

MONTHLY UPDATE

Rural digital data capture: monthly update, August 2026

Edition of 2026-09-02-2 · compiled by Claude Opus from the documents in the Corpus repository

14 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.

BURUNDI · CHAD · COMOROS · ESWATINI · GUINEA · LESOTHO · MALAWI · MALI · MAURITIUS · NIGERIA ·
SIERRA LEONE · TOGO · ZAMBIA · ZIMBABWE

The place reports do not share one window; the period above is the range they span.

Burundi

Civil registration is the one rural system with a number attached to it. Marking African Civil Registration Day, the territorial administration directorate [set out digitalisation of civil status in pilot communes and decentralisation down to zone level, with planned interoperability with health facilities for births and deaths notified through hill chiefs, and a UN agency stated that thirteen communes already hold a biometric registration system](#). Thirteen is the whole of the count: against well over a hundred communes, what the base records is a pilot that has been running for at least a quarter and a national position that has not moved.

Chad

[Solar-powered telemedicine kiosks](#) are helping rural patients overcome distance to care. No kiosk count, operator, consultation volume or funding source is on file.

Comoros

The civil-status modernisation project took its design into the countryside, [consulting midwives, village chiefs, cadis and mayors at Fomboni on Mwali about registration difficulties on 28 August and continuing into the rural districts of Djando and Nioumachoi](#), with still-unregistered rural residents named as the problem to solve. Consultation is not digitisation: no rural registry office is recorded as converted, and no office count exists on file.

Eswatini

Rural data collection got hardware rather than a system. The agriculture ministry [handed 40 tablets and 4 laptops, valued at E313,504, to agricultural extension officers on 10 August](#) under an IFAD and Green Climate Fund-backed project, for real-time crop, livestock and weather reporting by officers working with smallholder farmers across all four regions. No officer total, data platform, reporting standard or custodian for the collected field data is stated, so what the reports feed into is not on the record.

Guinea

The first rural digital service to reach farmers this month was a private one carried on a state bank's counters. An agritech firm and the state rural bank [launched a first cohort at Conakry on 6 August pairing field sensors, weather alerts and agronomic advice with the bank's network of over 1,000 service points](#). No cohort size, cost or coverage is stated, and the base still holds no state rural digital-services programme to set beside it.

Lesotho

Two movements reached rural service points from opposite directions. Thirty [SMS-based birth registration stations were established in government and church health facilities across Maseru, Berea and Leribe on 5 August](#), putting the capture point in the clinic rather than the registry office and on a text message rather than a terminal. Days earlier the universal service fund [opened procurement for Wi-Fi and network equipment at police stations across all ten districts](#).

Malawi

The university [ran two days of computer-skills training for 75 police officers](#) on 13 August. It follows the budget statement's [requirement that police fees be paid cashlessly from 1 April 2026](#), and neither reaches a station: the crime management system is still at pilot, and no station count or deployment outside headquarters is on file.

Mali

The same week [recommended an updated universal-access strategy with a white-zone map, against a 2030 universal connectivity target](#). No map, coverage baseline or funding line accompanies the recommendation.

Mauritius

The [virtual reality programme in primary schools](#) is the second digital programme now running in the primary estate, after the [education platform launched in January](#) under the operator pilot. Neither publishes a school count or a pupil reach. On an island of this size the rural indicators are answered by national programmes rather than by a rural one, and what the base cannot say of either programme is how much of the estate it has reached.

Nigeria

The communications minister told the President on 4 August that [deployment of about 3,700 towers begins around October](#), reaching more than 20 million people in communities with no telecoms service and with the capital stated as raised — no funding source, operator or contract is named. The baseline against which it is measured is [23% of rural communities connected to 57% urban](#).

Sierra Leone

The agriculture ministry is [finalising an upgraded interactive voice response platform, reported 98% complete, to give farmers direct access to ministry officials](#) under the national food-security agenda. Voice is the right channel for the users it names, and the account states no launch date, language coverage, call volume or cost — [98% complete](#) being the ministry's own description of a system nobody outside it has used.

Togo

Togo's agricultural digital work is now being copied. Chad [drew on the Togolese experience of deploying agricultural digital solutions](#). The account is the host government's own. What the record held does not carry is a measure of what those solutions have achieved in Togo, which is what would make the visit worth making.

Zambia

One rural school was connected. An operator [connected a primary school's computer laboratory in the Chipapa community by satellite](#), a completed deployment rather than a commitment. Set against the education ministry's own target for schools connected to reliable internet by the end of this year, it is one school with four months to run, and no progress count against that target is published.

Zimbabwe

The ICT minister told the National Assembly on 17 July that the universal services fund currently covers satellite-kit subscriptions only for digital centres and schools, and only for one year ([National Assembly account](#)).

Schools are where the terminals have gone. The education minister told the Senate that [11,500 satellite terminals have been distributed to schools — 8,000 to those with no wireless network and 3,500 to those already connected — with more than 1,300 institutions still to reach and a target of internet connectivity, solar power and national-grid access at every school by December 2026](#), alongside a cabinet commitment of 3% of GDP to research and innovation. The counts and the target are the minister's own; no school total, verification of installed and working terminals, or recurrent connectivity cost is stated — and the same fund that bought them pays a subscription for one year only.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
