SOUTH SUDAN · SUDAN · TANZANIA · TOGO · TUNISIA · ZAMBIA · ZIMBABWE

Algeria

Two internal systems moved in different registers. The tax administration [published its first user guide for electronic payment on its platform, setting out seventeen rejection reasons](#) — a document describing the failure modes of a live system, which is more than most such platforms disclose. And the interior and transport ministry [signalled activation of tachograph monitoring of professional transport](#), with no start date, fleet scope or data-handling rule stated.

Angola

The education ministry and a domestic technology firm [expanded their work on the integrity of the national education database](#) under a five-year, thirty-country data challenge, with the ministry's planning office as counterpart; [the initiative was launched in Luanda from 5 to 7 August](#). No data-quality baseline, scope or completion date is published, and no contract or programme document is held.

Benin

The tax directorate's information-system modernisation surfaced in the window only because its funder republished the project sheet. The EUR 2m project [runs from 9 August 2023 to 31 December 2026](#), which puts it four months from its stated end. What the sheet does not carry is any statement of what has been delivered — no module, no milestone, no completion status — so the base can date the project and price it, and cannot say whether it is finishing or merely ending.

Botswana

The health ministry [signed a ten-year strategic partnership with a foreign health-systems operator](#). The announcement is the counterparty's; no contract value, list of systems, data-handling terms or governance arrangement is published, so a ten-year commitment sits on the ledger with nothing describing what it obliges either side to do.

Burundi

The one new management system in the window sits outside the state's own stack. A [digital tool for tracking the institutional performance of Burundi's technical and vocational training centres in real time was validated on 7 August](#), built by CREOP-Jeunes under the EU-backed Umwuga Akazi project. No deployment date, centre count or custodian ministry is stated, so what the tool will be attached to is not yet on the record.

Cameroon

Health and education information systems both gained instruments and neither reports a deliverable. A [EUR 8m technical-assistance agreement over 36 months covers the education management information system, the basic-education ministry's mapping platform, interconnection of the education databases and dynamic dashboards](#); the funder is not stated and the signature date is not published. The [national digital health strategic plan launched on 4 March with an envelope of about FCFA 29bn across eight axes including governance, legal framework and health-information-system interoperability](#), and a [pandemic preparedness project was launched](#) with no deliverable reported. Collection moved where the plans did not: the health ministry [took delivery of nearly 1,000 smartphones on 7 August to run the SCANFORM data-collection system in place of paper forms](#), across ten regions, 175 health districts and 395 facilities, with over 1,500 health workers to be trained. The counts are the ministry's own and no go-live date is given.

Central African Republic

Health information in the window is a single link run by someone other than the state. A remote hospital [is using telemedicine to reach a global network of healthcare professionals](#), the service run by an international medical organisation rather than the health ministry. One site is a capability and not yet a system: no case volume, connectivity arrangement or continuity plan is published, so what happens to the link when the organisation leaves is not on record.

Comoros

The base holds one movement on school records this window, and it is private rather than ministerial. Cschool, a school-management platform built to centralise pupil enrolment, report cards, examinations, financial tracking, parent communication and online payment of fees, [was launched at Comor'Lab on 25 August](#); no adoption decision, procurement route or school count is stated, and the hosting association's call for the education ministry to require interoperability with existing systems drew no answer on adoption.

Congo

Health acquired equipment rather than a system. On 7 August the Global Fund and UNDP [handed over e-health equipment, a P2-level biosafety laboratory and a secure biomedical-waste management system at the Edith Lucie Bongo Ondimba hospital at Oyo](#), for early disease detection, patient data management and health-service coordination. It is a single site; no value, system name, national rollout or interoperability with any other health system is stated, and it sits beside a civil-service payroll platform whose own operator has minuted three failure modes. That platform gained a fourth problem in public: the public service minister [told the Senate on 7 August of fraudulent duplicate payroll numbers and of deceased or retired staff still drawing salaries](#). No count, value or remedy is stated, and the disclosure is the minister's own.

Cote d'Ivoire

Work began on digitising the national school map, education-sector stakeholders convening at Yamoussoukro on 19 August 2026 to [build geographic information systems onto the integrated education management information system](#). No coverage, timetable or delivery date is on file.

DR Congo

Enforcement caught up with the standardised electronic invoice. The finance minister [closed the fiscal clinics and ordered immediate targeted sanctions against non-compliant taxpayers and against tax-administration staff](#).

Naming the administration's own staff alongside the taxpayers is the part worth recording; no compliance rate, sanction count or invoice volume is published.

Egypt

The social insurance authority reported on 3 August that it had served 8,621,000 people in about four months and cleared 92% of its arrears backlog — while the 95 online services it undertook in February within six months remained forthcoming as that window fell due ([authority account](#)).

Ethiopia

A [livestock information system went live on 29 July](#), drawing on five priority databases and repositioning animal identification from an export tool to a national asset register — broadened from feedlots to farm level and linked to disease surveillance and vaccination records. The account is the implementer's own, written after four years with a team embedded in the ministry, and is uncorroborated here. A system that has been running far longer got its evaluation: a journal study published on 10 August [puts a community HIV case-management application in the hands of 950 health workers, with the time to reach case data down from a month to a day and data completeness near 100%. Ninety-two per cent of mobile accounts and 94% of web accounts were actively used](#). The figures are the study's and cover deployment since 2017; no national coverage figure or cost is given.

A technology group and a bank [signed an agreement to digitise the agricultural supply chain](#); no scope, value, farmer count or launch date is stated.

Gabon

On 30 July the education ministry received 1,000 tablets for what the minister described as 148 connected schools ([handover](#)).

The state's civil-service human-resources record has been failing for months. The Fichier unique de reference is [near-inoperative, blocking tenure confirmations, reclassifications, recruitments and promotions and stopping their pay effects reaching agents, the breakdown sitting in the data-replication link between the civil service and pay services](#); on 25 August the vice-president of the government ordered an emergency plan restoring career management, agent mobility and data replication. The civil service ministry says it is migrating to an integrated state human-resources management system.

Ghana

One sectoral system was assessed rather than built. A Danish-funded gap assessment of the meteorological agency [reported gaps across its ICT infrastructure, digital systems, data governance and cybersecurity framework](#), presented to the communications ministry in Accra under a bilateral weather and climate cooperation. Neither the assessment text nor any cost, timetable or funding line for the roadmap it recommends is published, so what the month holds is a diagnosis and no commitment to act on it.

Guinea

Health information systems here are being built by private operators rather than by the ministry. A Guinean academy's [Visa Medical hospital-digitisation model](#) is deployed in 19 Guinean hospitals with more than a million users on a self-financed basis, and is being extended to Chad, the Democratic Republic of the Congo and Morocco. Separately, a Guinea-based physician's platform [coordinates blood donation and blood-bank logistics across West Africa](#), founded in 2022 to stop units expiring at one facility while another is short. Both are private; the figures are their own, and neither account states a ministry relationship, a patient-data protection arrangement or any interoperability with the national health information system, which remains In development.

Kenya

Health claims authorisation failed at the counter through the month. A teachers' union raised on 30 July that members were [turned away and billed in cash](#) when the platform failed, one charged Ksh8,500 on 19 July; the Authority answered that the Digital Health Agency runs the system on its behalf. The platform's cost re-entered the record in August: the President denied on 18 August that the state entered a KSh 104bn technology contract, and was reported on 21 August putting [the KSh 104 billion at the total project service fee over ten years rather than a lump-sum government payment](#). The Auditor-General's finding of a KSh 104.9bn procurement, unbudgeted and non-competitive, is not answered by that; no contract text is held.

An academic review published on 5 August put the child-protection case system on the other side of that ledger, [crediting it with cutting duplication and improving real-time coordination between agencies, with recorded cases rising from 20,235 in 2016/17 to 54,583 in 2021/22](#). The most recent of those figures is four years old, and the system is American-funded — which places it in the same account as the withdrawal recorded under inclusion below.

Lesotho

The national commission [advertised a consultancy to strengthen its capacity to coordinate national monitoring and evaluation reporting](#). A tender for the capacity to coordinate reporting is itself a statement that the reporting is not coordinated; no scope, budget or deliverable date is published.

Liberia

The month's clearest finding about a government system is that it does not exist. The General Auditing Commission found that a [digital lending platform built for the World Bank and IFAD-backed STAR-P project was still undelivered, with US\\$36,768 paid in full to a savings and loans institution for a system contractually due live by May 2025 and not deployed at the auditor's May 2026 field verification](#). The same Management Letter, issued on 29 June 2026 for the audit period to 31 October 2025, found no functional project audit committee, a US\$27,000 consultancy let without competitive procurement, and an agriculture commercialisation fund's reporting dashboard never formally handed over to the ministry. The platform is now recorded as *Not held* with a dated search behind it.

Libya

The state importer of Libya's medicines opened its first digital supply system. On 17 August the Medical Supply Organisation [launched the pilot phase of a Sustainable Medical Supply Platform](#), developed with and implemented by NSR International for Information Technology, a subsidiary of the Libyan Foreign Investment Company, to manage pharmaceutical procurement, inventory and distribution toward a unified national medical-supply database. No cost, pilot scope or timetable is stated, and what the platform's artificial-intelligence component does is not described.

Madagascar

An assessment put Madagascar's [digital-health maturity at 55.6 per cent](#). Neither the assessment instrument nor who administered it is named in the account.

Malawi

Two internal systems are close to the point where they carry real work. The automated human resource and payroll management platform [is in pilot ahead of government-wide rollout](#), and the Labour Market Information System [reached the final stage before launch after a technical workshop in mid-August](#). Neither carries a go-live date, a coverage figure or a data-source list.

Mauritius

Two sector information systems sit at opposite ends of the same problem this window. A validation workshop [endorsed a proposal for a national Fisheries Information System, for submission under a multilateral fisheries fund's project-implementation grant window](#) — a system that does not exist yet and has no award behind it. Meanwhile the health estate shows what happens after a system is built: patients discharged from a national centre [were reported still looking for their medical records](#), against a one-patient-one-record ambition. The base holds no delivery figure for either.

Morocco

The same 50-article digital health bill adopted in the government council on 22 July 2026 creates a shared medical record and a national health identifier under a new digitisation agency ([bill account](#)).

Namibia

The Roads Authority [commissioned a N\\$13 million project control system](#) to strengthen oversight of road projects. No project count, user base or reporting output accompanies it.

Nigeria

Federal [HR and payroll](#) moved to a locally built platform across more than 508 ministries and more than 600,000 civil servants, justified explicitly as data sovereignty.

The federal payroll is to be audited from the outside. The President [directed the finance minister on 28 August to coordinate a forensic audit of the integrated personnel and payroll information system and related payroll, pension and financial-management platforms - reconciling ghost-worker figures, tracing how ineligible persons were enrolled, reviewing access, identity, biometric and bank-account controls, and examining the interfaces with the financial management system and the Treasury Single Account](#), alongside a definitive inventory of every federal agency and its legal basis.

Sao Tome and Principe

AFAP extended the deadline of tender ref. 45-G on 7 August 2026 for supply, installation, training and commissioning of a new management-information system for EMAE, the state water and electricity utility. The original terms, contract value and new deadline are not stated in the source held — a scanned procurement notice with no text layer, so only the notice's own headline could be read for this pass.

Senegal

The higher-education, research and innovation ministry reported a further step in the digital transformation of its services, framed around interoperability; no service list, user count or completion date is given.

Seychelles

Firstpost reported on 8 August 2026 that bilateral consultations between India and Seychelles on adopting the e-Sanjeevani, e-Office and e-Hospital platforms were advancing, with no MoU, pilot or date yet established.

Somalia

Health information gained a project and a set of funders. The health minister launched a Pandemic Fund project in Mogadishu to strengthen prevention, preparedness, detection and response for infectious disease and public health emergencies, with multilateral and regional partners named alongside it. What is not published is the part that would make it a system: no budget, no duration, and no specification of the surveillance and reporting infrastructure the project is meant to build.

South Africa

The student funding scheme's administrator submitted a stabilisation plan stating that ICT is the scheme's biggest operational risk, fragmented, manual and not fit for purpose. The same submission reports 66 major audit findings and a disclaimer audit opinion from the Auditor-General, 115 overdue internal audit findings and nine material irregularities, five of them data or systems defects. The scheme was placed under administration in May and its governance failures referred to the Special Investigating Unit.

A revenue system went back to market. The home affairs department re-advertised its revenue administration system over 275 fixed sites and 230 mobile units, replacing a generic 400-plus site listing and making point-of-sale devices and mobile offices the primary transaction channels, with only suppliers on the state IT agency's RFB 1183 transversal contract eligible to bid. It is a tender, not an award: no value, closing date, bidder or delivery schedule is held.

South Sudan

On 5 August the education ministry launched an Education in Emergencies Management Information System on the DHIS2 platform with UNESCO and the HISP Centre, funded by Education Cannot Wait, after training 35 master trainers; twelve County Education Departments have been equipped with solar power, computers and connectivity to feed it.

Sudan

The Civil Service Diwan launched Bayan, an integrated national HR database for every public employee's record, on 6 August 2026, described as integrable with digital ID, e-signature, PKI, the Kafa'a recruitment platform and the finance ministry's Wafi payroll platform. No coverage, cost or data-protection arrangement was disclosed for a national HR database stood up during an active war.

Tanzania

At the same exhibition the agency described a farmer-records and permits system and a fertiliser monitoring system, with no user counts, spend or timeline given.

The state's own asset record is being enforced rather than built. The finance ministry is tightening enforcement of the central electronic system for recording and monitoring public assets, citing a hydropower project at about TSh6tn and a railway at about TSh10.6tn, with legal backing through amendments to the Public Finance Act and the Public Assets Management Regulations 2024. No count of assets recorded, entities complying or value reconciled is published, so the two named investments are cited as scale rather than as entries in the system.

Togo

Togo put a national platform online centralising climate-risk data for public decision-making across agriculture, forestry, water resources, tourism and energy. Indicators on droughts and floods are entered by field agents, checked by sector focal points and regional officials before national consolidation, time-stamped to leave an audit trail, and viewable at regional, prefecture and municipal level; it was developed by the environment ministry with technical support from a UN agency and climate-fund financing, and follows the regional adaptation plans adopted by all five regions in 2025. The source gives no launch date.

The modules for a National Malaria Data Repository were approved, following a training-of-trainers workshop held at the public-health training and research centre. No go-live date, facility coverage or data flow is stated.

Tunisia

The health estate reported volume and the education estate reported failure. 120,000 remote examinations were carried out across 26 hospitals, with no period, denominator or specialty breakdown stated. The education ministry's school-life platform, launched at the start of the month, was within three weeks reported failing during the enrolment period, with no service-availability figure, incident account or fallback route published.

Zambia

An emergency outbreak response platform entered two days of user-acceptance testing. User-acceptance testing is the last stage before a system becomes someone's responsibility in an emergency; no go-live date, participating facilities or data flow is published.

Zimbabwe

The national electronic medical record reached 1,254 of a planned 1,900 health facilities, on a health financing partner's account rather than the ministry's. The platform's own front page describes it as the national health operating system, spanning care-finding, provider verification, medicines and diagnostics directories, virtual care, an assistant and public health notices — run largely without a citizen account and gated by a separate professional-

authority check — and carries no facility-coverage figure and no last-updated date of its own. An operator separately reports [more than 20 telehealth centres established](#), company-reported to an anniversary feature with no patient, consultation or availability figure.

On land the state consolidated rather than built: the lands minister said on 24 August that [three land databases had been merged into one integrated digital system reached through a One Stop Title Processing Centre, with 27,045 plots surveyed and 10,231 mapped to beneficiaries and 1,824 agreements of sale worth about US\\$110 million concluded](#). The figures are the implementation committee's own and nothing on this ledger tests them.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
