PROGRESS REPORT

Central African Republic: progress report, October 2025 – October 2026

Edition of 2026-10-12 · compiled by Claude Opus from the documents in the Corpus repository

GOVERNANCE · FINANCE · ICT INFRASTRUCTURE · DPI · DIGITALISATION · TECHNOLOGY · CAPACITY · INCLUSION · DATA · GEOPOLITICS · WHERE THE RECORD IS THIN

This report asks the same set of questions of every country. The rows below are a fixed frame of indicators, one row each, chosen in advance and covering all thirty-eight subjects the repository tracks — so what appears here is decided by the frame and not by whichever records happened to accumulate. Each row says what happened on that indicator during the period, with every claim linked to the source it rests on.

Where a row reads *No evidence*, the repository holds nothing on that indicator. **That is a statement about this repository, not about the country** — it does not mean nothing exists, only that nothing has been collected here yet. The rows that carry evidence say what it is; the rows that do not are left to speak for themselves.

The period is 2025-10-01 to 2026-10-12.

Progress values. *Movement* — some form of progress, however minor, has been recorded. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the repository holds a standing position and nothing in the period touched it. *No evidence* — the repository holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Movement, regulations still pending*.

Governance

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	**Digital transformation strategy**	The 2024-2028 national development plan remains the frame for the digital agenda, cited at a ministry platform launch in February 2026. The national development plan has been the governing framework since 2024 and is cited as the frame for the ministry platform launched in February 2026, reported again in March. It did not move in the window. There is no separate digital strategy on this ledger: the plan carries the agenda, and the round-table mobilisation total the ministry states for it appears in a source that reads as a rewritten press release and is not independently corroborated. The one sector plan that exists is for public finances, reported under data governance, and its costed operational version is still unpublished. The national digital plan never got past its studies. Drafting of Centrafrique Digitale 2025 was commissioned in 2018, its studies were presented in November 2021, and the financier's completion report records them as validated; no adopting act is held. A digital development agency was created by law in June 2023 to implement the national strategy, and a call for a firm to draft a costed government digitalisation roadmap closed in January 2025.	NO CHANGE
Strategies, plans and policies	**ICT strategy**	No standalone strategy. Digital sits inside the national development plan for 2024 to 2028 and the investment programme beside it. The Central African Republic governs its digital agenda through general planning instruments rather than a sector strategy. The national development plan for 2024 to 2028 is the framework, with the investment programme launched in September 2025 as the financing envelope. One sectoral strategy is on the repository and it is narrow and old: a government-wide cloud strategy recorded as planned in a financier's status report of December 2023. Nothing since records it adopted. The ministry's 2026 orientations are the most recent statement of direction and are not a strategy document.	NO CHANGE
Strategies, plans and policies	**Broadband strategy**	An investment programme states a target of 3,000 km of fibre-optic deployment; no broadband plan is held. 2025-09-04 - a US$12.8bn investment programme tied to the national development plan states an explicit national target of 3,000 km of fibre-optic deployment. It is a target inside an investment programme, not a broadband strategy: no coverage objective, no timetable, no financing close and no kilometre built under it is recorded. It sits against a standing twelve-thousand-kilometre fibre commitment this ledger already carries, which is four times larger and equally unbuilt.	NO CHANGE a first stated position with no earlier account behind it
Strategies, plans and policies	**Data storage / cloud strategy**	A government-wide cloud strategy is recorded as not developed against a yes target for December 2026. A development bank supervision report records the indicator for a government-wide cloud strategy developed and disseminated as not met at baseline, current and actual value, against a target of yes by 31 December 2026. Nothing later records it being drafted, and the project that carries the indicator reported 78% activity completion and 54% disbursement with six months to run - so the target date and the project's own closing date are now close together with no strategy on the record.	NO CHANGE a first stated position with no earlier account behind it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	**Data interoperability framework / roadmap**	A government platform launched in February 2026 is at pilot stage; the digital governance project reached 78 per cent progress. There is no published interoperability framework, and there is now a platform. A government interoperability and data platform was launched in February 2026 and is at pilot stage, its use in the planning ministry described separately. It sits inside the public sector digital governance project, which reported 78 per cent progress in August 2026 and whose procurement plan of February 2026 sets out what remains to be bought. The cloud strategy that would sit above it is still planned, and no roadmap with dates has been published.	MOVEMENT
Strategies, plans and policies	**AI strategy**	The minister stated in November 2024 that an artificial-intelligence strategy for 2024 to 2028 was in elaboration; nothing has appeared since. 2024-11-21 - the digital economy minister stated that the country was in full elaboration of a national artificial-intelligence strategy for 2024 to 2028. Twenty-one months on, no draft, adoption instrument or text has appeared, and the strategy's own stated period is more than half elapsed. No regulation of artificial intelligence is held either. What the country does hold on artificial intelligence is outside government: a translation system for the national language built independently and a machine-learning price-imputation platform run by a development bank.	NO CHANGE a first stated position with no earlier account behind it
Strategies, plans and policies	**Data localisation policies**	No localisation rule. Transfers out are governed by the 2024 personal data protection law, whose supervising authority is still only planned. No instrument requires data to be held in the country. The transfer question is answered by statute: the 2024 personal data protection law carries a cross-border transfer regime, resting on the constitutional right to privacy. The authority that would administer it does not yet exist, and the hosting it would govern has nowhere domestic to sit: the tier-three data centre is planned rather than built and the cloud strategy is planned. A localisation rule would at present have no facility to point at.	NO CHANGE
Strategies, plans and policies	**Data governance policy**	The public finances digitalisation plan names a data governance policy among six systems and a data centre; no text, date or status for it is held. The 2025-2027 plan was presented naming an electronic tax platform, a treasury system, procurement and payroll systems, a Tier IV data centre and a data governance policy, none of them priced. The costed operational plan is still unpublished and the named data governance policy is the only such instrument on file, with no text, date or status. 2026-07-02 — a public finance review estimates that digitising the tax administration could raise up to two points of national output in additional revenue in the short term, and recommends electronic public procurement and a digital cadastre over the longer term, against domestic revenue of about FCFA 187bn or 10.1% of output in a 2025 budget of about FCFA 385bn. It is the first independent assessment of the plan's subject matter the repository holds. So the fiscal case for digitisation is now made by an outside institution, and the policy the state named to govern the data it would collect does not exist as a document.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	**Open data policy**	The statistics institute modernised its open data portal against the international readiness index in June 2026. No open data policy sits above it. Publication is happening without a policy. The statistics institute modernised its open government data portal, working to the international open data readiness index, in June 2026, which is the repository's only operating release channel. It rests on statistical rather than open-government authority: the statistics law and its replacement went to a validation workshop in April 2026, and the institute works to international statistical standards under a quality framework diagnostic. No open data policy, licence or release duty for other ministries is held.	MOVEMENT
Legislation and regulation	**Data protection legislation**	The data protection law has been in force since January 2024 with no implementing decree, and none appeared in the window. The law was promulgated in January 2024 as a comprehensive regime with no supervisory authority and no implementing decree, and that remains the position. The held text is a scan with a poor character layer, so its wording is legible and individual characters are not reliable. No decree, amendment or first application is recorded in the twelve months to 2026-08-26. The authority the law creates is reported below and does not exist either, so a comprehensive statute has been in force for nineteen months with neither the rules nor the body needed to apply it.	NO CHANGE
Legislation and regulation	**Cybersecurity legislation**	The cybersecurity and cybercrime law has been in force since early 2024 carrying six to ten year sentences, and is named as the instrument now used against online content. The law was voted by acclamation in January 2024 and has been in force since, carrying six to ten year sentences and fines of FCFA 5m to 10m. Its text is unchanged and the statute itself is not held, which is a standing acquisition target. 2026-07-29 — a commentator names it as the instrument now used against online content. That is an opinion column rather than a record of prosecutions, so what the repository can state is the claim and not a case. The agency the same law creates has never been established, reported under cybersecurity readiness, so the enforcement side of the statute runs through the ordinary criminal process.	NO CHANGE
Legislation and regulation	**Legislation covering digital id**	Government terms of reference scope legal reform covering civil status with digital identification; no such law is held. The terms of reference cover personal data, cybersecurity, electronic communications and civil status with digital identification. Two of the instruments they scope were made in early 2024 - the data protection law and the cybersecurity law - and nothing records the identification leg being drafted. What exists instead is an obligation without a statute behind it on the record: the unique identification number is recorded as made mandatory in a budget-support completion report, with no instrument named.	NO CHANGE a first stated position with no earlier account behind it
Legislation and regulation	**Digital payments legislation**	Payments are legislated regionally. Domestically the 2022 electronic transactions law is the only instrument reaching electronic dealing. No national payments statute appears on this repository. The domestic instrument that touches electronic dealing is the electronic transactions law, alongside the cybersecurity and cybercrime law of 2024. The rules that actually govern payment come from the region: the interoperable code-payment standard adopted in July 2026 and the regional financial inclusion strategy. What operates domestically operates under those: mobile payment of the import declaration fee and electricity bills paid over mobile.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Legislation and regulation	**Legislation enabling data interoperability**	A national platform became operationally effective at one ministry in February 2026; no interoperability statute is held. 2026-02 - a national platform became operationally effective at the planning ministry, with data migrated, staff use made mandatory and a launch ceremony held, launched publicly in late February. It is the first working government data platform the repository holds. The architecture it would sit in is commissioned rather than built: the digital governance project's procurement plan carries a US$300,000 technical-assistance contract for interoperability architecture. No statute, decree or standard obliging interoperability appears anywhere on this ledger, so what enables exchange here is a platform and a contract, not a law.	MOVEMENT
Legislation and regulation	**AI legislation / regulations**	No instrument names artificial intelligence. A strategy is being drafted and the broadcasting regulator has asked for tighter identification against deepfakes. Nothing enacted here reaches artificial intelligence. The national policy or strategy is in development and no draft text is held. The nearest regulatory action is a request rather than a rule: the broadcasting regulator asked for tighter identification in response to deepfakes and artificial-intelligence disinformation in June 2026. What law exists is general — the cybersecurity and cybercrime law and the 2024 data protection law, the latter without an authority to enforce it.	NO CHANGE
Legislation and regulation	**E-commerce legislation**	Loi 22.002 of January 2022 is the operative electronic transactions law and the only instrument on the subject the repository holds. The law adopted on 11 January 2022 governs electronic transactions and is the single instrument on the subject the repository carries; the regulator's own law index carries the citation. The law's own held record has no resolvable address - the regulator's hosted file did not answer from two clients - so what a reader can follow is the index entry rather than the text. No implementing decree, no dispute under it and no electronic-commerce measure is held, and nothing in the window touched it.	NO CHANGE a first stated position with no earlier account behind it
Legislation and regulation	**Statistics legislation**	The 2001 statistics law is still the basis, and a modernised replacement was validated in April 2026. 2026-10-10 — the institute reported the draft through technical validation and strategic review and awaiting the commission on draft official texts. The founding law of 16 July 2001 established the national statistical system, the statistics institute and the national statistics council, and is still the institute's own cited legal basis. 2026-04-23 - a workshop with the presidency, the national assembly, ministries, the central bank and civil society validated a modernised draft law to replace it, carrying new institutional arrangements. No adoption or promulgation is recorded since, so a twenty-five-year-old statute still governs.	MOVEMENT
Legislation and regulation	**Access to information legislation**	No access to information statute is held. The 2023 constitution carries a privacy right; legal reform for digital transformation remains at terms of reference. Nothing on this repository is an access to information law. The constitutional layer addresses the opposite side of the question, protecting privacy, and the reform that might supply one has not started: terms of reference for a legal framework for digital transformation, dated March 2023. Where information does reach the public it reaches it by publication rather than by right: the statistics institute's open data portal and the unified public services portal. Neither creates a request procedure or an appeal route.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data protection	**Data protection authority**	The data protection authority is eighteen months past its statutory establishment deadline, its functions vesting in the supervising ministry meanwhile. A twelve-month statutory deadline for establishing the authority expired in January 2025 with no establishment recorded, and the statute vests its functions in the supervising ministry in the meantime. The law that creates it was promulgated in January 2024. Eighteen months past the deadline, nothing has moved. The sanction ceiling the unfilled body would wield is 5% of the last closed year's pre-tax turnover, so the gap between the regime on paper and the regime in operation is the whole of the enforcement. Data protection supervision therefore sits with the ministry that also sponsors the identity, payments and platform programmes reported in this document.	NO CHANGE
Data protection	**National data protection readiness**	A critical account reported the president turning to mobile operators to trace citizens through SIM card records (report). A critical account reported the president turning to mobile operators to trace citizens through SIM card records (report). No official instrument authorising it is held, and no data-protection safeguard is named in the account.	REGRESSED
Regional collaboration	**Regional policy collaboration**	The minister met a development-bank delegation on joining the six-country regional digital integration programme; no financing agreement, amount or date is recorded. 2026-03-06 — talks were reported on joining the six-country regional programme covering broadband, cross-border interconnection, secure public platforms and digital skills, with no figure, signature or follow-up since. The source is a secondary aggregator with quotes attributed to a wire service and the meeting date is not stated, so participation is reported intent rather than finance. Nothing has followed in five months. The programme is the obvious route to the cross-border interconnection and the secure platform layer the country lacks, and it is the only accession discussion on this ledger. The central bank adopted a regional financial inclusion strategy for 2025-2029 covering the six member states, validated by the monetary union's ministerial committee on 21 December 2023 and published in February 2025 (strategy); the repository holds no member-state implementation plan, target or outturn under it.	MOVEMENT
Regional collaboration	**Regional legal harmonisation**	A police circular applies community free movement on biometric documents at every border post, admitting community citizens for up to 90 days. A police circular of September 2024 applies the community free-movement rules at every border post, admitting community citizens for stays of up to 90 days on a valid biometric national identity card, community identity card, biometric passport or approved community passport, implementing an additional act of April 2019 on common migration policy. A neighbouring state issued equivalent instructions the same month. Nothing in the window changed it. It is the only instance on this ledger of a regional legal instrument being applied domestically by an operational order, and it depends on documents whose issuance is reported under digital identity as priced informally at one prefecture.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Regional collaboration	**Shared regional infrastructure**	A community interoperable payment-code standard launched in July 2026 across the six member states, and a regional data-centre programme names a facility here. 2026-07-30 — the regional central bank and the payments body launched an interoperable payment-code standard binding across the six member states, routed and settled through the regional switch and secured to card-industry standards. No country-specific adoption step is on file, and the country's share of regional payment volume was 0.43% in 2024. 2026-08-25 — a regional programme at definition stage, 25% progress, plans six new data centres across the community including one here, alongside reinforcement of five existing centres, at a stated total of US$9.00m across eleven countries. The prospectus states a programme total rather than a country allocation. Both are cases of the region supplying what the country has not built: there is no national data centre, reported under storage, and no domestic payments standard on this ledger.	MOVEMENT
Regional collaboration	**Cross-border data transfers**	The data protection law's chapter III sets an adequacy-based cross-border transfer regime; no decision under it is held. The law of 25 January 2024 sets scope, principles and rights, and its chapter III sets the operative cross-border transfer regime on an adequacy basis. No adequacy decision, transfer authorisation, standard clause or enforcement action under it appears anywhere on this ledger, and the authority that would make one is separately on the repository without a recorded decision. The regime therefore exists in law and has produced nothing that can be checked.	NO CHANGE a first stated position with no earlier account behind it
Standards	**National interoperability standards**	No published standard. A government platform is at pilot stage and customs transit interoperability is being built to a regional standard. Interoperability here is being built project by project rather than to a published national standard. The government interoperability and data platform launched in February 2026 is at pilot stage, inside a digital governance project at 78 per cent progress. The one exchange working to an external standard is customs: transit interoperability between the regional system and the customs platform. Statistics work to international standards under a quality diagnostic. No enterprise architecture, data dictionary or identifier convention is published.	MOVEMENT
Standards	**National quality standards**	A spectrum-monitoring system was delivered in June 2025 and a quality-of-service package remains under contract, with a publication site financed and not live. A spectrum contract signed in October 2024 completed in June 2025, and a quality-of-service package signed the same month carries no completion date, unchanged at the February 2026 revision of the procurement plan. The plan's actual-amount column is unpopulated throughout, so no contract value is published. 2026-02-02 — the minister stated the regulator had obtained financing for a website publishing operators' quality-of-service data. No site was recorded live on a third test in July 2026. If delivered it would add a measure of service quality to the regulator's market counts.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Standards	**Adoption of international standards**	A diagnostic against 19 international statistical quality principles was finalised in May 2026. The clearest earlier instance is the enhanced general data dissemination standard implemented through a national summary data page. 2026-03-24 - a workshop validated a national data management, processing and dissemination policy governing quality standards and sharing mechanisms. 2026-05-15 - a restricted workshop finalised a diagnostic against 19 international statistical quality principles, feeding a future national quality assurance framework. All three are statistical; no technical, security or interoperability standard adoption appears on this ledger.	MOVEMENT
Public debate and participation in policymaking	**Non-governmental contribution to national policy**	Non-state bodies supply what the state does not: a fact-check on payment fraud and a national AI grouping. What the repository holds under this heading is a pattern rather than a policy contribution. A community fact-checking network debunked a mobile-money phishing scam where no regulator statement exists. A national representative introduced an artificial-intelligence pioneers grouping at the continent's main machine-learning gathering where no national strategy has appeared. And an incubator describes itself as the country's first. None is recorded as consulted on, cited in or responded to by any government instrument.	NO CHANGE a first stated position with no earlier account behind it
Public debate and participation in policymaking	**Open discussion of government policy**	The communications council asked for tighter subscriber identification and for platform account closures, acknowledging that its own competence covers media professionals. 2026-06-12 — at a press conference the communications council's president requested better control of subscriber identification to limit anonymous accounts, activation of international judicial cooperation against content produced abroad, and cooperation with international platforms on reporting and closing accounts. No instrument was adopted, and the council acknowledged that its own competence covers media professionals rather than the general public. Nothing else on this ledger touches online expression except the cybersecurity statute reported under legislation, which a commentator names as the instrument now used against online content. So the requests describe an intention to reach beyond an existing mandate, and the law that would already reach there is in force. 2026-09 — a presidential decree created a communication-monitoring cell under the government spokesperson, one of its three units dedicated to monitoring national and international media and social networks and countering rumours. It is an instrument of government messaging, and the decree as reported sets no safeguard on how monitoring is used.	NO CHANGE requests to restrict anonymity made and no instrument adopted

Finance

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Domestic budget appropriations and expenditure	**Sustainable domestic financing of digital transformation**	Two private-invoice lines carry FCFA 1,000,000,000 and FCFA 500,000,000 for 2026, while the digital agency's transfer includes FCFA 118,000,000 for six months of unpaid salaries. The largest digital lines are unexplained. Two named private-invoice lines carry FCFA 1,000,000,000 and FCFA 500,000,000 for 2026, the second having no predecessor in 2024 or 2025; the estimates state no purpose for either payment in any year, and together they are 21 times the digital ministry's entire investment title. The digital development agency's transfer is split into FCFA 300,000,000 for urban optical loops and FCFA 118,000,000 to clear six months of unpaid 2024 salaries, an eightfold rise in two years of which a quarter is arrears on its own staff's pay. The state also budgets FCFA 250,000,000 of telephone arrears to its own incumbent for a third year, while negotiating that operator's privatisation. Elsewhere the money is real and small: FCFA 420,000,000 for customs system deployment, the largest digital line outside the digital ministry, and FCFA 1,600,000,000 transferred to the regulator against its own draft budget of FCFA 6,200,000,000. All of it sits inside a 2026 budget carrying a FCFA 28bn deficit with public investment down 2.06%. The enacted 2026 law was posted on 29 December 2025 as an image-only scan; no enacted appropriation or outturn is extractable for any year.	MIXED the digital vote's largest lines are unexplained private-invoice transfers while the agency delivering it is budgeting arrears on its own staff's pay
Financial sustainability	**Financial sustainability of digital systems**		NO EVIDENCE
MoUs and other agreements	**Strategic relationships**	Three digital financial services accords were signed in November 2025, while a data-centre memorandum signed in January 2025 never advanced to contract. 2025-11-10 — three accords were signed: an institutional one with the finance ministry aligned to a development institution's 2030 strategy and the national plan, one with a commercial bank on its participation in digital services, and one with the incumbent mobile operator on building the capacity of its distributor network. No commitment sum is stated for any of the three. Against them, a data-centre memorandum signed in January 2025 has never advanced to contract, and at July 2026 there was still no contract, site or financing. It is one of five live proposals circling the same unbuilt national data centre, and a twelve-month absence of movement is the finding. The pattern is consistent across this ledger: agreements are signed at ceremonies, and the ones that convert are the ones with an implementing partner already in country. 2026-09-29 - the national internet and security unit signed a memorandum with a data-infrastructure and AI company for a national data centre, a security operations centre, a response team and a digital twin of the mining subsoil; no cost, financing, site or timetable is published.	MIXED three financial-sector accords signed while a data-centre memorandum stood dormant for a year
New investments	**Mobilisation of non-state finance**	A financier signed three digital financial services accords with two banks and an operator in November 2025; the incumbent's recapitalisation is being negotiated at US$150 million. Two routes to non-state money are open and neither has closed. The first is intermediated: a development finance institution signed three digital financial services accords with an operator and two banks in November 2025. The second is equity: the incumbent operator's privatisation and recapitalisation is reported at US$150 million. Against them stands a warning about how such deals go here: a data-centre memorandum signed in January 2025 is recorded as dormant. The regional digital integration programme accession is the public alternative and is planned.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
New investments	**Development-partner project financing**	The public sector digital governance project reported 54% disbursed and 78% of activities complete in August 2026, four months before its December closing date. A US$35m grant approved in May 2022 and closing December 2026, plus US$6.4m of additional financing appraised in May 2025, had disbursed US$11.35m or 33% at April 2025. 2026-02-23 — the procurement plan was revised, recording two regulator packages as signed and one completed, with no later disbursement figure held. The funder's own record of procurement performance is candidly poor: planned dates not respected, weak document quality and evaluation committees not held on time. 2026-08-19 — its strategic committee put the project at 78% of activities complete and 54% disbursed with six months to run, the committee's own figures and the first disbursement reading since April 2025. Everything it has delivered that the repository can name — the spectrum system, the regulator packages — sits inside the regulator, and the exchange layer, data centre and identity system the country lacks are not among them. 2026-09-15 — the regional digital programme's national component is to launch in April 2027, after a financier mission in Bangui on connectivity, public services, data and cybersecurity. No national allocation or workplan is published.	MOVEMENT

ICT Infrastructure

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	**Mobile penetration**	A third operator launched fourth-generation service in the capital, while subscribers at a northern town had no calls, no internet and no mobile money for close to a month. 2026-05-14 — the third operator launched fourth-generation service in the capital, completing commercial service at all three, having been licensed in December 2025 against one operator live since May 2025. A licence is not coverage: fourth-generation population coverage was measured at 0.3% in 2023. 2026-07-28 — subscribers at a northern town reported no calls, no internet and no mobile money for close to a month, with no restoration date, and some officials unpaid for the previous month because salary transfers run over mobile services. Single-operator dependency with no redundancy, attributed to off-grid relay sites, equipment theft and repair crews travelling hundreds of kilometres. The instrument that would fix that is dormant: the country's first passive-infrastructure licence for pylons, antennas and technical sites to be built and leased to the operators was signed in July 2025 fourteen days before the window opened, and no tower count, site build or lease has been recorded since.	MIXED all three operators now hold fourth-generation licences while one town lost every service for a month

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	**Internet usage**	The regulator counts 1.56 million internet clients at end-June 2026, more than 23% of the population, against a publisher's user estimate of 12.0% at October 2025. 2025-11-08 — an end-2025 measurement puts users at about 670,000, 12.0%, at October 2025, with 2.49m mobile subscriptions and 38.1% penetration at end-2025, against an earlier international estimate of 13.8% for 2024 and a publisher estimate of 15.5% in January 2025. The publisher reports fewer users against a larger population, so the earlier figure is withdrawn rather than showing a decline. 2026-09-16 - the regulator's first-half 2026 market observatory, compiled from operators' statutory returns, counts 1.56 million internet clients, 99.65% of them on mobile, up about 23% in a year and more than 23% of the population. It counts subscriptions rather than people, so it does not compare with the user estimates, but it is the first figure the repository holds from a national measurer.	MOVEMENT on the regulator's own client count
Connectivity	**Mobile affordability**	Satellite service costs about 136% of monthly income per head, at FCFA 33,000 a month plus tax with a kit at FCFA 240,000, against a 2% international threshold. 2026-03-16 — commercial service opened at FCFA 33,000 a month plus tax with a standard kit at FCFA 240,000, a monthly price of about 136% of monthly income per head against an international affordability threshold of 2%. The object advanced and affordability did not, and the state's response was to suspend non-homologated kits rather than to address price. That is the only published price of any kind on this ledger. No mobile tariff, data basket, handset price or regulator price schedule appears for the country at any date, so a service costing more than a month's income per head is the country's one affordability datapoint.	NO CHANGE
Connectivity	**National fibre backbone**	The backbone holds 935 km in service and gained nothing through the window, against a 12,000 km commitment stated by the minister. 935 km of terrestrial and sub-fluvial fibre is in service on the Bangui-Douala corridor with spurs to Cameroon and Congo, and no new kilometrage, commissioning or route was added through the window. The minister's claim of about 1,200 km in July 2025 is unverified and the development bank is the announcer of record for the 935 km. The 2026 estimates appropriate FCFA 2,000,000 to connect prefecture capitals to Bangui over it. 2026-02-02 — against that, the minister stated a 12,000 km fibre commitment at the ministry's orientations ceremony, with no contract, financing, route, phasing or timetable held and no progress in the six months since. The figure is roughly ten times the backbone built to date and reaches this repository through a speech. A two-million-franc line to connect the prefectures and a twelve-thousand-kilometre announcement are the two ends of the same year's policy.	NO CHANGE
Connectivity	**International internet bandwidth**	A published assessment set out the options for reaching submarine cable capacity other than through Cameroon (assessment). 2026-10-08 — ministers agreed on the need to carry out a fibre interconnection with the Democratic Republic of Congo, toward the cable landing at Moanda; no timetable or financing was announced. A published assessment set out the options for reaching submarine cable capacity other than through Cameroon (assessment). It is an analysis, not a route secured.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	**Internet Exchange Points**	A national internet exchange point was created in January 2026, known to the repository only through a foreign operator's investor filing. 2026-01 — an internet exchange point was created, described as reinforcing digital sovereignty, where none existed. The date carries month precision and the sole source is an operator's half-year investor filing: no government instrument, membership list, peering agreement or traffic figure is held. That an exchange point's creation reaches this repository through a foreign shareholder's financial report rather than through the regulator is the sharpest illustration of the measurement problem in this country. The regulator publishes nothing, reported under quality standards, and its own quality-of-service site is financed and not live.	MOVEMENT
Connectivity	**Satellite broadband licensing and availability**	Satellite broadband went commercially live in March 2026 with 450 government kits, and the regulator began a field sweep against unregistered access points in August. 2026-03-16 — the service went commercially live as the operator's 27th African market, with 450 government kits, on a convention signed in December 2025 with United States embassy involvement. No licence and no service existed before. Enforcement followed at once. Roaming was deactivated on kits acquired abroad that had not met homologation conditions, on traceability and national-security grounds, six weeks after commercial launch. 2026-08-12 — the regulator began a control operation across named capital neighbourhoods identifying unregistered internet-access points, with the ministry estimating about 3,000 users in the country against 200 registered, and the operation to extend progressively to provincial cities. The ratio is the ministry's own estimate, no register total is published, and two of the operators visited said they had not been told registration was required. 2026-09-16 - the regulator's observatory put the operator at more than 70% of 5,380 fixed-wireless clients at end-June 2026, carrying 22.89 million of the half's 36.11 million GB of internet traffic. What limits the service is its price rather than its reach, and that is reported below.	MOVEMENT
Data Storage	**Local data centre capacity (all providers)**	No operating data centre. A tier-three facility is planned with a vendor and a 2025 commercial memorandum is dormant. The country has no data centre in operation on this repository. Two are proposed. The state's is a tier-three facility to be built with a vendor as part of an electronic government modernisation programme, still planned; the commercial one is a memorandum signed in January 2025 and recorded as dormant. A third route is regional: the continental infrastructure programme's regional data-centre work through the central African community, in development. Meanwhile the government secure interconnection network is also planned. No rack, floor-area or power figure exists to report.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Storage	**Local data centre capacity (national providers)**	Nothing is built: a vendor package puts a national Tier III data centre as its first axis, the fifth thread on the same unbuilt facility. Two ministry facilities were recorded under construction in 2022 with no completion record, and a memorandum signed in January 2025 never advanced. 2026-05-27 — a vendor delegation met the ministry on a four-axis package whose first axis is a national Tier III data centre, confirmed the following week. The 2026 pitch repeats a 2022 target for the same facility: five threads, three sponsors, and nothing built at July 2026. The same package's second axis is a dedicated network of five microwave-relay sites interconnecting ministries, with no contract, site list, financing or timetable held. So the state's hosting position is unchanged and its ministries remain unconnected to each other, which is what the minister's own January 2026 statement about heterogeneous state information systems describes. 2026-09-24 — fire damaged part of the electoral authority's data-processing centre, weeks before the October 2026 residual elections; an investigation is open and no cause or damage estimate is given. It is the one state data facility in operation that the repository names, and it is the one that burned.	NO CHANGE
Data Storage	**Off-site backup capacity**	With no operating data centre, there is no second site. Both proposed facilities are planned or dormant. This indicator asks about a second copy, and the repository does not yet hold a first. The state's tier-three data centre is planned, the commercial memorandum behind the other proposal is dormant, and the regional programme that might supply capacity is in development. Nothing published describes where the systems now running — the payroll and human resources system, the tax and customs platforms — are hosted, backed up or restorable from. The question has not been put in any document on the repository.	NO CHANGE
Energy	**Sufficient energy and water for data centres**	A 25 MWp solar plant with 30 MWh of storage cut dependence on diesel generation by 90% and raised domestic generation capacity by 40%. 2025-02-10 — a 25 MWp solar plant with 30 MWh of battery storage was reported in service, cutting dependence on diesel generation by 90% and raising domestic generation capacity by 40%, with prepaid metering installed for all non-essential public facilities and the national utility's commercial systems revamped. No utility report, tariff schedule or commissioning record was on file before it. The record is about national supply and no source ties that generation to digital infrastructure specifically. It matters here because the data centre repeatedly proposed and never built, reported under storage, would need firm power in a country whose access rate is reported under rural electrification, and because the utility's own billing has now moved onto mobile money, reported under payments.	MOVEMENT
Energy	**Grid reliability**	A 50MW solar plant with storage was inaugurated, reported to raise generation capacity by over 60%. The appraisal baseline is stark: 28MW installed and 23MW available, 16 to 18 hours of daily load-shedding and 33% distribution losses. 2026-01-28 - one hydroelectric generating unit was repaired and returned to service, restoring capacity critical to the capital. 2026-08-12 - a 50MW solar plant with 15MWh of battery storage was inaugurated, reported to raise national generation capacity by over 60% and to strengthen grid stability. It is the most significant in-window movement on the power the digital estate depends on, and no post-commissioning load-shedding or availability figure is published against it.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Energy	**Rural electrification**	Electricity access was 17% in 2023, from 14.3% in 2022 with about 0.4% rural, and nothing later is held. Access stood at 17% in 2023, from 14.3% in 2022 when the capital was about 35% and rural access about 0.4%. The figure reaches this repository through a secondary aggregator citing development-bank data, and nothing later is held. Rural access below one per cent is the physical constraint under every connectivity item in this report: the off-grid relay sites blamed for the month-long provincial outage, reported under mobile penetration, are the same constraint expressed as a service failure. No electrification programme, target or rural energy instrument appears anywhere on this ledger.	NO CHANGE
Technical Capacity	**Robustness of government hardware and software**	The regulator's monitoring platform, with 80 terabytes of storage, is the only quantified operational government capability held. 2025-10-28 - the regulator runs a digital monitoring platform at its headquarters, launched in April 2024 with 80 terabytes of storage capacity. It is the only dated, quantified statement of an operational government technical capability the repository holds. Against it, a government-wide cloud strategy is recorded as not developed at baseline, current or actual value, against a target of yes by 31 December 2026. No inventory of government hardware, no software estate, no uptime figure and no refresh cycle appears on this ledger.	NO CHANGE a first stated position with no earlier account behind it
Technical Capacity	**Local capacity to maintain, manage and develop government systems**	A payroll clean-up removing more than 2,000 ghost workers was built by the national informatics office, and nothing later is held. A payroll clean-up removing more than 2,000 ghost workers, built by the national informatics office, is recorded as a project achievement. No later headcount, payroll-value or coverage figure is held, and nothing is dated inside the window. It is the only state management system on file with a delivered result, and the only evidence of a domestic technical unit building anything. Everything else described in this report is a vendor package, a donor project or a platform whose builder is not named — including the ministry-wide planning platform reported under electronic services, whose vendor pre-financed earlier phases from its own funds with no stated recovery mechanism. No workforce, skills or technical-capacity source exists for the country at any date.	NO CHANGE
Cybersecurity	**National cybersecurity readiness**	The national cybersecurity agency appears in no estimates volume for a third year, and the 2026 programme budget carries FCFA 6,000,000 in total for network security and digital trust. The agency was created by the January 2024 cybersecurity law under joint supervision, to secure information systems, handle alerts and regulate the sector, with no establishment record. It appears nowhere in the 2024, 2025 or 2026 estimates under any wording; a search for the word cyber returns nothing across 602 pages of estimates and 183 pages of programme budget. What is appropriated is FCFA 4,000,000 for network and information-system security and FCFA 2,000,000 for digital trust — FCFA 6,000,000 for the whole country for the year, against FCFA 1,600,000,000 transferred from the same ministry to the regulator. The one capability the repository can point to as delivered rather than announced is a cybersecurity and electronic-certification platform listed in a funder's delivered scope at the backbone inauguration, with no operator, uptake or certificate-issuance record, and no held source names it again. A 2022 appraisal found the country had no strategy, response team or operations centre. 2026-09-29 - a memorandum with a data-infrastructure and AI company provides for a national computer emergency response team and a security operations centre; neither is recorded as built, and no cost or timetable is published.	NO CHANGE

DPI

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Exchange	**National data exchange system**	A national platform is operationally effective at one ministry, with its interoperability architecture still out to tender. 2026-02 - the platform became operationally effective at the planning ministry - data migrated, staff use made mandatory, launch ceremony held, and was launched publicly in late February. One ministry using one platform is the whole of the national exchange the repository holds. The layer beneath it is commissioned and not designed: a US$300,000 technical-assistance contract for interoperability architecture sits in the digital governance project's procurement plan. No second ministry, no exchanged dataset and no service consuming another's data is recorded.	MOVEMENT
Data Exchange	**Use of digital id in other systems**	The unique identification number was made mandatory, and a government platform that could carry it is at pilot stage. The legal precondition is in place: the unique identification number was made mandatory, recorded in a financier's completion report of June 2025. What consumes it is harder to find. The biometric electoral register is the largest population database in the country and is not described as keyed to the number. The platform that would join them is at pilot stage, and the national digital identity system is planned. The identity card itself is a source of exclusion rather than access, with extortion and discrimination reported around its issue.	MOVEMENT
Data Exchange	**Interoperability of health systems**	The district health software is deployed across all 35 health districts, with an electronic medical record assigning its own patient identifier. 2026-05 - the district health information software is deployed across all 35 health districts, documented in a community poster accepted for the software's own annual conference. 2026-03 - an electronic medical record deployed with the health ministry and a foundation assigns each patient a unique identification on registration and structures clinical data automatically. That identifier is the record's own, and nothing links it to civil registration or to the national number. 2026-03 - vaccination microplanning was digitised into the district software for one health region.	MOVEMENT
Data Exchange	**Interoperability of education systems**	The education management and human-resources systems are financed under a successor project; no exchange between them is held. The education management and human-resources information systems are carried as a component of a project approved in June 2024 and effective that December, with operational start-up recorded in March 2025 and their standing set out in a closed project's completion report. Nothing records the two exchanging data with each other, with civil registration or with the identity system, and the country has no interoperability architecture yet - it is out to tender.	NO CHANGE a first stated position with no earlier account behind it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Exchange	**Interoperability of social protection systems**	A social registry is in development under a food-crisis project, with a payment platform for transfers at feasibility stage. Both halves of a social protection system are being procured at once and neither exists yet. The register is in development under a food-crisis project's additional financing, and the payment layer is at feasibility tender stage. Nothing describes exchange between them, or between either and the mandatory unique identification number that would let a beneficiary be recognised across both. Where transfers reach people today they reach them over mobile money, and the salary payment case shows the fragility of that when a province loses network for a month.	MOVEMENT
Digital Identity and CRVS	**Robustness of system**	A US$13m digital identity system was announced with an implementation window of 2027 to 2032, while police at one prefecture are reported demanding FCFA 100,000 to 200,000 for a card whose legal price is FCFA 4,500. 2025-11-28 — a US$13m integrated system built around a unique identification number, managed by a new identification office and unifying existing biometric and civil-registration databases, was announced with an implementation window of 2027 to 2032 and assessments, procurement and an international tender still ahead. It is an announcement rather than delivery, and the account reads as a project communiqué. 2026-06-16 — the existing credential moved the other way. The legal tariff of FCFA 4,500, restored by interministerial order in June 2025 after five years of overcharging, holds on paper while at one prefecture police are reported to serve one religious group first and to demand FCFA 100,000 to 200,000 from another, requiring the father's and grandfather's birth certificates. The card is the gateway document for the electoral roll and most administrative access, so the movement is in access and price rather than in technology. The second document rail is unchanged: biometric passport issuance resumed under a new operator with payment funnelled through only two banks, and no volume, price or coverage record has been held since.	MIXED a national digital identity system announced for 2027 while access to the existing card is priced informally
Digital Identity and CRVS	**Registration of entire population**	A late birth-registration campaign reports 61,000 additional registrations in the capital prefecture. 2026-01-29 - a campaign run by the territorial administration ministry with a European partner reports 61,000 additional registrations in the capital prefecture. It is late registration of people already born rather than registration at birth. The step behind any wider effort is being scoped rather than taken: a national physical-archiving expert was recruited to diagnose civil-registry archive holdings across registry centres, courts, health facilities and justice bodies. No national registration rate, no total registered and no target appears on this ledger.	MOVEMENT
Digital Identity and CRVS	**National maintenance of id and credentials systems**	The identity card is issued and its issue is reported as a site of extortion and discrimination. Passport issuance resumed in 2025. Maintenance here means whether a person can obtain and renew a credential, and the answer is uneven. The national identity card's legal basis is held, with extortion and discrimination reported around its issue at Ndélé. Biometric passport issuance resumed in January 2025 after interruption. The diagnostic the repository rests on is old — a 2017 identification system assessment — and the successor is not built: the national digital identity system is planned. No renewal cycle, revocation route or correction procedure is published for any credential.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Identity and CRVS	**Authentication**	The foundational diagnostic records no functioning national digital identity authentication service; nothing since replaces it. The foundational identification diagnostic records that no functioning national digital identity authentication service existed, and names the country's largest digital database at the time. It remains the repository's only systematic account of the identification estate, and it is nine years old. Since then the only related fact held is that the unique identification number is recorded as mandatory - an obligation without an authentication service behind it on the record. No verification transaction, service level or consuming system is published.	NO CHANGE a first stated position with no earlier account behind it
Digital Identity and CRVS	**Digital id from birth**	Registration is being caught up by late campaigns rather than at birth; no identifier is issued at the birth event. What the repository holds is the opposite of registration at birth: a late birth-registration campaign reporting 61,000 additional registrations in the capital prefecture, catching up people already born. No system issues an identifier at the birth event. The health system does assign one - an electronic medical record deployed with the health ministry assigns each patient a unique identification on registration - but it is the clinical record's own number and nothing links it to civil registration or to the national identifier.	NO CHANGE a first stated position with no earlier account behind it
Digital Identity and CRVS	**Interoperability of birth registration and digital id**	Civil-registry archives are being diagnosed before digitisation; no link to the identity system is held. 2026-03-30 - a national physical-archiving expert was recruited to diagnose civil-registry archive holdings across registry centres, courts, health facilities and justice bodies - the step before any digitisation of what those holdings contain, let alone a link to an identity system. 2026-07-17 - agents were trained in scanning and securing communal and judicial civil-registry documents. Scanning is not interoperability. Nothing on this ledger records a birth record passing to the identity system, or an identifier being issued from one.	NO CHANGE a first stated position with no earlier account behind it
Digital Identity and CRVS	**Use by other systems**	The unique identification number is recorded as mandatory; no consuming system is named. A development bank's completion report for a general budget-support operation records the unique identification number as made mandatory - the clearest statement the repository holds that one identifier is required across other systems. No instrument imposing it is named, no coverage figure is given and no system is stated to consume it. The one system that assigns an identifier on the record is clinical rather than national: an electronic medical record deployed with the health ministry assigns each patient a unique identification on registration, which is its own numbering, not the national one.	NO CHANGE a first stated position with no earlier account behind it
Digital Payments and Fintech	**Governance role of central bank**	The governing central bank is regional. Its financial inclusion strategy and 2024 payment services report are what bind here. Payment governance is not a national function in the Central African Republic. The regional central bank sets the financial inclusion strategy and publishes the payment services report against which national performance is read, which is where the country's share of regional electronic payment appears. The region also sets the technical rule: an interoperable code-payment standard adopted in July 2026. Nothing on the repository records a domestic monetary or payments authority acting on its own account, and consumer harm is handled by operator warning rather than by regulation, as with mobile-money impersonation fraud.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Payments and Fintech	**G2P functionality**	Officials outside the capital are paid by mobile money and went unpaid for a month when one operator's network failed, against 1,702 civil servants enrolled in May 2025. 1,702 civil servants in regions without banking services were being paid by mobile money, recorded as a project achievement in May 2025. No later enrolment figure is held. 2026-07-28 — at one town subscribers reported no calls, no internet and no mobile money for close to a month, with prepaid bundles expiring unused and some officials unpaid for the previous month. Single-operator dependency with no redundancy is the mechanism. A payroll rail that fails for a month is not a payroll rail. The state has moved salaries onto a private network in places where it has no alternative, and nothing on this ledger records a fallback, a service-level obligation or a redundancy requirement on the operator.	STALLED
Digital Payments and Fintech	**Revenue collection**	The online tax platform launched in March 2025 with four modules and 301 large and 325 medium firms in scope; no filing, payment or coverage figure has been published since. The platform launched officially after adoption and training from January 2025, with four modules including registration for the unique identification number, run by the tax directorate under a 24-month external service contract, and 301 large and 325 medium firms in scope. Nothing on it is dated inside the window, no filing, payment or coverage figure has been published, and the 2026 estimates carry no line for it. The fiscal case for it is now made from outside: a public finance review estimates that digitising the tax administration could raise up to two points of national output in the short term, reported under data governance. The system that would do it has been live for eighteen months and has published nothing about what it collects. Customs is the line with money behind it, reported under domestic financing.	NO CHANGE
Digital Payments and Fintech	**B2B and B2G functionality**	An operator and a customs supplier launched automated mobile payment of the import declaration fee in July 2026. 2026-07-03 - an operator, a customs technology supplier and a state entity launched automated mobile-money payment of the prior import declaration fee, with automatic generation of the declaration reference. It is a business-to-government rail on the customs chain and the clearest one the repository holds. No transaction volume, value or share of declarations paid this way is published. The other government-facing rail on the record runs the other way: mobile-money salary payment for officials outside the capital, which the same ledger carries as not held.	MOVEMENT
Digital Payments and Fintech	**P2P, P2G and P2B functionality**	State electricity bills became payable over mobile money at an official launch in August 2026, on a contract dated October 2025. 2026-08-04 — state electricity bills became officially payable over one operator's mobile-money service, for subscribers including those in five named towns, under a contract dated October 2025. No tariff, transaction fee, volume, revenue share or exclusivity term is disclosed, the two companies are the only announcers of record and no regulator is named. The report states subscribers were already paying this way before the ceremony, so the launch date belongs to the agreement rather than to first use. It is the first person-to-government payment channel on this ledger and it is a bilateral arrangement between a utility and one operator, in a country where a single operator's month-long outage has already stopped salary payments.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Payments and Fintech	**Population uptake**	The country held 0.43% of regional payment-operation volume in 2024, and the regulator counts more than 702,000 active mobile-money clients at end-June 2026. 2026-04-08 — the regional central bank's 2024 payment-services report puts the country at 0.43% of regional payment-operation volume, the smallest but one, against the largest member state's 65.10%. The report holds no value figure or account count for the country. 2026-09-16 - the regulator's observatory counts more than 702,000 active mobile-money clients at end-June 2026, the first national wallet figure the repository holds. No transaction total, agent network figure or account-ownership survey appears at any date. The uses that do exist are narrow and state-driven: salaries for officials outside the banking network and, since August 2026, electricity bills — both reported above, both dependent on one operator.	NO CHANGE
Digital Payments and Fintech	**Cross-border functionality**	The region adopted an interoperable code-payment standard in July 2026, on top of free movement on biometric identity documents. Cross-border payment here is a regional construction. The interoperable code-payment standard adopted in July 2026 is the instrument that would let a payment initiated in one member state be accepted in another, and the country's participation is measured only through its share of regional electronic payment. The identity side is already settled: free movement across the region on biometric identity documents. What is not published is any volume, corridor or remittance figure for the country, and the customs side moved separately through transit interoperability. The regional switch was live across the six member states with 91 participants by 2021, settling on a deferred net basis at the regional central bank (case study). No per-country participation figure is given.	MOVEMENT
Digital Payments and Fintech	**Consumer protection**	A community fact-checking network debunked a mobile-money phishing scam; no regulator or operator response is held. 2026-07-06 - a community fact-checking network debunked a messaging-app phishing scam impersonating a mobile-money service with a fake prize contest harvesting phone numbers and personal identification codes. The response the repository holds is a fact-check by a non-state body. No regulator statement, operator advisory, complaint count, reimbursement rule or remedy for a defrauded user appears anywhere on this ledger, and no consumer-protection instrument covering electronic payments is held.	NO CHANGE a first stated position with no earlier account behind it
Registries	**Population register**	No population register is held; what exists is late registration catching up on people already born. The repository holds no national population register. The nearest thing is the civil-registry estate, whose archive holdings are being diagnosed by a recruited expert before any digitisation, and a late registration campaign reporting 61,000 additional registrations in the capital prefecture. The one register-shaped statement on the record is that the unique identification number is mandatory, with nothing said about what it is drawn from or how many hold one.	NO CHANGE a first stated position with no earlier account behind it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Registries	**Civil register**	A civil-status modernisation programme targets 400,000 birth certificates by 2028 and put its 2025 activities at 90% complete, beside a 3,000-certificate regional project. 2026-02-20 — a steering committee validated the implementing partner's 2025 activities on an externally funded civil-status modernisation programme run with the territorial administration ministry, extending from a capital-and-corridor pilot to new communes, with a target of 400,000 birth certificates by 2028 and 2025 activities put at 90% complete. It is a single source with no financing figure, contract or end date stated. 2025-08-12 — beside it, a regional birth-registration project targets 3,000 certificates in the country, launched eleven days into the window with no progress, delivery or completion record since. It is an order of magnitude smaller than the modernisation programme. Civil registration is the input to the identity card and to the digital identity system announced for 2027, and both programmes carrying it are externally run.	MOVEMENT
Registries	**Address register**	The addressing convention is post-office-box based, with no street numbering, postcode or national physical address register. The international postal reference for the country records the operative addressing convention as post-office-box based, with no street numbering, no postcode and no national physical address register. That is a dated, cited statement of absence rather than a gap in the record, and nothing since 2022 changes it. No addressing project, digital address system or geocoding initiative appears anywhere on this ledger - which bears on everything that would need to reach a household: registration, transfers and service delivery alike.	NO CHANGE a first stated position with no earlier account behind it
Registries	**Business register**	The single-window agency states complete digitalisation of registration procedures and opened a third territorial branch. The agency's own history states a 2025 milestone of complete digitalisation of business-registration procedures, including online pre-registration and electronic handling. 2026-02-02 - it opened a third territorial branch, after the capital and one other town, extending on-the-spot company registration, modification and dissolution beyond the capital. Both accounts are the agency's own. No registration volume, processing time, register size or online-versus-counter split is published, so what is established is that the procedure is digital and the counters are spreading, not what either delivers.	MOVEMENT
Registries	**Social protection register**	A safety-nets project finances the social registry and a second additional financing of US$50m was approved in May 2026. A closed project established a social registry and a fully digitised payment system as the foundations of a social-protection system, transferred to the responsible ministry. The registry's development is financed by a safety-nets project appraised in May 2024, and a second additional financing of US$50m, taking emergency support to US$150m, was approved on 28 May 2026, scaling emergency cash transfers. No registered-household figure, coverage rate or update cycle for the registry is published at any point.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Registries	**Electoral register**	The definitive electoral list reached 2,398,158 registered voters, 757,075 of them registered in 2025, used across 3,910 voting centres. 2025-08-23 — the electoral authority published a definitive list of 2,398,158 registered voters, 1,641,083 carried from the 2020 revision plus 757,075 registered in 2025, used on 28 December 2025 across 3,910 voting centres. Adding almost half again to the roll in one revision is the largest registration operation on this ledger. The defect is small and telling: the authority's own provisional results state a turnout percentage computed on an electorate 5,212 lower than its definitive list, which no source reconciles. The roll rests on the identity card reported above, whose issuance at one prefecture is reported as religiously targeted and informally priced.	MOVEMENT
Registries	**Tax register**	The first structured official report evaluating the tax and customs measures describes the online tax platform as the operative system. 2026-05 - the first structured official report evaluating the measures describes the online tax platform alongside the customs system as the operative digitalisation. The platform was launched in 2023 with European funding for online enrolment, declaration and payment. 2025-10 - the fiscal risk statement accompanying the budget bill records tax administration weaknesses among five risk categories to revenue mobilisation. No taxpayer count, enrolment figure or online-filing share is published, so the register behind the platform cannot be sized.	MOVEMENT
Registries	**Land register**	122 tokenised plots sold for about US$38,308 by November 2025, while the cadastre carries FCFA 625,000 for the mining register and FCFA 650,000 for a petroleum database. Tokenised land concessions opened in June 2025 under presidential decree over 1,700 hectares, and 122 plots had sold for about US$38,308 by November 2025 at a fixed price of about US$314 each, with a flagged expansion to mineral rights not recorded as happening. The terms are unreconciled between the two accounts, which agree on location but not on pricing. The registry underneath has not been built. A US$1.6m agreement of April 2024 covered a second phase of public-administration digitalisation including an electronic cadastre, no cadastre delivery record is held, and the 2026 framework carries FCFA 625,000 for updating the mining cadastre and FCFA 650,000 for a petroleum database — FCFA 1,275,000 for the year between them. 2026-07-31 — a memorandum with a Gulf counterparty adds land-administration modernisation to the stated programme, with no commitment figure or governance arrangement.	MIXED land was tokenised and sold while the cadastre it would rest on has no delivery record
Sectoral management information systems	**Health**	The health ministry runs a routine health information system offering fewer functionalities here than in three comparators, and a remote hospital began using telemedicine. 2025-12-01 — a four-country study of newborn-data functionality finds the health ministry's routine information system offers users here fewer functionalities than in the three comparators, against a US$70m health service delivery and system strengthening project running since 2022. No sector management information system was on file before this. 2026-08-18 — a remote hospital is reported using telemedicine to reach a global network of healthcare professionals, run by an international medical organisation. It is an operator-run service at one site rather than a state system, with no case volume, connectivity arrangement or continuity plan published. No education-sector system is on file, so health is the whole of the country's sectoral systems record.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Sectoral management information systems	**Education**	A completion report is the clearest statement of where the education management systems stand, and a successor project carries a component on them. 2026-06-15 - a closed sector plan support project's completion report is the repository's clearest statement of where the education management and human-resources information systems stand. A successor project approved in June 2024 and effective in December 2024 carries a component on them, its operational start-up recorded in March 2025. Neither states a school count on the system, a data-collection cycle completed or a statistic published from it, so the position is that the systems are financed and nothing is known of what they hold.	MOVEMENT
Sectoral management information systems	**Social protection**	The social registry is financed and scaling on a second additional financing, and its payment platform is out to tender. The management system is the social registry, established with a digitised payment system by a closed project and transferred to the responsible ministry, now financed for development by a safety-nets project and scaled by a US$50m second additional financing in May 2026. 2026-03-03 - a procurement notice requested expressions of interest to design and operationalise a payment platform for social-safety-net beneficiaries - a payment system established by the closed project being designed again.	MOVEMENT
Sectoral management information systems	**Justice**	The justice sector policy calls for judicial statistics and computerisation; its term expired in 2024 with no successor. The first integrated criminal database was established on 9 October 2026, the UN mission financing the centre, equipment and servers and UNODC providing expertise, training and connectivity; extension to the judicial police and the regions is the stated next step. A second report records the centre's inauguration at the interior ministry. The sector policy adopted on 12 December 2019 calls for developing judicial statistics collection and analysis and for computerisation. Its term ran to 2024 and no successor is held, and no judicial statistic appears anywhere on this ledger. 2022-03 - a provisional criminal database was installed at the judicial police directorate after criminal-records training. Provisional is the word the record uses, and nothing since says what became of it.	NO CHANGE a first stated position with no earlier account behind it
Sectoral management information systems	**Tax**	The finance ministry's roadmap sets eight reform axes and the fund's programme carries benchmarks on platform use by large taxpayers. 2025-03-26 - the ministry's own roadmap sets eight reform axes covering tax, procurement, and integrated financial and human-resources management. 2025-05-21 - a fund programme review records the tax and public financial management digitalisation commitments as active conditionality, with new structural benchmarks on use of the tax platform by large taxpayers - the sharpest external pressure on the system the repository holds. 2026-05 - the first structured official evaluation report describes the platform as operative. No declaration volume, revenue attributed or compliance rate accompanies any of it.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Sectoral management information systems	**Customs**	A regional mission assessed customs interoperability and prepared the transit-tracking system in April 2026. The operative system is the customs platform the tax and customs evaluation report describes alongside the tax platform. 2026-04-22 - a neighbouring customs administration's mission assessed interoperability between its own platform and the customs system this country uses, and prepared implementation of the regional transit-tracking system. 2025-12 - a European mission trained ten customs judicial police officers on digital drafting of customs reports under the national border management plan. No declaration volume, clearance time or transit record is published.	MOVEMENT
Sectoral management information systems	**Land**	The land ministry publicly denied that parcels could be bought online or by mobile money. 2026-07-09 - the urban planning and land reform ministry denied publicly that land parcels could be bought through an online platform or by mobile money. It is a denial issued against fraud, and it is strong evidence from the ministry that would run one that no transactional digital land service exists. The finance minister's own survey of ministry applications names an electronic cadastre among them, and this ledger separately carries cadastre and land-registry digitisation. Neither carries a parcel count, a registration volume or a service a citizen can use.	NO CHANGE a first stated position with no earlier account behind it
Other GovTech and e-Gov	**e-government services**	A unified public-services portal launched in December 2025, a whole ministry moved onto one platform, and a treasury single account application was deployed. 2025-12-12 — a single entry point for administrative tasks, request and complaint tracking and access to official documents went live, with expansion to health, education and tax stated as planned. Its external financing attribution is asserted only by the launch report, and no usage, registration or transaction figure is held. 2026-02-27 — one ministry put human resources, budget, document management, project management, macroeconomic modelling and donor-financing tracking on a single platform, with a central register of government, international and humanitarian projects, launched under presidential patronage. The vendor pre-financed earlier phases from its own funds with no stated recovery mechanism, the platform's cost is stated nowhere, and its efficiency figures are projections rather than measurements. 2026-07-28 — a treasury single account application was deployed, tied to regional banking rules, with the stated object of centralising state balances and eliminating parallel and opaque accounts, and integration with the regional settlement rails. No cost, financier, vendor, timetable or number of accounts closed is stated, and the architecture is explicitly regional rather than national.	MOVEMENT

Digitalisation

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digitalisation of sub-national government	**ICT infrastructure for local government**	Four prefectural chief towns were equipped with technology kits by January 2022; no later inventory is held. A development agency's initiative, launched in May 2020, had equipped four prefectural chief towns with technology kits by January 2022. 2026-04-24 - one commune's town hall was rehabilitated with European funding, the next stated step being technology equipment and staff training for digitising civil-registry documents. 2026-07-18 - the civil-registry directorate presented its own account of local digitisation: the prefectural kits, scanning training for communal and judicial registry staff, and the rehabilitated town hall. Four prefectures and one commune, four years apart, remain the whole of the equipment the repository holds. No inventory of local-authority equipment, no connectivity figure for prefectures or communes, and no national programme appears anywhere.	NO CHANGE a first stated position with no earlier account behind it
Digitalisation of sub-national government	**Digitalisation of local government records**	Agents were trained in scanning and securing communal and judicial civil-registry documents in July 2026. 2026-07-18 - the civil-registry directorate's own presentation to a directors' meeting is the clearest dated statement of local digitisation the repository holds. 2026-07-17 - agents were trained over two days in scanning and securing communal and judicial civil-registry documents, under a European-funded project. Behind those, a development agency's initiative had equipped four prefectural chief towns with technology kits by January 2022, and one commune's town hall was rehabilitated in April 2026 with equipment and training for digitising civil-registry documents named as the next step. No count of records digitised anywhere is published.	MOVEMENT
Rural digital data capture	**Digitalisation of rural health clinics**	Vaccination microplanning was digitised for one health region across workshops in two towns in March 2026. 2026-03 - vaccination microplanning was digitised into the district health software for one health region across workshops in two towns, producing per-health-facility microplans and interactive health-area maps. It is planning data for facilities rather than data captured at them. The wider system is in place: the district health software is deployed across all 35 health districts. What the repository does not hold is any figure for facilities entering data themselves, connectivity at rural facilities, or how reports reach the district where they cannot.	MOVEMENT
Rural digital data capture	**Digitalisation of rural primary schools**	The universal service fund's 2026 budget carries school and community connectivity, and a first free public wifi point opened at Bocaranga. Connectivity is reaching provincial towns before it reaches schools. The universal service fund's 2026 budget includes school and community connectivity, and the country's first free public wifi point opened at Bocaranga in April 2026 under bilateral cooperation. The system that would collect from schools is being rebuilt rather than extended: education management and human resources systems, on a financier's completion report of June 2026. No count of schools with equipment or a connection is published at any level, rural or otherwise.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Rural digital data capture	**Digitalisation of rural registry offices**	Agents were trained in scanning communal and judicial civil-registry documents in July 2026. 2026-07-17 - agents were trained over two days in scanning and securing communal and judicial civil-registry documents under a European-funded project, the directorate's own presentation of the state of local digitisation following a day later. 2026-04-24 - one commune's town hall was rehabilitated with European funding, the next stated step being equipment and training for digitising civil-registry documents. The archives themselves have not been surveyed: an expert was recruited in March 2026 to diagnose the holdings.	MOVEMENT
Rural digital data capture	**Digitalisation of rural police stations**	Nothing describes a system at a police station. The repository's rural evidence is the other way: a province spent a month without operator network. No source on this repository names a police record system, a case platform or a station-level deployment anywhere in the country, rural or urban. Where local administration is being digitised it is civil status rather than policing: local-government digital systems in development. The condition that governs any such system is connectivity, and the window's evidence is a failure of it: Batangafo spent a month without operator network. Against a fibre backbone that reaches only part of the country, a station system outside the capital would have nothing to report over.	NO CHANGE

Technology

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
AI	**Use of AI in government administration**	No model runs in a state service. What exists is external research: machine learning on subnational food prices and a language model for the national language. The repository carries an explicit finding that no artificial-intelligence system is deployed in state service, and nothing in the window changes it. The two working applications are research artefacts produced outside government: machine learning applied to subnational food price monitoring, and machine translation for the national language published on a model repository. Institutional participation is real and thin: national participation in the continental artificial-intelligence community, with the national policy or strategy still in development.	NO CHANGE
AI	**Use of AI in sectoral management information systems**	A development bank's price platform imputes missing subnational food-price observations by machine learning; no state system uses it. The clearest instance of machine learning inside a sectoral information system is a development bank's real-time prices platform, which uses a machine-learning approach to impute missing subnational food-price observations for the country. It is run outside government and imputes what the national system does not collect. A continental research body's model, run on remotely sensed satellite data, projected the 2025 cassava production on the same pattern - a figure produced abroad about a domestic sector. No ministry system on this ledger is stated to use artificial intelligence at all.	NO CHANGE a first stated position with no earlier account behind it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
AI	**Development of national / regional AI systems**	An independently built translation system for the national language is the first such system the repository holds, and it is not the state's. 2026-05-13 - a production translation system for the national language uses vocabulary-augmented prompting over a 581-entry verified lexicon. It is independently built and non-governmental. 2026-08 - a national representative's own account records the country represented at the continent's main machine-learning gathering and a national artificial-intelligence pioneers grouping introduced; no membership, funding or output is published. Both sit against a national strategy that has been in elaboration since November 2024 and has produced no text.	MOVEMENT
AI	**Control of AI abuse**	The broadcasting regulator asked for tighter identification against deepfakes and artificial-intelligence disinformation in June 2026. No instrument answers it. The window produced a request and no rule. The broadcasting regulator asked for tighter identification in response to deepfakes and artificial-intelligence disinformation in June 2026 — the first time a Central African regulator has put the question on the record. Nothing exists to answer it. The national artificial-intelligence policy is in development, the data protection law of 2024 has no authority to enforce it, and the cybersecurity and cybercrime law predates generated media. A separate identification measure is being pursued for a different reason: tracing through mobile subscriber cards.	MOVEMENT
ICT Industry	**National capacity in DT-related production**	A locally built school-management platform is the clearest instance of domestic production; the authoritative diagnostic dates from 2020. The authoritative account of the digital economy including the firms that build and sell digital products is a development bank assessment of 2020, and nothing has replaced it. 2025-10-10 - a company's own announcement records a locally built school-management software platform - the clearest instance of domestic digital production the repository holds, and a first-hand account rather than an independent one. 2026-09-16 - the regulator put operators' combined revenue above FCFA 41.68bn including tax in the first half of 2026, 57% of it from mobile telephony and 36% from internet. No employment figure, firm count or export figure is published, so beyond operator turnover the position is one named product and a six-year-old diagnostic.	MOVEMENT
Innovation ecosystem	**Technology hubs**	A foundation founded in 2023 describes itself as the country's first incubator and announced a partnership in February 2026. The foundation, founded in 2023, describes itself as the country's first incubator dedicated to youth and diaspora entrepreneurs and states a three-year ambition. It is its own account of itself. 2026-02-28 - a partnership with a national initiative was announced. Alongside it sits a digital training centre and incubator financed at EUR 17m by the European Union and EUR 13m by a development bank, with a stated capacity of 50 trainees. No cohort size, funding raised, graduate count or surviving venture is published for either.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Innovation ecosystem	**Tech startup ecosystem**	Bitcoin's legal-tender status was revoked, the state token is defunct with the status of invested funds unclear, and the presidential coin lost more than 75% of its value. Parliament amended the April 2022 cryptocurrency law and revoked bitcoin's legal-tender status, making acceptance optional, with no restoration or replacement instrument recorded. The country was the first African state to adopt it. The state-sponsored token is defunct: 10% of a 210-million token target sold, under EUR 2m raised, the promised crypto city and island never built, the website offline and the status of funds already invested recorded as unclear. It had been marketed with passports at US$60,000 and land at US$10,000 held in the token. The presidential meme coin passed US$900m in market capitalisation over its launch weekend and then lost more than 75% of its value, and remains the payment rail for the tokenised land concessions, with no evidence that its revenues were declared as public income or entered the national budget. The rest of the private technology record is two named firms with no dated transaction: no startup, accelerator cohort, funding round or sector revenue figure exists for the country.	REGRESSED

Capacity

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Literacy	**Digital literacy (civil service)**	A digital records-management training reached 15 participants in December 2025; no civil-service skills measure is held. The government signed a five-year partnership with Russia on 9 October 2026, implemented through HSE University, for digital-governance training of public servants, joint research and expert seminars. The repository holds no cohort, budget or start date for it. 2025-12-16 - a European mission ran a digital records-management training for 15 participants including staff of one ministry. 2025-12 - a separate mission trained ten customs judicial police officers on digital drafting of customs reports under the national border management plan. Both are donor-run and both are counted in tens. No civil-service digital skills assessment, training plan or headcount trained appears on this ledger, so the position is the sum of what individual missions record.	NO CHANGE a first stated position with no earlier account behind it
Literacy	**Digital literacy (general population)**	Only 4.1% of men and 1.5% of women hold the technology competences the national survey tests. The measured position comes from the national household survey, fieldwork 2018 to 2019: 4.1% of men and 1.5% of women hold the information and communication technology competences it tests. It is the source-of-truth figure and it is the only one. Nothing published since measures it again. A seventh-round survey is on this ledger as the instrument that would, and no result from it is held. Against a figure that low, what the repository holds by way of response is a digital records-management training for 15 officials.	NO CHANGE the measured figure is seven years old and nothing has replaced it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Training and skills	**DT-related training in secondary education**	A ten-year education cooperation framework was signed covering educational technologies and digital learning. The standing statement is a country technology profile of May 2023, the most directly on-topic authoritative account held. 2026-06-19 - a ten-year framework signed with another state covers nine priority areas including teacher training, pedagogical and curricular engineering, educational technologies and digital learning, school planning and student-support tools, preceded by a briefing on the partner's own education-digitalisation initiatives. It is an intergovernmental commitment with no budget, timetable or classroom implementation on the record.	MOVEMENT
Training and skills	**DT-related university facilities and qualifications**	A digital training centre and incubator opened at the university in January 2024, and its technology institute supplies most of the country's engineering graduates. A government digital training centre and start-up incubator opened at the university in January 2024, financed jointly by the European Union and a development bank as a component of the fibre backbone project and opened alongside the launch of broadband service. No enrolment, cohort or budget figure has ever been published for it, and nothing on it is dated inside the window. The university's technology institute supplies most of the country's professional engineering graduates in civil, industrial, computing, mining and geological engineering, and runs a master's in engineering sciences, on a standing institutional description carrying no date, enrolment or research-output figure of its own. No digital-literacy programme, skills measurement or training line appears in three consecutive years of estimates.	NO CHANGE
Training and skills	**Graduates entering DT ecosystem**	A bootcamp for 17 recent graduates ran at the national university, and a digital content bootcamp held its second edition. The largest facility is a digital training centre and incubator in the capital, financed at EUR 17m by the European Union and EUR 13m by a development bank, with a stated capacity of 50 trainees. 2026-03 - a three-day professional project bootcamp ran at the national university for 17 recent graduates, 12 of them women. 2026-05-28 - a second edition of a digital content creation bootcamp covered blogging, podcast and video production, fact-checking, search optimisation and cybersecurity. Every figure here is in tens, and no graduate destination or placement rate is published.	MOVEMENT
Research institutions	**Think tanks and academic departments contributing to DT policy**	The national university's multimedia resource centre, established in 2002, is the clearest academic unit with a digital remit held. The university's multimedia resource centre, established in 2002, is the clearest academic unit with a digital remit the repository holds, and its own page is the source. 2026-05 - a conference paper by researchers based in the country studies the university's deployment of a communication platform as a digital-sovereignty case; its full text is behind a paywall and only the abstract is held. No instance of either being cited in a government instrument, and no think tank contributing to digital policy, appears anywhere on this ledger.	NO CHANGE a first stated position with no earlier account behind it

Inclusion

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Access to services	**Citizen feedback portals**	A unified digital portal was launched in December 2025; the only feedback channel with a count behind it is an agency's. 2025-12 - a unified digital portal was launched as a single point of access to government. No service count, transaction volume or feedback function is described for it. The only channel on this ledger with a figure behind it is not the state's: a refugee operation's complaints and feedback system recording 535 complaints. No government complaint channel, response-time commitment or resolution figure appears anywhere, so what a citizen can do with a grievance is not established.	MOVEMENT
Access to services	**Citizen participation in policy**	Participation is not a channel on this repository. The centralised government portal delivers services, and the state is extending subscriber tracing. Nothing on the repository describes a consultation, a comment procedure or a participatory forum on digital or data policy. What exists is delivery in one direction: a centralised government portal and a unified public services portal, with an operator contributing to accessible public digital services. The one instance of a public body raising a policy question in the window came from a regulator rather than from citizens: the request for tighter identification against artificial-intelligence disinformation. Set against that, the state is extending tracing of citizens through mobile subscriber cards.	NO CHANGE
Access to services	**Gender equity**	The national review report is the authoritative statement of the digital gender divide, against 4.1% of men and 1.5% of women holding technology competences. The national review report of September 2024 is the most authoritative recent statement of the gender dimension of the digital divide. The measured gap beneath it is the household survey's: 4.1% of men and 1.5% of women hold the technology competences it tests - a ratio of nearly three to one on a base so low that both figures are close to zero. No programme, target or obligation addressing it appears on this ledger, and no later measurement exists to say whether it has moved.	NO CHANGE a first stated position with no earlier account behind it
Access to services	**Inclusion of persons with disabilities**	An international study-period report states the position on access for persons with disabilities; nothing national is held. An international study-period report covering 2018 to 2021 states the position on access to telecommunications and technology services for persons with disabilities and others with specific needs. Nothing later exists, and no national measure, obligation, accessibility standard or programme appears anywhere on this ledger. The country's own disability rights report is separately on the repository without a digital dimension. So the position is a five-year-old external assessment and no domestic instrument to check it against.	NO CHANGE a first stated position with no earlier account behind it

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Access to services	**Inclusion of refugees and IDPs**	37,389 Sudanese refugees are registered with card-based registration and a complaints system recording 535 complaints. 2026-08-19 - an operational update for the second quarter of 2026 records 37,389 registered Sudanese refugees, card-based registration, and a complaints and feedback system recording 535 complaints. It is the clearest instance the repository holds of a digital feedback channel reaching a displaced population, and it is run by an agency rather than by the state. A national statistics initiative would count them: an effort under way since September 2025 would include, for the first time, forcibly displaced people and those at risk of statelessness - about 447,000 internally displaced and some 62,000 refugees - in national statistics.	MOVEMENT
Digital divides	**Bridging of digital divides**	The country's first free public access point was inaugurated in April 2026, while the universal service fund is still not operational, with implementation targeted for 2026. 2026-04-24 — the President inaugurated what is presented as the country's first free public internet access point, with technical support from Russian cooperation. It is one site with no bandwidth, uptime, user or funding figure, carried by a pro-government outlet, and the item doubles as campaign copy for a local legislative candidate. The fund that should be doing this work has never operated. The levy was provided for by a 2018 law and a February 2019 decree, its supervising committee's activities launched in July 2025, and effective implementation is named among the regulator's 2026 priorities; it is financed by a 2% levy on operators' previous-year turnover, with scope covering broadband in schools, health centres, town halls, libraries and post offices. It has never published an amount collected, a balance or an allocation in the seven years since the levy took effect, and no collection figure, project award or operator selection is held.	MOVEMENT one public access point opened while the universal service fund reached its eighth year without operating

Data

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
National statistics	**National strategy for development of statistics**	The second statistics strategy is being implemented through a development-bank-financed regional project. 2026-10-10 — a mid-term evaluation held in Bangui on 7 to 9 October, financed by UNDP, is to update the strategy with revised indicators and a realigned calendar. 2026-06-08 - the statistics institute's own workshop report is the most current statement that the second national strategy for the development of statistics is being implemented, through a development-bank-financed regional statistics project. Two strands sit under it. A national data management, processing and dissemination policy was validated in March 2026, and an initiative under way since September 2025 would include forcibly displaced people and those at risk of statelessness in national statistics for the first time. The strategy's own text is not held, and no indicator from it is published.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
National statistics	**Censuses and surveys**	The fourth census completed its third data-cleaning phase in August 2026, a household survey opened six months of collection by tablet, and a seventh indicator survey convened its steering committee. 2026-08-06 — the country's first digital census completed the third phase of data cleaning, running since May 2026, as a step toward definitive results, financed through a regional statistics project with a United Nations agency as technical partner. No enumeration total, publication date or provisional result is stated. 2026-07-23 — enumerator teams deployed nationwide for a harmonised household living-conditions survey covering about 7,000 households in three two-month waves, entirely by tablet, with a public commitment to statistical secrecy and aggregates only. The field period ends around January 2027 and no prior harmonised survey is held. 2026-08-18 — a seventh multiple indicator cluster survey convened its steering committee for the first time, budgeted at 1,942,332,190 FCFA or US$3,531,513, of which about 1.1 billion FCFA was mobilised — about 43 per cent unmobilised on the institute's own figures, with no fieldwork or publication date stated. Three national collections running at once is the most active part of the country's digital record.	MOVEMENT
National statistics	**Statistics from administrative data**	National accounts were rebased from a 2005 to a 2019 base under the newer standard, the review's aide-memoire published in August 2026. 2026-08-07 — national accounts moved from a 2005 base under the 1993 standard to a 2019 base under the 2008 standard, drawing on the 2021 agriculture survey and the harmonised household survey to widen coverage of agriculture, household consumption, self-build, imputed rent and informal activity, with the joint technical and peer review held in February 2023 and its aide-memoire released publicly under a World Bank-financed project. The review it documents was held three years before publication: what is new is the publication, and no rebased output level is stated in the record held. Publication three years after the work is the pattern of this country's statistics, and it is better than the alternative visible elsewhere in this report — a complete quarterly budget execution series published on time as page-image scans whose digits do not extract, with settled accounts running only to 2019.	MOVEMENT
Open data	**Use of open data**	The statistics institute integrated an open licence on its data portal, relaunched its microdata archive and presented a plan to migrate the portal to ODP 2.0 in 2026. 2026-09-20 — at a CEMAC workshop in Libreville the institute presented its national plan to migrate the portal from ODP 1.0 to ODP 2.0 and demonstrated a locally installed ODP 2.0 test environment loaded with the national accounts. No migration date is published. 2026-06-10 - the institute confirms it has integrated a new open licence on its open data portal and institutional website, with a national indicator-update workshop planned for the end of June. 2026-05-29 - its microdata archive, built under a development-bank project and running since July 2020, was relaunched with a modernised interface as part of a wider dissemination upgrade. 2026-05-21 - the licensing question was raised at a webinar run by two international bodies on open-data licensing and dissemination practice. No dataset count, download figure or reuse of the published data appears anywhere on this ledger.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Use of satellite data	**Agricultural use of satellite data**	Ten ministry experts were trained on space-based data for agriculture, and a continental model projected cassava production from satellite data. 2023 - ten agriculture ministry experts were trained on space-based data for agriculture and hydrometeorology under a development-bank project. It is the founding capacity-building activity the repository holds and no output from it is recorded. 2025-10 - a continental research body's model, run on remotely sensed geo-biophysical satellite data, projected the country's 2025 cassava production. The projection is made abroad from satellite data about a domestic crop; no national system produces or consumes it, and no ministry product using satellite data appears on this ledger.	MOVEMENT
Use of satellite data	**Meteorological use of satellite data**	The aeronautical meteorological centre at the capital's airport lists satellite reception among its instruments. The current aeronautical information publication, effective 7 August 2025, lists the main meteorological centre's equipment at the capital's airport, satellite reception among it. It is an equipment list, published by the regional air-navigation agency rather than by a national meteorological service. No national weather product, forecast service, station network or data-sharing arrangement is held, so what the repository can say is that satellite reception exists at one airport for aviation purposes, and nothing about meteorology for anyone else.	NO CHANGE a first stated position with no earlier account behind it

Geopolitics

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
US / hyperscaler activities	**USA / hyperscaler MoUs, engagements and commitments**	The incumbent operator's privatisation entered an operational phase in July 2026 on US$150m announced, with definitive agreements and a schedule still to be established. 2025-09-18 — a privatisation memorandum was signed at a development round table; 2026-07-17 — the minister met the counterparty's operations vice-president and the government declared the memorandum in its operational phase, with US$150m announced covering network modernisation, a data centre and a connectivity programme, and definitive takeover agreements, a joint steering committee and a deployment schedule still to be established. The deal structure is undisclosed, the figure is the counterparty's own and appears in no appropriation. It is the fourth attempted rescue of this incumbent, the previous one agreed in November 2020 and needing EUR 20m before work could start. The state is meanwhile budgeting FCFA 250,000,000 of its own telephone arrears to the same operator for a third year — negotiating a sale while owing the asset money.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
China activities	**Chinese MoUs, engagements and commitments**	A vendor set out a four-axis electronic-government programme — a data centre, five relay sites, unified telephony and a police radio network — with no contract, amount or timetable. 2026-05-27 — a vendor delegation met the ministry on a package whose first axis is a national Tier III data centre; 2026-06-03 — a working meeting set four axes: the data centre, five microwave-relay sites interconnecting ministries, unified telephony and videoconferencing, and a secure police radio network. Nothing existed before it and no contract, amount or timetable is stated; the programme is documented in no appropriation. These two accounts are the only sources under this subject the repository holds for the country, and the fourth axis is carried by only one of them. The data centre it proposes is the same facility three other sponsors have proposed since 2022, reported under storage, and none of them has built it.	MOVEMENT
EU activities	**EU MoUs, engagements and commitments**	European financing runs a civil-status modernisation programme and a EUR 17.5m four-year programme digitising administrative fee collection across about twenty ministries. 2026-04-14 — an implementation workshop with three pilot ministries opened a programme financed at EUR 17.5m over four years, of which EUR 8.5m to one justice component, targeting the small revenues of about twenty ministries and covering issuance of the nationality certificate. It is a single source and no domestic appropriation for it is on file. 2026-02-20 — a steering committee validated the implementing partner's 2025 activities on the civil-status modernisation programme, extending from a capital-and-corridor pilot to new communes with a target of 400,000 birth certificates by 2028, also a single source with no financing figure stated. Between them these two programmes carry the country's civil registration and its non-tax revenue collection, and neither appears in the national estimates — which is the fiscal shape of the whole digital record here.	MOVEMENT
Gulf/UAE activities	**Gulf MoUs, engagements and commitments**	A Gulf memorandum signed at Bangui in July 2026 couples digital finance and land banking, with no commitment figure, schedule or governance arrangement. 2026-07-31 — a memorandum was signed at Bangui by the minister coordinating major works and strategic investments, covering digital finance and land banking, presented as mobilising investment for infrastructure while modernising land administration, with no commitment figure, disbursement schedule, timetable or governance arrangement stated. Nothing of the kind existed before it, and it is the only source under this subject the repository holds; the counterparty is otherwise undocumented. It couples a payments ambition and a land-registry ambition under one offshore private counterparty, and registers as intent rather than finance. Land is the sensitive half. The country has already sold tokenised concessions with no functioning cadastre behind them, reported under the land register, and this memorandum proposes to modernise the register that sale ran ahead of.	MOVEMENT

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
India activities	**India MoUs, engagements and commitments**	India's own bilateral brief carries a 2010 memorandum for a technology centre of excellence at Bangui and the pan-African network build-out. Nothing later is named. The repository previously held nothing here, and the reopened source establishes a standing position rather than a new one. India's embassy publishes a dated bilateral brief carrying two technology facts: a memorandum of March 2010 establishing an information technology centre of excellence at Bangui, and the pan-African electronic network project's tele-education, tele-medicine and senior-official connectivity build-out in the capital. It is the most current dated statement that both remain the record of India-funded technology capacity in the country. No later project, disbursement, extension or successor instrument is named, by either government, in the sixteen years since.	NO CHANGE
Digital sovereignty	**Digital sovereignty**		NO EVIDENCE

Where the record is thin

SYSTEM OR INSTRUMENT	WHAT WOULD SETTLE IT	LAST PROBED
National cybersecurity strategy, response team and operations centre	the promulgated cybersecurity law text, an agency establishment decree, or a national cybersecurity strategy	not yet probed
AI system deployed in state service delivery	a procurement notice, contract, pilot announcement or ministry statement naming a deployed system and a vendor	not yet probed
Enacted appropriation for any year	a text-extractable copy of any of the three enacted finance laws, at line grain	not yet probed
Budget outturn at any grain	a text-extractable quarterly execution report, or a settlement law later than 2019	not yet probed
Universal service fund receipts and disbursements	ARCEP or CDCE accounts showing the 2% contribution collected and spent would settle it; probed 2026-09-25, the fund's implementation was still listed as a 2026 priority	2026-09-25
Recurrent financing after the digital governance grant closes	a finance-law line or transition plan carrying the running costs of systems built under the World Bank digital governance project after 31 December 2026 would settle it; probed 2026-09-25, none published	2026-09-25
Rule on where state data is hosted	a hosting policy, cloud policy or decree fixing where state data sits would settle it; probed 2026-09-25, the GovTech index records none and the data-protection law addresses only personal-data transfers	2026-09-25
Hosting and contract terms of the identity database	the identity-card production contract and a statement of where the database is hosted would settle it; probed 2026-09-25, neither published	2026-09-25
Data terms of the Huawei, Greenline and AIAL agreements	publication of the agreements' data-jurisdiction, portability and exit clauses would settle it; probed 2026-09-25, none published	2026-09-25
