PROGRESS REPORT

Data Exchange: progress report, October 2025 – October 2026

Edition of 2026-10-12 · compiled by Claude Opus from the documents in the Corpus repository

> *54 countries. Each row below is carried verbatim from that country's own progress report, which answers a fixed frame of indicators over the period; nothing is written here. A country not listed under an indicator has* **No evidence** *on it in its own report.*

NATIONAL DATA EXCHANGE SYSTEM · USE OF DIGITAL ID IN OTHER SYSTEMS · INTEROPERABILITY OF HEALTH SYSTEMS · INTEROPERABILITY OF EDUCATION SYSTEMS · INTEROPERABILITY OF SOCIAL PROTECTION SYSTEMS

Progress values. *Movement* — some form of progress, however minor, has been recorded. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the repository holds a standing position and nothing in the period touched it. *No evidence* — the repository holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Movement, regulations still pending*.

The place reports do not share one window; the period above is the range they span.

National data exchange system

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The President's one-month interconnection deadline of 12 July 2026 has no reported completion, and on 20 September the Council of Ministers ordered a presidential decree on a secure interoperability plan. 2026-09-20 - the Council of Ministers ordered a presidential decree on a secure digital interoperability plan setting the missions of the sectoral bodies under the digitalisation high commissioner, and extended interoperability to the wilayas. State media reports a sovereign network, IRIES, linking ministries and public institutions, with no date or reach. 2026-09-03 - a working meeting at the digitalisation commission was devoted to a national system for tracking strategic goods, unifying the data path between the sectors that supply and distribute widely consumed goods. No instrument, budget, operator or delivery date is stated. One sectoral exchange predates the decree's obligations: a digital data exchange protocol of August 2025 between the finance ministry, state property and the notaries gives notaries direct online access to the cadastral and land databases. Nothing states how it relates to the exclusive channel the decree creates.	MOVEMENT
Angola	A US$150m contract for the interoperability platform, digital signatures and digital identity entered execution on 31 July 2026, by sole-referenced award. 2026-08-04 — a US$150m twelve-month contract entered execution on 31 July 2026 for a secure-zone critical-computing component hosting the interoperability platform, key-based electronic signatures, digital identity and structured cybersecurity, financed under a presidential order and inscribed in the 2026 public investment programme. The contract itself was signed in June 2026 and carried in the year's investment programme. It is a sole-referenced state technology award under a presidential order, with the procurement route unstated. No national interoperability platform was in service before it, and no technical standard, published interface or exchange volume is on file — so the country has a contract for an exchange layer and not yet the layer.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	The exchange carried 32.7m requests in 30 days across 73 members and 512 services, and conditions of access were published in July 2026. 2026-07-11 — the operator's public directory records 138,174,337 cumulative requests with 32.7m in the last 30 days, across 73 members, 176 information systems and 512 services, the heaviest providers being land transport, identity and tax. It was already operating at the start of the window; what is new is the scale and the fact that it is published. 2026-07-28 — conditions of access were published: registration in a catalogue of interoperable solutions, demonstrated data governance, compatible infrastructure, conventions naming data, purposes, responsibilities and security measures, and for a private body an adhesion convention plus data-protection authority authorisation before first connection. That makes the authority a step in the technical onboarding path rather than a post-hoc complaint channel. 2026-01-27 — a road-enforcement data platform centralising police, transport and road-safety data is being extended for full interoperability with the exchange. 2026-09-02 — the Treasury told road users to check unpaid traffic penalties on the SECUROUTE portal and settle them by 1 October 2026, with forced recovery on the road after that date.	MOVEMENT in traffic
Botswana	The statutory framework for secure exchange of information and an information gateway was enacted in October 2025; nothing on the build is held. 2025-08-17 — Parliament passed the Digital Services Bill under certificate of urgency. 2025-10-17 — sections 12 and 22 of the resulting Act require a standardised framework for secure exchange of information and an information gateway. 2025-11-25 — the Tier III data centre was launched, which the government presented as the base for its digital services. No exchange platform, technical specification, participating-agency list or timetable is on the record.	MOVEMENT enacted and not built
Burkina Faso	The interoperability reference framework was adopted by prime-ministerial order in May 2018 and the exchange platform under it was still a funded project rather than an operating layer in December 2023. The rules exist: the reference framework fixes the rules ensuring compatibility between public administrations' information systems. The platform does not yet: the financier's appraisal of December 2023 funds implementation of a national public-data interoperability platform under the digital transition ministry, which establishes it as a project investment still to be built rather than an operating government-wide exchange layer. 2026-05-05 - what did arrive is a front door rather than a back end: version 2.0 of the national public-services portal centralising administrative procedures behind a single interface, carrying 1,672 information sheets, 95 procedures usable online and 183 public institutions. The source does not itself establish interoperability between the systems behind it. No API register, no list of connected systems and no exchange volume is published at any date. 2026-09-02 — the exchange that would matter most is across a border and does not exist: officials of the two states sharing a river proposed a formal reservoir release protocol built on real-time data sharing and pre-agreed spill thresholds, and heard that letters seeking closer coordination sent as far back as October 2025 had gone unanswered. The proposal is a research project's rather than either government's, and nothing is signed.	MOVEMENT
Burundi	The government's own appraisal records fragmented ministry servers and no national data-exchange layer; the 2018 framework decree provides the basis and no platform runs on it. A project appraisal document records fragmented ministry servers with no national data-exchange layer — a statement of absence in the government's own financing document rather than a gap in the record, and the position has not been restated since. The 2018 national data framework decree is the legal basis that would carry such a layer: it defines administrative data, brings it into the dissemination regime and provides for making data available by electronic means. No platform operates on its authority, no data-sharing agreement made under it is held, and the cross-government information-systems concept that would specify one was presented for validation in December 2024 and not adopted.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Cameroon	Forum participants pressed for a national interoperability infrastructure in August 2026; none exists. Participants from government, the private sector and civil society at the 2026 Cameroon Internet Governance Forum, held under the theme of moving from fragmentation to interoperability, pressed for the establishment of a national interoperability infrastructure. It is a stakeholder demand and not a government commitment: no instrument, budget line or implementing agency follows from it on the record. 2026-09-17 — the finance ministry matched the payroll against border-movement data and flagged 5,971 public servants as no longer resident, holding their pay pending justification by 31 October.	NO CHANGE still a demand rather than an instrument
Cape Verde	PDEX is in service as the state data-exchange platform, with four integrations named live. PDEX lets data owners publish their holdings as APIs under conditions they set, with subscription and consumption enforced against those conditions; it names four live integrations — the consular portal, whose civil-identification integration runs entirely through it, the NhaCard platform's traffic with the national health system, the Treasury's DUC collection system, and citizen and company validation APIs already consumed by public and private entities. The platform states that its full API catalogue is still to be published, so the four named integrations are a floor and not a count. The page carries no date. 2026-09-21 — expressions of interest were invited for a 12-month build of a digital-nomad statistics module inside SGIT, interoperable with institutional platforms, under the African Development Bank-financed innovation project.	MOVEMENT
Central African Republic	A national platform is operationally effective at one ministry, with its interoperability architecture still out to tender. 2026-02 - the platform became operationally effective at the planning ministry - data migrated, staff use made mandatory, launch ceremony held, and was launched publicly in late February. One ministry using one platform is the whole of the national exchange the repository holds. The layer beneath it is commissioned and not designed: a US$300,000 technical-assistance contract for interoperability architecture sits in the digital governance project's procurement plan. No second ministry, no exchanged dataset and no service consuming another's data is recorded.	MOVEMENT
Chad	The 2027 budget orientations provide for prohibiting ministry systems incompatible with existing platforms, and accession to a regional digital integration programme is set for a second deployment phase. The budget-framing text is not held and the ministry site was unreachable; the event date is unestablished, and no cost, phasing or implementing agency is named (prohibition). Accession to the regional programme reaches the repository as a single mention in a mission read-out (accession). Prohibiting incompatible systems presupposes a standard to be compatible with, and the digital code that would supply it has no adopted text.	MOVEMENT
Comoros	An interoperability platform was opened to procurement in March 2026 with nothing built, no supplier and no target date. The platform was provided for in the continental bank project approved in October 2024, with nothing built. Contracts were opened under the e-government procurement notice, and still nothing is built, with no supplier, no architecture and no target date on record. A second donor project launched in October 2025 provides for its own interoperability layer, and neither operates. A feasibility study on interfacing the tax system with mobile banking was tendered with expressions of interest due 28 October 2025; no award, study or interface is on record.	MOVEMENT procurement only
Congo	The ministry published a national DPI architecture naming X-Road, MOSIP and Mojaloop. The ministry's statement of the national digital public infrastructure architecture names X-Road for secure federated exchange between the interior, justice, finance, health and higher education ministries with each administration keeping its own data, MOSIP for a unique digital identifier built on existing civil-registry records, and Mojaloop for a national payments switch across MTN MoMo, Airtel Money, the commercial banks and the Treasury under central bank supervision. It is a published architecture and not a deployment: nothing states that any of the three components is in service, and no procurement, timetable or budget for them is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cote d'Ivoire	The interoperability platform is live and populating against targets of 100 services by end-2026, with no count of services actually in production. 2025-09-25 - the platform was launched after a twenty-month build, on a EUR 387,350 contract covering the platform core, five priority services and a transfer of skills, supplied by an Estonian vendor. Its pilot phase covers 12 public bodies, against targets of 100 services online by end-2026 and 700 integrated within three years. The first services were chosen by volunteering rather than by user priority. No source states how many services are actually in production, which is the figure the targets would be read against. 2026-07-29 - a working session with bank information-systems heads advanced an interconnection to transfer loan-application documents electronically for 314,310 civil servants and state agents; no go-live date or cost is stated. 2026-09-17 — the exchange that matters most to credit is measured and found wanting: the finance ministry opened consultative meetings on the quality of the credit bureau's data, putting non-updated contracts at 67.88 per cent against a union average of 46.20 per cent on data as at 10 June 2026, with the country holding 40.96 per cent of the union's active contracts and accounting for 60.17 per cent of its non-updated ones. Three sectoral commissions are to produce a national roadmap (meetings).	MOVEMENT
Djibouti	A prices database and central-administration data-exchange platform was ordered by article 38 of the 2026 budget law, with no design or date. Neither existed at the window's opening. The 2026 budget law orders a prices database and a data-exchange platform on the budget execution directorate, to be established with every central-administration department as the counterpart to a central purchasing body created by the preceding article, with no design, delivery date, budget line or operating rule stated. 2026-07 - real-time identity verification for banks and social protection is named as in preparation by the population directorate, with no date published. Both are ordered or announced rather than built, and the exchange layer the digital agency already runs support on is not stated to be what either would use. 2023-04-30 - a contractor's account records support to the state information-systems agency in setting up a national data exchange layer, following the implementation of an X-Road exchange between registries in 2020-2021; no count of connected registries is held.	MOVEMENT
DR Congo	A data-sharing platform and payment gateway are consultant deliverables, and the decree creating a certification authority has been signed. The platform and gateway are specified on paper only: no architecture, pilot, operator or date, and the interoperability framework is itself a consultant deliverable. The electronic certification authority is named among the instruments to be articulated into the governance framework but is not established, while a July 2026 interministerial order already prices qualified trust services at US$30,000 foreign and US$10,000 local. A fee schedule exists before the institution does. Neither had a position in the repository at the window's opening, so what is stated is where they now stand rather than a direction. 2026-09-28 - the minister said the decree creating the certification authority had been signed by the Prime Minister. No operating date is given.	MOVEMENT a decree creating the certification authority was signed while the exchange platform is still a consultant deliverable
Egypt	The government digital switch connects 105 bodies and links 100 national databases, and a digital treasury of reusable documents began. The repository carries no connection count, architecture statement or lawful basis for the exchange at the window's opening. The switch now has 105 government bodies connected and 100 national databases linked for secure inter-agency exchange, named alongside unified digital identity, the services platform, the digital treasury, digital trust services and the digital post box as the enablers of the transformation. It is ministry-reported through a cabinet readout: no published register of connected bodies, no lawful basis, no audit arrangement and no role for a data-protection regulator is held. The digital treasury's operating model is set and applied to a number of services, its first document an employment registration certificate, with the shop-licensing service the first to reuse verified documents from it, implementing the once-only principle; no list of documents, count of reuses or governing instrument is held. 2026-08-20 - a protocol will integrate the commercial registry and stock exchange databases, giving the exchange direct access to registry data for listed companies, with a joint executive committee overseeing implementation and data confidentiality.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Equatorial Guinea	No interoperability framework exists, and the development agency names limited data-sharing by line ministries as its main obstacle to monitoring delivery. The absence was named by the World Bank diagnostic and no framework, standard or governing body has been published since (diagnostic, priority actions). At the agency's directorship handover on 7 August 2026, its outgoing Inspector General stated the consequence directly: limited sharing by line ministries is what stops it monitoring delivery against the national development strategy (handover).	NO CHANGE
Eritrea	No exchange layer. The systems that exist run separately: customs on its own platform and a vulnerability database in the welfare ministry. Nothing on the repository names a national data exchange, a shared bus or a common identifier convention. What exists is a set of unconnected systems: the customs platform inaugurated in January 2026, which serves officials on an intranet; the welfare ministry's vulnerability database; the tax system under construction; and the health information system. There is one working instance of one system consuming another's output, and it is a legal duty rather than a technical connection: the anti-money-laundering proclamation requires financial institutions to set customer identification policies.	NO CHANGE
Eswatini	Mchumanisi is proposed as the national exchange platform in a draft policy; more than half of ministries still lack meaningful interoperability. The draft data governance policy names Mchumanisi as the platform through which authorised institutions would reach information a citizen supplies once (proposal). The ICT ministry's report to Parliament for 2024/25 records a Government In Your Hand platform soon to launch and the electronic-government interoperability framework under review (report). Where exchange exists it is sectoral: a health information exchange runs a master patient index with deterministic and probabilistic matching, and the revenue service is integrating national databases for data matching. The measure against all of it is the audit finding that more than half of ministries lack meaningful system interoperability. Mchumanisi is a proposal with no specification, procurement or date.	MOVEMENT
Ethiopia	A national data exchange platform was approved by a prime-ministerial board in July 2026, paired with a predictive model and not yet built. The board approved the platform alongside an artificial-intelligence predictive model, at the same meeting that was diagnosing the absence of an interoperability layer (board approval). Nothing is published on architecture, budget, timetable or operator, and the interoperability framework that would govern such a platform has itself been in development since 2024, so approval is the whole of the position.	MOVEMENT
Gabon	The indicator for five government entities exchanging data securely stands at its zero baseline, and the platform itself is unnamed. No value has been published above the zero baseline recorded in December 2024, and no entity is exchanging data on the record (project indicator). The ordinance of September 2025 makes interconnection between administrations compulsory but names no platform and no standard, so the obligation has nothing to run through (the ordinance). 2026-09-08 - the sixth steering committee listed the interoperability platform among four projects under way, with no delivery date and no entity yet exchanging data on the record.	NO CHANGE
Gambia	The register-to-register indicator stands at zero with one link under verification, seven years after the design roadmap. The design roadmap for the social registry was written in 2019, before a national identity system existed to link it to. The implementation report of November 2025 puts interoperability between the social registry, the education system, civil registration and health insurance at zero, with one link being verified. The enterprise architecture that would govern such links was proposed in 2020 and no framework has been published.	STALLED

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	The national data exchange hub is announced and not built, so no shared layer exists for the interoperability the reform strategy assumes. The minister named the hub in July 2026 as something the government plans to establish for standardised and interoperable sharing between institutions, with no design, cost or timetable (hub). What the absence costs is visible elsewhere: a student whose service record does not match the identity card must resolve it on paper, and two digital registers are reconciled by affidavit.	NO CHANGE
Guinea	X-Road is named as the national interoperability platform and described as in progress rather than in production. The Prime Minister was shown the state of the national e-service portal and of X-Road, the national interoperability platform run by ANDE, whose function is to let public information systems communicate so users need not supply the same information repeatedly; he asked that the tools improve traceability and reduce fraud, and announced the forthcoming creation of an interministerial committee on state digitalisation. This is the first located account naming the platform. No decret, arrete or inter-agency protocol establishing it was found, and it is described as in progress, not in production.	MOVEMENT
Guinea-Bissau	Decree 27/2025 sets the rules and consultants delivered the platform design; nothing is recorded exchanging data through it. The interoperability platform sits on the ledger as in development, and both of its preconditions arrived in the window: the national interoperability regulation approved by decree in October 2025 and the delivered interoperability structure, platform and digitisation action plan in November. What the repository does not hold is any system connected to it. The interoperability regulation for public and private digital services is enacted and in force, and no participant is named.	MOVEMENT
Kenya	A health tender makes eight cross-government systems day-one mandatory interfaces, the clearest written interoperability baseline the repository holds. Financial management, central bank interfaces, tax, health insurance, pensions, payroll, laboratory systems and identity management are all mandatory from day one, with primary hosting required in an approved government or health-sector environment (enterprise addendum, laboratory addendum). It is a tender document rather than a national standard, which is the finding: the country's firmest interoperability requirement is a procurement condition on one ministry's system. Separately the Treasury is rolling out a system to consolidate development-partner commitments, disbursements and funded programmes, with launch expected before the end of 2026 and no supplier, cost or statement of whether the consolidated data will be public (Treasury system). An Estonian supplier piloted an interoperability platform for the ICT ministry and the ICT Authority from April 2024 to June 2025, funded through a German development agency, the European Union and the Estonian development centre, against the ten-year Digital Master Plan. A supplier case study is the whole of the record: no government statement, evaluation, connected-agency list or adoption decision after the pilot closed is held. 2026-09-23 - the ICT principal secretary said a unified operations platform linking systems through secure APIs is being built; no budget or date is published.	MOVEMENT
Lesotho	X-Road was presented in February 2026 as one of three systems under development, with no go-live date published. The interoperability platform was presented at a joint ministry and university review of digital public infrastructure progress on 20 February 2026 (review). Once-only information exchange had been named a priority of the year in the memorandum with India signed in July 2025, with no platform then on record (memorandum). No go-live date, connected agency or transaction figure has been published.	MOVEMENT
Liberia	The Government Service Bus carried zero of a target ten systems at September 2025, and its prototype package was re-tendered. The implementation report of November 2025 puts the indicator for government systems exchanging data through the new service bus at zero as at 30 September 2025, against a target of ten by December 2030. The revised procurement plan of 13 February 2026 shows the prototype design and installation consultancy listed twice: the firm-based package cancelled, and an individual-consultant package pending implementation from 25 February 2026. The shared digital infrastructure consultancy at the National Data Center was signed on 6 October 2025.	STALLED

COUNTRY	DEVELOPMENTS	PROGRESS
Libya	LY-NDEX was positioned in July 2026 as the state's data-exchange spine for inter-agency verification, with no connected-entity or transaction figure published. The general information authority and the commercial register office are examining the interconnection of their systems (report). It is an examination; no design, standard or date is stated. The identity authority presented LY-NDEX at an interior ministry workshop concluding on 8 July 2026 as pillar infrastructure for information exchange between agencies, including anti-money-laundering and counter-terrorist-financing compliance (workshop). No legal basis, connected-entity count, service catalogue or transaction volume has been published, so the repository can record the claim made for the exchange but not its operation. 2026-04-23 - the information authority and the Union of Chambers set out at a Tripoli meeting on 20 April 2026 that the union's planned electronic system should follow the national digital government framework and data governance policies and interoperate with the National Data Distributor. No connection date or technical specification is stated.	MOVEMENT
Madagascar	The Rahaka interoperability platform went live in April 2026 across five institutions, built on X-Road and run by the digital governance unit. National interoperability was launched in April 2026, with an online one-stop window announced alongside it; the platform is operational at the investment board, the social-security fund, the statistics institute, the justice ministry and the tax directorate (launch). Expansion of the platform had been put out to tender in August 2025 (tender). No transaction volume, service catalogue or connection roadmap beyond those five bodies is published.	MOVEMENT
Malawi	The national data exchange is in use by two agencies with 25 e-services being onboarded, while the enterprise service bus is still not operating. The exchange was delivered under the foundations project and is in use by the revenue authority and the registration bureau, hosted on locally managed servers, with the immigration department integrating while retaining data ownership; being onboarded is not live, and the repository holds no count of services actually in service (exchange, integration). Nothing on file establishes the service bus operating; its failure to come into service left ministries siloed and denied online passport registration and driver's licence payments, and industry voices were still pressing for all agencies to be onboarded in January 2026 (bus, pressure). Farmers across fourteen districts still use non-interoperable platforms, logging into each separately, and the harmonising framework for agricultural data remains a proposal (agriculture). A second, separately funded system is being built alongside it: two United Nations agencies and the finance ministry's economic planning department are establishing a harmonized national management information system from 2025 to 2027 on European Commission funding. No architecture, host institution or delivery milestone is stated, and nothing reconciles it with the existing exchange or the service bus.	MIXED the data exchange in use by two agencies with a third integrating while the service bus has never operated
Mali	A government intranet had thirteen services integrated at the end of 2025, and a national public key infrastructure was recommended for deployment. The intranet had thirteen services integrated in December 2025, with a draft decree to make government messaging mandatory (intranet). Effective deployment of a national public key infrastructure and electronic signature services was recommended at the national digital week, with no first service named (recommendation). Between them these are an internal network and an intention, not an exchange: no transaction volume, service catalogue or connected-agency count is held.	MOVEMENT
Mauritania	A national data management system is being scoped for inter-administration integration, with blockchain proposed as its trust layer. A two-day workshop on data governance and blockchain in public administration opened on 27 July 2026 (workshop). The system is being scoped on a national blockchain policy in consultation since November 2025, naming land administration, trade, public procurement and natural-resource management as its first domains; no draft text, adoption date or budget is published (scoping). The state digital agency was proposed as national interoperability operator in 2023 (strategy). 2026-09-16 — one sector shows what the exchange is used for: qualification and classification of construction firms now runs exclusively through a government platform linked electronically to the tax administration, the transport administration, the procurement commission, the social security fund and the registry administration. The minister puts the purpose as cutting human intervention and fraud; no file volume or turnaround figure is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritius	The Finance Bill would empower the statistics office to share more data with the finance ministry, alongside new declaration duties on public bodies. The provision was before Parliament in July 2026 and its enacting text is not held (provision). The expanded inter-agency sharing will need solid personal-data safeguards (provision), and the interoperability framework it would run over dates from 2002. Those two facts together are the exchange position of this unit. The data-sharing platform carries 74 inter-agency connections and 253 electronic services, with agencies onboarded in 14 days (leaflet).	MOVEMENT
Morocco	A national water digital twin is designed on a sovereign national data platform hosted domestically, with a first pilot put eighteen to twenty-four months away. The three-layer design rests on a sovereign national data platform hosted in Morocco, fusing sensor networks, satellite observation and data from the basin agencies, the planning commission and engineering consultancies, and is to be hosted in an engineering school's forthcoming scientific tower (design). No cost, budget line or procurement route is given, and the platform it rests on is not otherwise recorded in this repository, so the exchange layer appears here as a requirement of one project rather than as a standing national system. Exchange between administrations also runs by bilateral agreement: in July 2024 the justice ministry and the national police signed a memorandum giving the police updated data from the court case-management systems, with exchange channels, security standards and data-protection terms set in it. No operating record since signature is held.	MOVEMENT
Mozambique	An X-Road interoperability platform is described as under implementation, and a single unified government database is named as an agency responsibility. The platform is named as currently being implemented in a May 2026 tender document, with no operator, go-live date or list of connected agencies on record (platform, tender). A single unified government database is named as a responsibility of the digital transformation agency, with no design, scope, host or timetable published (database). Both are known only through documents about something else, which is the state of the exchange layer here: named in other people's paperwork and never described in its own. 2026-09-28 - the digital agency expects the interoperability platform in the fourth quarter of 2026, and has submitted a shortlist for the mobile digital ID consultancy to the World Bank. 2026-10-09 - the digital transformation agency trained 25 technicians from nine public bodies on the X-Road data-exchange layer, led by Estonian experts.	MOVEMENT
Namibia	The exchange layer has a name and an owner: Nam-X, built on an Estonian platform and run from the Office of the Prime Minister, in service since 2014 with two further services delivered by March 2025. Nam-X was introduced in 2014 by an Estonian technology firm and e-governance academy, connects the databases of different public bodies, and is the customer system of the Office of the Prime Minister's public-service e-government department; capacity-building projects in 2021-22 and 2023 updated the interoperability framework document and onboarded member organisations (platform). A partner project to build two digital services on it ran from June 2024 and closed on 30 March 2025 at a budget of EUR 99,984 (project). The service bus reported in 2020 and the inter-ministry platform named in 2025 are still not established as the same system, and no operating statistic - services carried, agencies connected, exchanges made - is published for any of them (bus, platform). A memorandum between the revenue agency and the business registry commits the two to share information, with an integrated system named only as a long-term goal (memorandum).	NO CHANGE the platform is now named and located and still carries no published operational statement
Niger	A task force was set up in February 2026 to move the identification architecture toward an open-source interoperable solution. A supervision mission held from 3 to 6 February 2026 established an interinstitutional task force coordinated by the information society agency to evolve the identification system's technology architecture toward an open-source, interoperable solution, and aligned the population register with the civil-status system. The legal basis is older: the 2019 electronic transactions law frames electronic transactions, electronic signature and data retention. No operating national data exchange platform is on file, and no interoperability specification has been published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	The national data exchange is moving personal data in production with no lawful basis on record, and practitioners describe the identity layer as federated linkage rather than integration. The exchange was built with European partners to end an eight-siloed-database problem and now moves personal data between agencies in production behind the government service portal; the lawful basis and audit arrangements for that sharing are unstated (exchange, launch). Named practitioners describe the identity number as a federated linkage system with a shared identifier rather than a fully integrated identity system, with banks still reconciling manually and buying third-party verification interfaces; this qualifies a single-source-of-truth framing stated three days earlier and neither source reconciles the two (linkage, fragmentation). A state is building a single patient-data platform connecting records, laboratory results and biological data across facilities, with no legal basis, controller arrangement, consent model or relationship to the national regime stated (health platform).	MOVEMENT
Rwanda	A national data-sharing platform was phased for 2025 to 2026 with no go-live announced, and it is the interoperability gap the country's own analysts name most often. The platform was phased for delivery across 2025 and 2026 and no go-live has been announced (platform, governance). The policy above it is approved and in implementation, and the architecture framework beside it is held as an excerpt. The missing piece is the one that would actually move data between systems, and it is the piece domestic commentary keeps returning to.	NO CHANGE
Sao Tome and Principe	Resolucao 35/2020 mandates an interoperability platform as the structuring layer for public services, and prototypes were reported live in September 2025. The resolution approves the digital governance strategy and creates the digital governance committee, naming an interoperability platform as the structuring layer for integrating and coordinating public services and for recognising and validating multiple citizen identities, alongside an authentication platform on single sign-on and a state certification infrastructure (resolution). A lender mission reported data-exchange, portal, credential and electronic-signature prototypes live with a system integrator engaged (mission). The instrument mandates the platform; it does not record it as built, and no source confirms a production exchange. The framework its interfaces would be specified against is a draft from 2021 (framework).	MOVEMENT
Senegal	An enterprise-architecture account names interoperability as a standing challenge with platforms still siloed sixteen months after launch, and no source records the first phase completing on its end-2025 target. The platform launched in April 2025 with a first phase targeted at end-2025, and no held source records that phase completing (platform, update). Sixteen months on, the government's own enterprise-architecture account names interoperability as a standing challenge and describes platforms as still siloed (architecture). A separate climate-transparency data platform launched in July 2026 on 42 months of external funding, and the ministry names the defect directly: gaps in availability, quality, harmonisation and inter-sectoral sharing (climate, project).	STALLED
Seychelles	There is no national data exchange layer; India committed to building Seychelles' digital public infrastructure in February 2026. The February 2026 joint vision records India undertaking comprehensive efforts on the build-out of Seychelles' digital public infrastructure, including digital payments (vision), with a Digital Transformation memorandum between the two ICT ministries signed the same day (memorandum). Domestically the nearest step is Cabinet's April 2026 approval of a National Addressing System Bill creating a shared reference-data layer described as improving cross-agency access to data (Bill). What exists is a commitment and a reference register. No exchange layer, no registry of connected systems and no transaction volume is held. 2026-09-15 — marine data was given an owner: cabinet approved a hydrographic office inside the maritime safety authority to coordinate hydrographic information across government. No start date or data-sharing arrangement is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sierra Leone	The finance ministry reported piloting a data exchange layer on an open-source exchange platform, above a service bus that reaches the repository only as a prototype terms of reference. The pilot was reported in August 2026 (pilot), and the service bus above it is held as a prototype terms of reference and nothing further (prototype). No connected agency count, go-live date or governing instrument is published. The identity agency's own argument, made at the same consultation, is that identity should come first — which is a position on sequencing rather than a description of what exists. A memorandum signed on 10 May 2024 puts other agencies' identity data in the registration authority's tier III centre and agrees a data exchange layer (memorandum). It is a memorandum, not a legal basis, and the absence of one for inter-register sharing stands.	MOVEMENT
Somalia	The Auditor-General's 2025 audit counted revenue and financial-management systems not integrated with the core system, and the seven systems are not named. The audit report itself is not held; the figures are as reported from it and the systems are not named (audit). Fragmentation inside public financial management, found by the state's own auditor, is the concrete instance of the risk the domestic interoperability analysis warns about in general terms. No remediation plan or response is on record.	NO CHANGE
South Africa	The pilot has infrastructure operational at the national research council with four departments testing it, on a term ending in September 2026. 2025-10-09 — a one-year pilot launched, built on the Estonian data-exchange design: a federated real-time sharing rail rather than a central repository, with four task teams, interoperability standards and draft data-exchange legislation as its deliverables. 2026-01 — pilot infrastructure is operational at the national research council, with home affairs, the social security agency, the student aid scheme and the public service department testing it and a working single-citizen application prototype built. That answers the participating-department question this row previously could not. 2026-07 — nine months in, it was onboarding additional technical capacity to support completion, and the pilot ends in September 2026. No volume of records exchanged is published, and no source states what decision the pilot's end triggers or who takes it.	MOVEMENT
South Sudan	*Not held*, searched 2026-09-06 - a supervision mission records no centralised data management system behind the e-services portal. The mission records the portal existing with limited backend interoperability, no centralised data management system, and a government enterprise architecture and national data exchange and governance strategy still to be developed under the regional digital integration project (mission). The architecture that would define an exchange is at tender, recorded separately. A portal without a layer behind it is a front door onto nothing shared.	NO CHANGE
Sudan	An electronic single window will operate only once all investment-related entities are linked electronically, with no list, sequence or date given, and a central bank electronic application system was directed to completion. The investment authority states the window will operate electronically only once every investment-related entity is linked, and gives no list, sequence or date (window). The national economic management committee directed completion of a central bank electronic application system in August 2026, and no description of the system, its scope, its data or its completion date is given beyond the direction to finish it (system). There is no national data exchange, and both instruments that would need one state the dependency without naming what would satisfy it. 2026-09-03 - the first service the repository holds that names agency-to-agency links went live: a needs-disclosure service on the national platform lets an investor complete the step digitally and wires the industry, transport, agriculture and customs bodies to each other electronically. The links are asserted in the launch announcement; no data-sharing instrument, service volume or processing time is published. An interface gateway is named as a phase-two pathway of the transformation plan (phase two) — the first named candidate for a national exchange layer, with no standards, build or status stated.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tanzania	A government enterprise service bus was named by an external maturity index as the backbone underpinning a top-tier classification, and no held source states how many institutions joined by the deadline. The index named it as the backbone of the classification; the release date is month-precision and no held source states the actual onboarding count (bus, deadline). A separate exchange platform is a distinct build from the service bus and is routinely conflated with it in secondary accounts; the ICT minister said in 2024 the ministry was still coordinating its construction (exchange, systems). Public institutions connected under the digital economy framework are counted to December 2025; that is a network-connection count and must not be read as a service-bus onboarding count (connections).	MIXED a service bus credited with a top-tier maturity classification while no source states how many institutions actually joined
Togo	Three source-code licensing agreements for electronic-government software were signed with a foreign state agency in June 2024, and neither government published its own announcement. They are known only through foreign business press and domestic trade press (agreements). No system name, deployment, value or deliverable follows them. Acquiring source code for government platforms is a substantial sovereignty decision, and the only account of it comes from the press of the two countries involved.	NO CHANGE
Tunisia	A second-phase contract for the national interoperability platform was signed in May 2026. The platform has been in place since 2024 and entered a second phase under contract in May 2026 (phase two, platform). No connected-agency count, transaction volume or governing instrument is published. It is the layer the health identifier, the business register, the social registry and the service portal would all have to cross, and none of those cells can state whether it does. Phase one connected the interior, education, transport and social affairs ministries from February 2024 (launch), with tax-status consultation, death notification and payslip retrieval named as the first exchanges (services). Phase two opened to large-scale deployment to end-2027, inside 192 digital projects for 2026-2030 (phase two).	MOVEMENT
Uganda	The exchange platform connects 37 per cent of agencies against a 73 per cent target and is described as vendor-neutral and real-time; a spatial data store stalled at validation. The authority's own service description puts the platform as a vendor-neutral data integration platform connecting disparate government systems for real-time sharing between ministries, departments and agencies. 2026-06 - the only number attached to it in the window is a target: it connects 37 per cent of ministries, departments and agencies and is to reach 73 per cent by FY2029/30. 2025-08 - a National ICT Infrastructure Spatial Data Store reached a validation workshop, and nothing has been recorded about it in the year since. No transaction volume, uptime figure or list of connected systems has been published for the exchange platform at any date, so its reach is known only as a percentage whose denominator is not stated. 2026-10-01 - the information technology authority said the platform connects the identity register to more than 150 agencies, banks and telecoms operators.	MOVEMENT
Zambia	The government service bus onboarded eight local authorities from June 2026, and a named data-exchange layer is not the component through which the evidenced exchange work runs. Eight local authorities were onboarded from June 2026, and no held source states how a separately named government bus relates to the service bus or to the national portal (bus, statement, finances). A data-exchange layer is named in the acceleration project appraisal as a complementary platform for data integration and exchange; the exchange work that is actually evidenced runs through the service bus, not through a component of that name (layer, appraisal). Distinguishing the named component from the working one is what stops a project document being read as delivery. The bus has a published service count behind it: 290 services were deployed on it by July 2024, alongside a citizens support portal, a public service portal and an electronic know-your-customer system. Driving licence, road tax and vehicle registration applications run through the citizen-facing portal it sits under, where the queues that remain are for collecting licences that have not been printed. No exchange volume across the bus is published. 2026-10-01 - bids for the service bus's redesign were evaluated and under the lender's review at June 2026.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zimbabwe	A whole-of-government enterprise resource planning system was launched as the precondition for clean public-sector data, and open interface standards are a ministerial commitment rather than a published standard. The system was built by a domestic supplier and launched in July 2026; deployment coverage is not stated, and the ministry presents it as the precondition for clean public-sector data (system). Mandated open interface standards for public-sector platforms are committed in the minister's five-point policy compass — a ministerial commitment, not a published standard (standards). Government information technology specification standards reached version 2.0 in May 2025, issued by the Office of the President and Cabinet's technology unit rather than the ICT ministry (specifications, version).	MOVEMENT

Use of digital id in other systems

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The unified national digital identity was carried into sports platforms in August 2026, and the education ministry made electronic civil-status documents compulsory to accept in its schools. The credential is being pushed into services one sector at a time. The unified national digital identity was extended to sports platforms in August 2026, on the national unique identification number established by decree in 2023 and the electronic certification service. The strongest step is compulsion rather than integration: the education ministry reminded schools that electronic civil-status documents must be accepted, which is what it takes to make a digital credential usable in practice. The electronic-identification law gazetted in February 2026 is on the statute book; no text linking the unified credential to it is held. 2026-10-09 - the digitalisation commission set out how the national digital identity is obtained, by registration and appointment at the commune, activation and verification against the holder's biometric data.	MOVEMENT
Angola	The tax authority now serves its compliance certificate to other state bodies, and a US$28 million digital identity platform is under construction. The statutory basis is a decade old: the 2015 civil registration simplification law provides for electronic communication of registration data to the social-assistance, social-security, health and tax services and requires the civil registry to be interconnected with civil identification. Part of it is in place. The tax authority's compliance certificate is served to other state bodies through interoperability, which is the repository's clearest working instance of one register consuming another. And a single digital identity platform valued at US$28 million is being built under the digital acceleration project, with the taxpayer number and unique student identifier as the sectoral keys it would have to reconcile.	MOVEMENT
Benin	The foundational identity was linked to at least 19 national and regional services by February 2025, and the register behind it now runs about 200,000 authentications a day. 2025-03-14 — the foundational identity was linked to at least 19 national or regional public and private services, including microcredit, two safety-net programmes and mobile-money and SIM registration. 2026-02-02 — the register serves more than 80 institutions at about 200,000 authentications a day, with 25m eKYC verifications in 2025. Reuse is the strongest-evidenced part of the identity stack here.	MOVEMENT
Botswana	The identity number is being reused in new systems: the labour market system integrated with it and the health exchange keys on it. 2016 — a diagnostic described reuse of the national identification system across electoral, payroll and transport systems, the fullest account the repository holds. 2026-03-05 — the health exchange's client registry, using the Omang or passport number for unique patient identification, was reported ready for deployment. 2026-03-23 — phase one of the labour market information system went operational with completed integrations to the identification system, the company registry and the government SMS gateway. No count of systems consuming the identifier is published. 2026-09 - the bankers' association launched a national eKYC project verifying bank customers against the citizen database, with no go-live date stated.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burkina Faso	Identification of the subscriber is a mandatory precondition for activating a subscriber card under a decree of 31 December 2018, and a security-service identification platform was approved on 5 February 2026. The telecommunications case is the clearest: a decree of 31 December 2018 makes identification of the subscriber a mandatory precondition for activating a subscriber card, described by the government to the legislature in March 2023, which recommended strengthening it. No enrolment or rejection figure under the regime is published. 2026-02-05 - the council of ministers approved the development-operation record for a platform building on the computerisation and interconnection of five internal-security modules — judicial police, detainee management, civilian arms tracking and a mobile client — to pool identification data among security actors. It is approved and not built: no vendor, cost, timetable or data-protection assessment is held. Underneath both, the unique electronic identifier is stated not to replace other administrative identifiers but to form their common digital base, with mass registration organised through committees run entirely by public structures so that fingerprint and iris data stay sovereign. 2026-10-09 - the digital-transition minister said enrolment for the digital identity, budgeted at over FCFA 40bn, was due to start in October 2026.	MOVEMENT
Burundi	Identity verification was extended across the supervised financial sector and made compulsory for every SIM, in both cases against a document rather than a register. 2026-01-30 — a central bank regulation and its implementing circular on customer identification, identity verification and know-your-customer extended documentary identity verification across the supervised financial sector. It does not make the national identity card the exclusive document and describes no query against a central register. 2026-06 — the regulator required every subscriber to regularise SIM identification against the national identity card, with non-compliant lines deactivated from 25 June. Both are identity being consumed as paper. The payment-infrastructure assessment states the position underneath: national identity cards are presented as documentary evidence at account opening rather than authenticated against a register.	MOVEMENT documentary only
Cameroon	A biometric payroll system had flagged over 53,000 public servants drawing undue benefits by June 2026. The system has been operational since early 2025 and had flagged more than 53,000 public servants drawing undue benefits by June 2026, on the public service minister's statement to parliament, and now runs alongside a separate finance ministry census of more than 950,000 dependent-child birth certificates. Payroll fraud through forged or duplicate birth certificates was unchecked before it. It is the clearest use of identity data by another system on this ledger, and it points back at the civil register: the fraud it detects is a civil-registration failure, and the remedy on file is a manual census of nearly a million certificates rather than a register fix.	MOVEMENT
Cape Verde	The authentication platform reports more than 95,000 users a day and integration by OpenID Connect open to any authorised application. The platform's own account is the first usage figure the repository holds for it: more than 95,000 users a day, offering basic email authentication, identity-card authentication by middleware, card reader and PIN, mobile-key authentication by mobile number, PIN and one-time code, and qualified digital signature; any duly authorised application offering useful services to citizens may use it, a citizen may authenticate with the card at any public administration portal that has joined, and integration is by OpenID Connect with onboarding requested from the state technology operator. Consumption by other systems runs through the state data-exchange platform, which publishes data holdings as APIs under conditions the owner sets and already carries the consular portal's civil-identification integration, health traffic, treasury collection and citizen and company verification. No list of joined applications and no per-service authentication count is published on either side.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Central African Republic	The unique identification number was made mandatory, and a government platform that could carry it is at pilot stage. The legal precondition is in place: the unique identification number was made mandatory, recorded in a financier's completion report of June 2025. What consumes it is harder to find. The biometric electoral register is the largest population database in the country and is not described as keyed to the number. The platform that would join them is at pilot stage, and the national digital identity system is planned. The identity card itself is a source of exclusion rather than access, with extortion and discrimination reported around its issue.	MOVEMENT
Chad	The finance ministry gained a secured channel to the biometric register in March 2026, and an operator queries the identity database. A protocol signed on 10 March 2026 gives the finance ministry a secured channel to consult the national biometric population register for identification, verification and authentication in budget processes (protocol). An agreement with a mobile operator lets it query the national identification number database to simplify subscriber identification, and lets citizens pay document issue and collection fees through the operator's wallet; no signature date, contract value, duration or data-protection condition is stated (agreement). The number is already a condition of access elsewhere: a circular of 26 September 2025 gave school leavers priority in enrolling for one because many could not register at higher-education establishments without it (circular).	MOVEMENT
Comoros	The electoral code admits the biometric identity card as one of two identity documents for voter registration; no other statutory use is on file. The electoral code, promulgated 8 March 2023, computerises and centralises the national voter file at article 7 and recognises the biometric national identity card at article 11 as one of the two admissible identity documents for registration. That is the clearest instrument in the repository putting the card to work in a system other than its own issuance. What it does not establish is an interface. Nothing says the electoral roll queries the identity system, or that a card is verified electronically rather than read; the new passport's data page carries a chip meeting civil-aviation standards and no service reads it. The personal identification number designed as the link between systems is still at framework validation.	NO CHANGE
Congo	Universal health insurance affiliation was set by decree in May 2024, on the identification number the ledger already carries. 2024-05-16 — two decrees set the terms of affiliation to universal health insurance, which is the clearest instance of the identification number being required by another system. No count of services consuming the identifier, and no authentication volume, appears anywhere on this ledger — so the reuse is established in one instrument and unmeasured in practice.	MOVEMENT
Cote d'Ivoire	The social register is to be interconnected with the identity system, and a border post replaced paper processing. 2026-04 - a convention was signed to interconnect the single social register with the national register of natural persons, identifying beneficiaries through the foundational identity system in order to remove duplicates, curb fraud and cut inclusion and exclusion error in targeting. Nothing states how many beneficiaries have been matched since. 2026-07-06 - a border management system at the crossing with Burkina Faso was reviewed with the territorial surveillance directorate and the cyber agency, replacing paper border processing; its deployment date, traveller volumes and data-retention rules are not stated. No legal basis is held for either query route, which is the gap the missing identity statute leaves.	MOVEMENT
Djibouti	Real-time identity verification for banks and social protection is in preparation with no date published. The statutory reach is wide: the identification number is compulsory on property, hospital, school, university, utility and commercial records and for third-party data exchange. 2026-02 - the mobile identity system began offering authentication to partner administrations. 2026-07 - the population directorate names real-time identity verification for banks and social protection as in preparation, with no date published. What is missing is any record of a system actually consuming the identity service. The social registry's own interoperability upgrade with the state information-systems agency is reported as work in progress, not as a connection made.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
DR Congo	A memorandum of 13 August 2026 envisages integrating the national identity platform into a bank's customer-identification journeys, subject to regulation. It is a framework, not a live integration. The platform it would plug into launched on 13 June 2026 on a phased rollout that trains agents before registering citizens, offering authentication, electronic signature, document verification and bank and mobile-money identity as its service set, with no enrolment figure published. 2026-08-13 - the digital economy ministry and a commercial bank signed a memorandum envisaging integration of the identity platform into banking customer-identification and verification journeys, subject to regulation, and covering digital identity and artificial-intelligence integration. It is a cooperation framework with no committed sum and no live integration. Nothing else consumes it. No public service, no operator and no other bank is stated to verify identity against the platform, and the data-sharing platform that would carry such a query is specified on paper only.	MOVEMENT
Egypt	Two services launched in the same week gate access on the national digital identity — family-case enquiry and foster-family services. The public prosecution opened an electronic enquiry service for family-case data and judgments on 1 September 2026, with entry restricted to users verified through the national digital identity so the data reaches only the party concerned (service). The social solidarity ministry launched the first phase of a digital services system for foster families and care institutions two days earlier, wired to other state bodies through the government digital exchange and to the national digital identity for sign-in (launch). Both are single services rather than a general integration, and neither publishes a transaction figure. What they establish is that the identity is now a precondition of reaching one's own record in two ministries. 2026-09-10 - a third service: the prosecution issues five personal-status documents online behind the national digital identity.	MOVEMENT
Equatorial Guinea	A mobile wallet onboards customers on a SIM and a copy of the national identity document, the only recorded downstream use. The identity document is used for enrolment rather than verification: a fuel retailer and a wallet provider onboard customers with just a SIM and a copy of the national identity document. No query service against the register exists, and the interoperability framework that would carry one is still planned. The state operator's approved programme adds biometric know-your-customer checks on its own account rather than against a national register.	MOVEMENT
Eritrea	The identity card is required to open a telephone line - the one documented use of it by another system. With no foundational digital identity system in service, there is no digital credential for another system to consume. What the repository can show is the paper card being used as a precondition: the state operator requires, for a fixed telephone line, a written request with address and contact number, a completed application form, a copy of the identity card and a one-time payment of 882 nakfa. That is a documentary check at a counter, not an authentication against a register, and it runs the wrong way round from what this indicator asks: the card gates access to a service rather than a service verifying against an identity system. It is the only such link the repository holds. The other established dependency is internal to the state: a national identity document is required before an Eritrean passport can be issued.	NO CHANGE a first stated position with no earlier account behind it
Eswatini	A national e-KYC registry is under construction to let banks and ministries verify identity against one record, targeting 500,000 users by 2028. The registry is under construction with a cross-border dimension inside the regional bloc, and the FinTech Strategy targets 500,000 users of it by 2028 (registry, strategy). The health information exchange already matches patients to one identity through a master patient index using deterministic and probabilistic methods, which is the repository's only operating instance of a shared identity across systems. The revenue service is integrating national databases for data matching, with taxpayers segmented four ways. The constraint is the credential: the national identity card does not meet the criteria for digital identification, and the digital identity itself remains planned under the Digital Eswatini project.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Ethiopia	The identity is the authentication layer for the one-stop platform that carries tax services, and was made mandatory for schooling in November 2025. Tax services on the one-stop platform are reached through the national identity (tax integration). The mandate of November 2025 requires the identity for school enrolment and for sitting examinations (education mandate). 2025-01-30 — a farmer profile database built by the agricultural transformation institute is integrated with the national identity and rural land information systems for farmer identification, initially across 311 woredas. None of the integrations is described in technical terms: there is no statement of what is exchanged, under what authority, or whether the exchange runs through a shared layer or point to point.	MOVEMENT
Gabon	Three administrations launched work on 28 April 2026 on a single monthly payroll declaration, making the tax number for employers and the personal identification number for employees obligatory. 2026-04-28 - the tax directorate, the social security fund and the health insurance fund launched work on a single monthly online payroll declaration on a shared form accessible simultaneously by all three, built with a private supplier under the single-window programme. Use of the tax identification number for employers and the personal identification number for employees becomes obligatory, and the scheme rests on employer registration by tax number, employee registration by personal number and compulsory pre-hire declaration, with automated reconciliation of declarations against payments. It is the clearest instance of the identity number being made the join key across administrations, and it is at launch of work rather than in service. The duty behind it is the ordinance's: compulsory interconnection between administrations. What runs on that duty elsewhere is the electoral system, where the number identifies each elector and the roll is drawn from the national biometric file.	MOVEMENT
Gambia	The national identity card went live in June 2026; the civil register link was designed for three years earlier. The project paper of June 2023 sets out interoperability between electronic civil registration and the national identity system alongside a mass-registration drive covering 1.17m people, so the design predates the credential. The credential itself arrived in June 2026, with the President the first recipient and a national identity data centre inaugurated at Abuko hosting it on Gambian soil. The bidding for the system opened in July 2024 on a design-build-transfer basis. No system is yet recorded consuming the identity for authentication.	MOVEMENT
Ghana	Photocopying the card is barred from 2 November 2026 with verification compulsory, while record mismatches are still cured by affidavit. Photocopying the identity card is barred from 2 November 2026, with electronic verification compulsory for institutions relying on it (verification). Where the national service register and the identity register disagree, the citizen still buys the remedy: a sworn affidavit or a Gazette publication. Two correction windows ran inside eight days - one closing 26 August 2026, a second of three days from 1 to 3 September 2026 at the service authority's Kumasi regional office, staffed jointly by the service authority, the identity agency, the state publisher and Commissioners for Oaths (second window, first window). No count of affected students is published, so the scale of the mismatch between the two registers is not held.	MIXED biometric verification becomes compulsory while a mismatch between two registers is still fixed on paper
Guinea	A decree of 22 June 2026 provides for a national platform certifying the identity of telecommunications subscribers — the clearest instrument putting a national identity check inside another sector's system. 2026-06-22 - the decree provides for the deployment and operation of a national platform certifying the identity of subscriber-card holders and users of telecommunications services and products. The regulator's page carries only its title, number and date plus links to two companion decrees of the same day; the articles are not reproduced, so the architecture is not established and in particular it is not stated whether the platform queries the national persons register. The one identity system demonstrably feeding another is at the border: a traveller identification system is in service at the international airport, synchronising traveller data with an international police organisation's systems, a migration agency's data system and a foreign customs targeting system. The register the domestic cases would query is itself still being constituted, fed by an administrative biometric census and serving as the single official source for the electoral file.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea-Bissau	The regional biometric card was issued to more than 260 women traders at the Senegalese border in March 2026. The clearest documented use of the credential is cross-border trade: a pilot handover at the Guinea-Bissau-Senegal border issued regional biometric cards to more than 260 women traders in March 2026. The direction of travel is regional: a consultation opened in February 2026 on a roadmap from national identification systems to the regional card. Domestically the identity number has not been linked to any other register on the record.	MOVEMENT
Kenya	Biometric health identification was extended to dependants aged 7 to 17, each issued a national identifier linked to their health record. It launched at a teaching hospital in August 2025 with 29 biometric devices and is operational in all level four to six public facilities (launch, extension). Enrolling children into a biometric health register against the national identifier is the deepest integration of the identity system in the repository, and no impact assessment, consent model or retention rule for the children's biometrics is on the record.	MOVEMENT
Lesotho	The identity number is used for customer verification by banks, insurers and mobile operators, and a cross-border use is proposed. 2011-03-21 — the founding Act provides for third-party access to the register, the legal basis for other-system use. 2025-11-17 — the financial sector strategy records the identity number in use by the credit bureau, banks, insurers and mobile network operators for customer verification. 2026-02-26 — the 2026 work plan formalises cross-sector identity verification on the open-source platform. 2026-04-22 — use of the identity card as a travel document at the South African border was proposed, with no agreement on the record. No count of systems consuming the identifier, and no authentication volume, is published. 2024-01-30 — the electoral commission said a shared database with Home Affairs, begun earlier and dropped when the ministry withdrew, should be revived so that an identity number brings up a voter's record and deaths leave the roll. No agreement is on file.	MOVEMENT
Liberia	A joint directive of February 2026 binds financial institutions to identity verification for non-resident customers. Directive CBL/FIA/001/2025, signed jointly by the financial intelligence agency and the central bank on 16 February 2026 and effective immediately, requires additional customer due diligence for non-resident, non-Liberian customers, addressing a deficiency named in the 2023 regional mutual evaluation. The general obligation is older: Executive Order 147 requires every public and private institution to verify against the registry. What that dependency costs when the register stops was visible in July 2026, when the Senate summoned the registry over more than six months of suspended card issuance while regulated institutions refused expired cards for banking and mobile money. The tax system was an earlier user: the revenue authority linked its integrated tax administration system to the identity registry to verify national IDs during fiscal year 2023, before the executive order made verification general; no verification volume is published.	MOVEMENT
Libya	LY-DNID is presented together with the national data exchange as the verification layer for anti-money-laundering checks across agencies. At the July 2026 workshop the identity authority set the national digital identity beside LY-NDEX as the pair on which inter-agency verification and compliance checks are to run (workshop). The only sector named as a consumer of it is financial compliance. No ministry, service or agency is listed as connected, and no count of identity verifications performed for another system is published.	MOVEMENT
Madagascar	The national exchange platform launched in April 2026 as the route by which the unique identifier could reach other systems. The civil status law of 2018 mandates a state-issued unique identification number assigned at birth and applicable nationwide (law), and a 2025 law on identification of natural persons cleared constitutional review in August (decision). The first stage of the national interoperability platform, built on X-Road, launched in April 2026, with the December 2025 interoperability decree as its legal basis (launch). What the repository does not hold is any account of which systems now consume the identifier through the platform, or of a live production integration.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Malawi	Offline identity verification authenticated more than 1.2 million farmers under the farm input subsidy programme. The identity system is in live use by systems that are not its own. The urban cash intervention evaluation documents identity records being cross-checked against mobile-money and social-protection beneficiary databases, with match rates quantified. 2026-01 - a real-time integration module between the registration bureau and the social registry had linked 75 per cent of registry households to national identity numbers by September 2025. 2026-07 - an offline digital identity and code-based verification service authenticated more than 1.2 million farmers under the farm input subsidy programme, and took a digital champion award at the information society summit. Offline verification is the design decision that makes the identity usable where the network is not. 2026-09-23 - the regulator urged every ministry and agency to connect its systems to the identity system, officials saying human-resource management, agriculture and health already are. No count of connected systems or data-sharing instrument is published.	MOVEMENT
Mali	The identity number now reaches two other systems: online criminal record and nationality certificates and a parcel identifier keyed to it. The credential is the national identification number established by law in 2006, with its application decree. Two systems consume it. Justice: criminal record and nationality certificates were put online in February 2026, with an electronic justice platform and user training in July. Land: the cadastral identifier established by decree in 2019 keys parcels to the national number, carried into the 2025 domains and cadastre decree. A third is being built inside the state: biometric control of state agents under the human resources system.	MOVEMENT
Mauritania	National diplomas were integrated into the identity application in March 2026, and consular and civil-status services followed. The digital identity application is being used as the front door to other systems, which is what this indicator asks. National diplomas were integrated into it in March 2026, after the education certificate service was put on it in July 2025, and consular and civil-status services for the diaspora were digitised onto it. Two other systems consume the identity credential without going through the application. Telecommunications operators are under pressure to complete biometric subscriber identification, and the tax administration keys to its own identification number. An outage in August 2026 showed what depends on it.	MOVEMENT
Mauritius	The government superapp soft-launched in January 2026 on verifiable credentials in a secure identity wallet. A request for information was issued in September 2025 for a superapp built on verifiable digital credentials in a secure identity wallet (request). It soft-launched as KOREK! in January 2026 (launch). The mobile identity wallet it draws on has been in service since February 2025. What the repository does not hold is a list of the services the credential now opens, or a transaction count through any of them. The identity card number is the taxpayer's login for income tax filing (filing season), keys social security returns to each employee (services), and opens the deeds registry through the national sign-on (registry).	MOVEMENT
Morocco	The police-run trusted third-party verification platform holds seventeen framework agreements with more than thirty authorised institutions, unchanged since 2024. The platform reached its second phase with seventeen framework agreements and more than thirty authorised institutions, and a blueprint to extend verification to all government entities was recorded in May 2025 (platform, annual report). No later agreement count, institution count or verification volume is held, so the reach of the country's identity verification into other systems is recorded as at 2024 and 2025.	NO CHANGE
Mozambique	Biometric identity and access management is being deployed into the national payments switch, having previously run in a single bank. A multi-year deployment agreement was announced in February 2026 taking biometric identity and access management from a single national bank deployment into the national payments network (deployment). The account is the vendor's, with no completion date or participating-bank count. It is the only case in the repository of the country's identity layer reaching into another sector's infrastructure.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Namibia	The population register is operationally integrated with social protection for beneficiary verification, and the first government-to-person payment ran in June 2026. The chief registrar reports the population registration system integrated with social protection for verification of identity and live status, and for identifying and referring undocumented people; over 21,000 San people were assisted under civil registration in 2025 (presentation). The ministry's own earlier annual report documents the electronic birth management system and the population register connected across its offices and border posts (report). The electronic identity pilot at Otjimbingwe was designed to extend digital identity into banking, social grants and online government transactions (pilot). An integrated beneficiary registry is in use and linked to the population register. What is used across systems today is a number and a verification check, not a credential — the electronic identity card itself launches in September 2026.	MOVEMENT
Niger	The Agadez stage of the national tour puts the population register's first phase and its unique identifier still ahead, starting from Niamey. The ministry's August 2026 account reports timely birth registration at 79.8% and about 3,000,000 of 13 million adults still without a biometric identity card, with the legal framework adopted but the register's first phase and eventual unique identifier still to be issued from Niamey. The biometric national identity card was launched in March 2026, its supplier presenting it as groundwork for a forthcoming biometric passport — a second credential rather than use of the first in another system. The repository records no service authenticating a user against the identity system.	NO CHANGE the unique identifier that would carry the credential into other systems is not yet rolled out
Nigeria	Nine agencies took bilateral integration cover under the new identity Act in a fortnight, a telecom identity feed lets banks check SIM swaps, and the number is tied to health insurance records. Nine agencies concluded bilateral commitments across a single fortnight, and the electoral commission's chairman acknowledged the Act as a legal basis for resolving duplicate identities in the voter register; no account states a lawful basis, consent mechanism, retention rule or regulator role for the resulting sharing (agreements, partnerships). A joint feed between the central bank and the communications regulator lets banks check SIM-swap and recycled numbers before clearing, and fraud fell 51 per cent to ₦25.85bn in 2025 (feed). The identity number was tied to health insurance records in October 2025 (health).	MOVEMENT
Rwanda	The 2023 identity law obliges relying parties to integrate, and enrolment reached over 1.8 million submissions by February 2026. Article 30 of the law enacted in June 2023 requires relying-party integration and authentication against the single digital identity (law) — an obligation on other systems rather than an offer to them. Enrolment stood at over 1.8 million submissions against a 15 million target at 22 February 2026, reported to the Senate by the ICT minister (report). Until enrolment covers the population, the obligation binds systems whose users mostly do not yet hold the credential; no count of integrated relying parties is published.	MOVEMENT
Sao Tome and Principe	The registries directorate operates legi non as the machine-to-machine interface to its life-events database, and biometric enrolment kits were tendered in September 2025. The directorate states that the interface is the route by which the root identification of all citizens is to be carried out, allowing electronic validation of paper documents and reliable machine-to-machine exchange between accredited public administration systems through protocols agreed in advance (interface). The page names no system currently consuming it (interface). Enrolment hardware for the national digital identity was tendered under the digital project in September 2025 (tender). The social protection additional financing identifies linkage with emerging digital infrastructure such as digital identity as a synergy to be pursued, which places it as an intention rather than an operating exchange (financing).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Senegal	The government single-window portal authenticates on the national identification number, the credential used as a login key. The portal launched on 24 March 2026 and built by the state digital operator is accessed by authentication on the national identification number carried on the biometric identity card, with criminal record, nationality certificate, prison visit authorisation and public-service non-membership certificates live at launch and civil-status acts and urbanism procedures to follow. The older consumption is the electoral system: the 2016 implementing decree prints the national identification number on the card's reverse, carries the elector's polling details on the same card and at article 2 makes it serve as the voter card. Two more systems consume it: mobile subscriber identification, with unidentified lines terminated from 29 September 2025, and pension proof of life, which requires the card.	MOVEMENT
Seychelles	The digital identity now gates licensing services on monServis and the social protection platform launched in October 2025. The licensing authority's business and vehicle licence services moved to monServis and require SeyID authentication, the former gateway being obsolete (licensing). The social protection agency's platform, launched internally on 15 October 2025, is reached through the SeyID portal that hosts government-entity systems (platform), and in March 2026 Cabinet extended its vendor support and directed the ICT department to lead the transition to government ownership (Cabinet). The wallet also carries a Digital Driving Licence connected live to the licensing authority's own system (wallet). No authentication volume is published. Online tax registration for a company requires the contact person's eleven-digit national identity number and residence in Seychelles (form), which is the clearest instance held of the identity number gating another system.	MOVEMENT
Sierra Leone	Unregistered subscriber cards are being phased out and linked to the national identification number — the credential's first compulsory consumption. The identity number is being made a precondition for a service, which is what this indicator asks. The telecommunications regulator is phasing out unregistered subscriber cards and linking registration to the national identification number, a measure carried into the multi-agency response to cyber fraud in August 2026. Behind it sits the national identification number and biometric system, which the registration authority argues should be the anchor of the whole estate, and a migration of the identity platform onto an open-source stack. Other registers keep their own keys, including the taxpayer register, and the exchange layer that would join them is in development.	MOVEMENT
Somalia	The accountant general's office moved to link the government payroll system with the national identity database (report). The accountant general's office moved to link the government payroll system with the national identity database (report). No date, supplier or coverage is stated, and payroll cleansing is the stated purpose rather than service delivery.	MOVEMENT
South Africa	Biometric verification of grant recipients against the population register reached 997,379 of 19.05m recipients by March 2026, about five per cent. Compulsory for new applications from September 2025, biometric verification against the home affairs register had reached 997,379 of 19.05m recipients by March 2026, against 42,000 in its first two weeks. That is about five per cent of the recipient base after seven months, so the mechanism works and the coverage does not yet mean much. It is also the clearest instance on this ledger of one state system drawing on another's identity data across a whole population, and the repository holds no statement of the legal basis, the error rate or what happens to a recipient the check fails.	MOVEMENT partial
South Sudan	Identity registration is being pushed into other services - school-based registration and an integrated registry memorandum. School-based national identity registration launched in August 2026 (schools), and the immigration directorate's head set out a digital reform programme with a memorandum on an integrated registry (reform). Mobile registration kits were deployed from April 2026 (kits), and the civil registry directorate announced plans to link civil registration to the identity system for real-time birth registration (plans). All of it is registration reaching further, not the identity being consumed by another system. No verification interface, no relying party and no authentication volume is named.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sudan	The national number is checked against the registry when banks open accounts, and the digital identity launched in May 2026 is intended for four sectors. A central bank circular of 2 December 2024 requires banks to record the national number alongside account-opening documents and to check it against the civil registry's own system (circular). That is a live cross-system verification, not a paper credential. The national digital identity was launched on 21 May 2026 by the communications ministry, the cybersecurity authority and the authentication authority in coordination with the civil registry, intended for use across banking, telecommunications, education and healthcare (launch). Banking is the only sector for which the repository holds an actual integration. 2026-09-26 - the first bank went live on the identity link, letting customers update their data through its digital channels without a branch visit; the other banks are to follow one at a time.	MOVEMENT
Tanzania	The identity register's database reaches more than 138 connected institutions — the hardest adoption figure the repository holds for any African identity-verification rail. The count comes from an annual financial-inclusion report (integrations, numbers). It is the hardest adoption figure this repository holds for any African identity-verification rail, which is a claim about the corpus and is stated as one. What it does not establish is query volume, uptime or the lawful basis for any individual integration, and the data protection Act it operates under has no adequacy mechanism for transfers and no duty to notify data subjects.	MOVEMENT
Togo	A December 2024 decree compels telecom operators to collect the unique identification number for every subscriber. The decree, gazetted 23 April 2025, requires the number issued by the identity agency for nationals and residents, admits the agency's card where no other document exists, and obliges operators to retain the data and report to the regulator. It obliges collection of the number, which is not the same as querying the agency's authentication service. The consumption route for the registry itself is the order of 10 September 2024: a convention with the agency in every case, data-protection authorisation for personal data, authenticated and logged access, quarterly reporting. The supervision report held records the data-exchange platform as not in place at 30 September 2024, and nothing later restates it.	MOVEMENT
Tunisia	The business register made the digital identity its mandatory authentication key from 1 July 2026, and the agricultural investment agency did the same. The 2020 interoperability decree-law requires interoperability to identify persons through the citizen unique identifier and enterprise unique identifier registers, and bars bodies from re-asking users for data reachable through the platform. From 1 July 2026 every business register procedure moved online only with the national digital identity as the mandatory authentication key — Mobile ID for natural persons and DigiGO for legal persons — and from 1 September 2026 an electronic safe account keyed to the enterprise unique identifier. The agricultural investment promotion agency made the digital identity mandatory for investment-declaration certificates from the same date. No count of systems that have adopted the credential, and no subscriber figure since March 2025, is held. 2026-09 — an agriculture ministry circular requires every body under it to integrate E-Houwiya into its online services by 15 November 2026, making its identifier the sole reference for new services.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Uganda	Cabinet approved the identity number replacing the taxpayer number, while card holders were turned away from banks and SIM registration because verification failed. 2026-08 - against that, members of parliament reported that holders of newly issued cards were being denied banking and SIM services because the cards' codes would not respond, past the authority's own deadline. 2026-09-07 - the finance minister said the Cabinet decision does not make the identification number the taxpayer number but requires the two to be interoperable - "the NIN and the TIN must be able to read each other", and the revenue authority added that holding an identification number does not by itself make its holder a taxpayer. No instrument, commencement date or migration plan is published. 2026-09-15 — the revenue authority said the TIN will be phased out for individuals. 2026-09-30 - the internal affairs minister launched the integration of the national identification and tax identification systems ; no commencement date is given. 2026-09-30 - the revenue authority set out a two-stage move to the national identification number as the tax identifier, with consent given by fingerprint at a service point.	MIXED the identifier is being extended while its verification fails in the field
Zambia	An input voucher ran electronic know-your-customer across all 116 districts, removing 225,016 ineligible beneficiaries. The Electronic Government Act, 2021 requires public bodies to offer electronic proof of identity issued under the National Registration Act and to enable joint automated procedures and data sharing between public bodies — the legal basis. 2026-01 — the farmer input support voucher reached all 116 districts using electronic know-your-customer verification cross-checked against the pension authority and other registers, removing 212,851 and then a further 12,165 ineligible beneficiaries. That is identity being queried against other registers across the whole country, which is what this indicator asks and what most of the continent cannot show. 2025-09-29 — a digital identity cooperation agreement with Ethiopia was formalised, use-case driven and explicitly linking identity verification to civil registration, social protection and mobile money.	MOVEMENT
Zimbabwe	The national identity number is the search key in the collateral registry, and mobile money operators must validate subscribers against the civil registry from June 2026. The central bank's collateral registry is searchable for individuals by national identification number, or passport for non-nationals, and for institutions by business registration, business partner or licence number (manual). The 2026 monetary policy statement requires mobile money operators to run real-time validation of national identity numbers against the civil registry inside multi-layered know-your-customer frameworks, with biometric matching, a compliance deadline of 30 June 2026, and mandatory deregistration of unverified lines and accounts; the governor said validation is already in place and the bank is working towards full civil registry integration (directive). A 2026 constitutional amendment assigns the registrar-general voter registration and custody of the voters' roll, putting electoral identity under the same authority (amendment). Nothing on the repository reports what happened at the June deadline, and no count of validated accounts is published. 2026-09-10 - the central bank shut down ghost and duplicate wallets after linking the civil registry database with subscriber records, with no count published. 2026-09-14 — the registry was wired into payments: the central bank completed integration of the civil registry with mobile money subscriber records for biometric and identity verification, under a direction to de-register unverified accounts. No count of accounts verified or de-registered is published.	MOVEMENT

Interoperability of health systems

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	A remote patient-record monitoring platform is stated to be in place, and the sector was onboarded to national cloud services. 2025-10 - an electronic patient record was reported, and in December a patient transfer platform. 2025-12-05 - the health sector was onboarded to national cloud services under a convention with the digitalisation commission - the enablement beneath any exchange between health systems. 2026-04-11 - the health minister states a remote patient-record monitoring platform was recently put in place. No facility count, record count or statement that any two of these systems exchange data accompanies any of them.	MOVEMENT
Angola	The health information system moved onto a common platform with the world health body in April 2026, with the vaccination registry on the same stack. Health is the sector where exchange is furthest along, because both systems were put on the same platform. The national health information system was integrated through a partnership with the platform's developers and the world health body in April 2026, and the electronic vaccination registry runs on the same stack. Capture at the edge is being extended to match: municipal and provincial technicians were trained on the electronic surveillance tool during vaccination week in April 2026, with extension to all municipalities planned. What is not published is any exchange between health and the civil registry, despite the 2015 law providing for it.	MOVEMENT
Benin	The laboratory system deployed in Benin added direct transfer to the national health platform, and Benin is one of 18 states working to establish interoperability with a regional health data hub. 2026-03-26 — version 3.6 of the laboratory information system, deployed among 286 laboratories across ten African countries including Benin, added a streamlined export and direct interface transfer to the national health platform. 2026-03-27 — Benin is one of 18 member states that have nominated focal persons to align technical content, finalise data-sharing agreements and establish interoperability with national health data systems. The hub itself is not yet operating, so what moved is Benin's side of the connection.	MOVEMENT
Botswana	The health information exchange's client and facilities registries were reported ready for deployment in March 2026. 2026-01-01 — a case study set out the national eHealth enterprise architecture and its HL7 FHIR interoperability framework, describing a health sector running numerous unconnected systems. 2026-03-05 — the ministry reported the exchange's client and facilities registries ready for deployment and phase one of the electronic medical record rolling out. No go-live date, connected-system list or data-sharing agreement is held.	MOVEMENT
Burkina Faso	Interoperability is a stated objective of the health ministry's own procedures manual rather than a finished state; a community-health data roadmap was co-created in September 2025. The manual defines the national health information system with a central data warehouse as its store and expressly tasks the statistics directorate and other central structures with achieving interoperability between other databases and that warehouse. Naming it as a task is the strongest statement the repository holds. 2025-09 - the health ministry with three partners co-created a national roadmap to integrate community health worker data from rural areas into the warehouse. 2024-2025 - the biennium's health-system work implemented the eleventh revision of the international disease classification in four national referral hospitals, a step toward mortality surveillance and data quality feeding the national system rather than a claim of completed cross-system interoperability. At the collecting end the gap is physical: rural clinics keep paper consultation registers which health workers summarise monthly onto paper forms for district teams to key in.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burundi	Common standards were defined in April 2026 naming HL7 FHIR, and a laboratory system went into nine sites with automated transmission. The health sector digital plan records that the reporting platform, the clinical system and the logistics applications coexist without automatic transfer, that feeding between them is manual, and sets normalisation, a unique identifier, software certification and interoperability as objectives to be built. 2026-04-07 to 10 — a national workshop defined common technical standards, notably HL7 FHIR, priority data-exchange flows and mediation for the fragmented platforms. 2026-05-18 to 29 — a laboratory information system was deployed to nine strategic sites, interconnecting ten diagnostic instruments to a central web platform with automated data transmission, with a national trainer pool formed to replicate across 64 instruments. That is health data actually moving between machines, which the plan of 2019 said did not happen.	MOVEMENT
Cameroon	A pandemic-preparedness project launched in July 2026 includes increasing interoperability of the national health information systems. 2026-07-29 - the project was launched to digitise community surveillance in 42 municipalities, stand up seven regional emergency call centres and increase interoperability of the national health information systems, running 2026 to 2029. Nothing is reported delivered against any of the three. The repository holds no inventory of the health information systems that would be made interoperable, no standard they would meet, and no baseline of how they exchange data now, so the project's interoperability component has nothing measurable behind it yet.	MOVEMENT
Cape Verde	Health information system maturity is scored at 55 per cent with interoperability achieved between the national and regional observatories; a national laboratory system specified to HL7 and FHIR went to procurement in April 2026. The World Health Organization's biennial report is the standing statement: it scores the maturity of the health information system at 55 per cent, records publication of the national digital health strategy for 2024-2034, and reports interoperability achieved between the national and regional health observatories — specific components interoperating while national maturity is partial. 2026-04-28 - the health ministry opened procurement for a national consultancy to design, build and install an interoperable laboratory information system across 20 laboratories, requiring HL7 and FHIR conformance and integration with the aggregated-data platform and the health information system, with the state technology operator named as standing technical partner regardless of the vendor selected. It is a contracting and design step, not a completed rollout. 2026-07 - a cooperation protocol was signed with the health ministry and 30 desktops, 30 monitors and a laptop handed to health delegations and central services for death registration, certification and cause-of-death analysis, the process revised with the health, civil registry and statistics sectors together inside aggregated-data platform modernisation and disease classification implementation, the minister stating a target of over 95 per cent coverage in priority units.	MOVEMENT
Central African Republic	The district health software is deployed across all 35 health districts, with an electronic medical record assigning its own patient identifier. 2026-05 - the district health information software is deployed across all 35 health districts, documented in a community poster accepted for the software's own annual conference. 2026-03 - an electronic medical record deployed with the health ministry and a foundation assigns each patient a unique identification on registration and structures clinical data automatically. That identifier is the record's own, and nothing links it to civil registration or to the national number. 2026-03 - vaccination microplanning was digitised into the district software for one health region.	MOVEMENT
Chad	96.4 per cent of districts enter data directly into DHIS2, and a national data watch centre was inaugurated in June 2026. The health ministry moved from its legacy system to DHIS2 through a 2021 pilot in Moyen-Chari and Batha and a national launch in November 2022, with 96.4 per cent of districts entering data directly into it after the first year (system). A data watch centre was inaugurated in June 2026 under the national digital-health plan for 2025-2030, to consolidate, analyse and visualise health data nationally (centre). In April 2026 the ministry committed to a patient-centred electronic medical record with Rwandan technical assistance, listing integration with existing national systems including DHIS2 among its intended benefits (record). No interoperability specification is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	A formal data-exchange memorandum links the health ministry and the meteorological agency; no other health interface exists. The national digital health strategy for 2022 to 2026 sets institutionalisation of electronic health, facility connectivity and the applications landscape as its scope, describing the health information system as semi-electronic, the platform still being deployed and district health centres rarely connected. It is in its final year with no successor on file. 2026-07 - the platform's country profile records a formal data-exchange memorandum between the health ministry and the civil aviation and meteorology agency as the institutional basis for routine climate and health data exchange, and documents no interface with civil registration, national identity or social protection. 2025-12 - the health insurance platform entered pilot on Moheli as a second health system with no stated link to the first.	MOVEMENT
Congo	The national health policy carries the standing diagnosis of the health information system, and equipment arrived for the electronic logistics system. The national health policy is the standing framework and carries the authoritative diagnosis of the national health information system. 2026-07-18 — computing equipment was delivered for the electronic logistics management information system. The ledger also carries hospital e-health equipment at Oyo. What is absent is any exchange between these systems: no interface, no shared patient identifier and no data-sharing agreement is recorded.	MOVEMENT
Cote d'Ivoire	A 2024 decree made the health-insurance number the single patient identifier in every facility, with twenty-four months to conform. 2024-07-10 - a decree made the universal health insurance registration number the single patient identifier in every public and private health facility, replacing any other number used to open a record, deliver care or reference a patient's health data, with twenty-four months given to bring hospital information systems into conformity. The deadline fell in July 2026 and nothing on file reports compliance, an extension or an enforcement step. 2025-09 - interoperability work between the mobile-health platform and DHIS2 was reported. Before that, outbreak surveillance ran across several separate systems. No inventory of health systems, conformity register or exchange volume is published.	MOVEMENT the conformity deadline the decree set passed in July 2026 with nothing on file reporting compliance
Djibouti	The health information system has recorded limitations, with resources still being sought to revamp it; no exchange with other sectors is evidenced. The health agency's own management response records that the health information system has limitations, including challenges in the use of the reporting platform, and that resources are still being sought to revamp the data system and ensure data connectivity at national level. The one exchange on file is internal: medical records shared between hospitals over the state fibre network at Ali-Sabieh, with no further site reported.	NO CHANGE
DR Congo	Health is where exchange actually happens: an analysis application was integrated directly into the national health data platform and an outbreak tracker was configured within 24 hours in May 2026. 2026-02 - a donor-funded analysis application was built and integrated directly within the national health data platform, letting any user analyse HIV data in granular real time without exporting to a spreadsheet, first adopted as the primary provincial analysis tool in one province with training planned for 112 managers across all 26 provinces. 2026-05 - after an Ebola outbreak was declared, the national implementing partner adapted and made operational a tracker configuration within 24 hours for alert notification, case investigation, laboratory-result management and contact tracing, and a joint standardised surveillance and outbreak-response toolkit was validated with the continental health agency, unifying disease-surveillance data flow across countries. The same outbreak pulled in a source outside the health system entirely: anonymised mobile-phone call records are being used to map population movement and anticipate where the outbreak will spread. That is the repository's clearest instance of cross-sector data reaching a health decision, and it runs through an international non-profit rather than a state exchange layer. 2026-10-02 - the continental health agency said it was deploying the platform for Ebola outbreak data and had sent more than 150 internet devices to affected health zones.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Egypt	The health insurance information system's beneficiary, provider and claims modules are not yet in service. The health data layer under universal health insurance carries 4.5 million electronic health records, a unified electronic medical record and an electronic prescription, and the health cooperation strategy records interoperability with the national identification systems. 2026-01-20 - a supervision report states the procurement module developed and in service, with the beneficiary, provider and claims modules not yet in service - the three an exchange would run over. 2025-12 - a memorandum would automate the healthcare accreditation authority's core operations. 2026-09-14 — a national platform was proposed to connect facilities and integrate patient histories, with AI and telemedicine services, discussed with two named suppliers. Nothing is procured, costed or dated.	MOVEMENT
Equatorial Guinea	The health platform's two-district pilot completed in November 2025, against no unique patient identifier. The baseline is the World Health Organization's assessment: no unique patient identifier and no interoperable health data exchange. The platform arrived in stages — launched at Baney in March 2025 with a ministry data centre and more than 100 digital agents trained, pilot completed in two health districts in November opening a 2026 national rollout. A universal health insurance committee drafted a digitalisation plan tied to the national health information system in May 2026.	MOVEMENT
Eritrea	The health ministry's platform runs offline within its own networks (account); no exchange standard or shared patient identifier is recorded. The health ministry runs DHIS2 offline over its own local area networks, with decentralised data entry at zone and sub-zone level and centralised analysis (account); nothing states that it exchanges data with any system outside the ministry. A nationally owned health-data programme was launched around the 2025 population and health survey, led by the statistics office and the health ministry, intended to produce timely disaggregated evidence accessible to government and partners (case study). A survey programme is not interoperability. Nothing on the repository records a standard adopted, an exchange built or a patient identifier shared between systems.	NO CHANGE
Eswatini	A master patient index feeds a standards-based exchange, and dispensing in the clinical system now updates stock in the logistics system. The master patient index, matching patients deterministically and probabilistically and integrated with the population registry, feeds a standards-based health information exchange (exchange). In-country developers completed training in the first quarter of 2026 producing automated data flows from the clinical system into the district health information platform, aligned to the health interoperability standard (first quarter). A June 2026 workshop validated a live integration under which dispensing a medicine in the clinical system updates stock in the logistics system, implemented so far for antiretroviral medicines (integration). Health is the one sector on this repository where interoperability is running rather than proposed. Legacy systems elsewhere in the sector remain fragmented on the health agency's own account.	MOVEMENT
Ethiopia	Health is the most fragmented sector on the record, at more than 70 siloed platforms and 200 pilots, converging on one record-interoperability pilot. Work on the data governance strategy surfaced health as the most fragmented sector, holding more than 70 siloed platforms and more than 200 pilots, and it is converging on a multi-tenant electronic medical record interoperability pilot (use cases). The pilot has no published scope, participating facilities or date, and the repository holds no health information exchange, no terminology standard and no patient identifier arrangement.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Gabon	Gabon adopted the DHIS2 Tracker in June 2026, the first francophone African country to do so. Gabon adopted the DHIS2 Tracker for longitudinal follow-up of patients with hypertension and diabetes under the non-communicable disease programme with WHO technical support; health establishments enter patient-level information before its integration into the national DHIS2 system — a record-level feed from facility to national platform rather than aggregate reporting. No facility count, patient count or coverage figure for the Tracker is held. 2026-09-04 - the private half of the health system was brought into a standing channel: the ministry instituted quarterly consultations with the association of private health establishments, the agenda naming transmission of health data from private clinics among its items. No data standard, transmission route, reporting obligation or first meeting date is published, and the private sector's share of the national health information system is not held.	MOVEMENT
Gambia	Health insurance is one of the four registers whose interoperability indicator stands at zero. The implementation report names health insurance among the systems the social registry is to connect to, and puts the count of working links at zero with one under verification. What has moved is surveillance capacity rather than data exchange: a workshop in December 2025 trained more than twenty staff on outbreak signal detection and reporting, and an earlier grant funded 140 desktops and civil registration devices — procurement, not systems in production.	NO CHANGE
Ghana	The health information strategic plan diagnosed the absence of interoperability standards; its term ran to 2025 and no successor is held. The sector's own instrument diagnoses the absence of interoperability standards across agency electronic systems, designates the district health information software as the national repository, and sets improving data sharing, dissemination and use as its second objective. Its term ran 2022 to 2025 and no successor appears on this ledger. 2026-08-23 - the health service launched a strategic plan to 2030, a handbook, standard operating procedures and workforce plans for public health emergency operations, with a national roadmap intended to connect health agencies, emergency services, laboratories and animal-health agencies through integrated dashboards and shared situational awareness. No connection is recorded as made under it.	NO CHANGE the sector plan diagnosed the gap and its own term has expired
Guinea	A One Health steering committee signed a four-ministry data-sharing protocol in August 2026, on a health system still at workshop stage. Five health facilities in the Mamou and Dalaba districts now run a hospital information system with interoperability to the national health platform, and the Dalaba prefectural hospital reports consultations up (report). Five facilities is the extent the repository can state. The health, higher education, environment and livestock ministries signed a protocol for shared data, joint epidemiological surveillance and coordinated response to zoonotic and environmental risk; no platform build, data-sharing rule, custodian or protection standard for the shared health and animal data is stated (protocol). The health information system's own interoperability work is a Conakry workshop and a maternity register piloted in 15 centres (workshop).	MOVEMENT
Guinea-Bissau	A track and trace mandate came into force in September 2025 and a US$5m warehouse gives real-time medicine tracking. The pharmaceutical chain is where health data exchange has actually been built: a track and trace mandate centred on the regulator's drug catalogue came into force on 19 September 2025, and a US$5m solar-powered warehouse gives the central procurement body real-time medicine tracking. The national health platform is being extended separately, with a grant placing Guinea-Bissau among seven countries receiving climate and health data tools, and health data use for decisions named among seven priorities in the 2026-2027 cooperation plan.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Kenya	Data exchange regulations designate the shared health registries as critical information infrastructure and make access to them fee-bearing. The designated resources are the national health data dictionary, client registry, facility registry, health worker registry, the health enterprise architecture and the national logistics system (regulations). The Health Cabinet Secretary stated on 4 August 2026 that the charge is 2 per cent of each transaction capped at KSh 5,000, payable to the digital health agency (the charge); the schedule setting the fee is served as a heading with no table under it, so the rate cannot be read from the gazetted text (the charge). A per-transaction fee on access to the national health registries is the repository's only instance of interoperability priced rather than mandated.	NO CHANGE
Lesotho	A consultancy is integrating donor-project systems with the national DHIS2 platform. 2026-04-09 — the World Health Organization records the endorsed national digital health strategy and names digital transformation a priority. 2026-04-01 — a workshop called for interoperability among the identity, civil registration, education and health databases. 2026-06-19 — a consultancy was commissioned to integrate project systems with the national DHIS2 platform. Apart from the patient register's automatic feed into the district system, the integration on the record is of a donor project into the national platform. No health information exchange is held. 2025-11 — the electronic patient register compiles facility-level data and sends it automatically into the district health information system.	MOVEMENT
Liberia	A national sample referral framework was validated in July 2026; the health information system is rated early maturity. A World Health Organization-supported functionality assessment rates the health information system at overall early maturity, with harmonisation and interoperability named as work still to be done; 137 mobile phones and 31 laptops were supplied to strengthen electronic surveillance reporting. In July 2026 the ministry validated a framework linking laboratory sample transport, results reporting and disease surveillance. It was validated, not adopted: the ministry states adoption and implementation remain prospective.	MOVEMENT
Libya	The diabetes authority's system links insulin dispensing to the national number, the first named clinical link to the identity layer. The health information centre runs the national health data platform and hosts health data on a mobile operator's cloud, which is the standing arrangement. Two links were added in the window. The ministry activated an electronic system tracking medicines from pharmacy intake to hospital dispensing in October 2025, and the diabetes authority launched a unified system in May 2026 tying insulin dispensing to the national number.	MOVEMENT
Madagascar	The national health platform gained a financing-platform integration in October 2025 and an individual-record tracking pilot in June 2026. The health information strengthening plan for 2023 to 2027 names the national platform as the reference system with operational integrations for surveillance, vaccination, logistics and case management, while hospital systems remain experimental and interoperability standards, enterprise architecture and unique-identity integration are roadmap targets (plan). A health financing and insurance platform announced interoperability with the national system in October 2025, with the ministry's information directorate supporting (announcement). A tracker pilot for individual vaccination records opened in June 2026 across 20 public health centres and 54 private vaccination sites in one district (pilot).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Malawi	A project integrating climate, health and surveillance data with the world health body's early-warning system launched in February 2026. The governing instrument is the ministry's own digital health governance framework, which names the health information system as the flagship platform and mandates its integration with the national registration system. 2026-02 - a health ministry project began integrating climate data, the health management information system and the one-health surveillance platform with the world health body's early-warning system across four districts. 2026-04 - the community health information system's non-communicable disease screening module neared integration with the facility-level electronic medical record system, which is community-to-facility rather than sector-to-sector. The framework's mandated link to the identity system is not evidenced as built.	MOVEMENT
Mali	The national health information system publishes its own description, and community health workers notify perinatal deaths and births electronically in four districts. The system runs under a health and social information strategic plan for 2020-2024, whose period has expired, and a national digital health plan for 2024-2028 (system, plan). A health organisation set out the case for an integrated and efficient health information layer in September 2025 (case), which is a statement that integration is not yet there. No completeness rate, reporting timeliness figure or facility count is published for the system.	MOVEMENT
Mauritania	An electronic consultation register reached two eastern regions in July 2026, with a health data platform under construction. Health information here is being rebuilt from the consultation upward. An electronic consultation register was extended to the two eastern regions in July 2026, the national digital health programme selected its pilot sites in April, and a digital health data platform is being built with a financier. The system it replaces is the regional health information system constituted by a 2021 order for data collection, which the health minister described to the assembly in January 2026. No exchange between health and any register outside health is described.	MOVEMENT
Mauritius	The e-Health programme targets full public-sector coverage by end-2027, thirteen years after it started. The ministry reported on its performance for 2024-2025 (report). An account of July 2026 puts full public-sector coverage at the end of 2027, thirteen years into the programme (account). A modernised public health bill was put to a stakeholder workshop in May 2026 (workshop). The 2027 target is the programme's own, and no coverage figure against it is published.	MOVEMENT
Morocco	The national health-data platform is in service and under a security and performance audit running from July to September 2026. The audit covers infrastructure, application, database and cybersecurity, on a budget of 170,000 dirhams under a donor grant, with no cyberattack or breach cited as the trigger (audit). The budget and scope are the reporting outlet's account of the audit terms and no findings are published, so the repository records that the platform exists and is being examined, and nothing about what it connects. A national framework is being built beside it: the MOHIM lab of a Mohammed V University e-health centre, working with the health ministry and IHE Catalyst since GITEX Africa 2025, is developing CI-SIS Morocco and plans a Pan-African Connectathon in Morocco in October 2026, on its own account.	MOVEMENT
Mozambique	Birth notifications pass from hospitals into the civil register in real time, and laboratory results now reach clinicians without printing or re-keying. Electronic birth notifications pass in real time from the hospital birth module into the electronic civil registration system over an interoperability layer, launched on 22 July 2024 after an April-May 2024 pilot in Inhambane province, where the facilities using the birth module grew from five to nineteen and over 11,589 newborns were registered digitally (integration, launch). Viral load results generated in the laboratory information system now reach clinicians through the electronic patient tracking system without printing or one-by-one re-keying, which was the previous route (results). Both are reported by implementing partners. Nationwide expansion of birth notification is stated as a plan with no date, no figure later than 2024 is held for it, and no coverage, turnaround-time or error-rate figure is published for the laboratory link.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Namibia	A ten-year digital health policy launched in February 2026, and the health minister concedes health and civil registration systems have operated in silos. The ministry launched the National Digital Health Policy for 2026 to 2036 in February 2026 as a ten-year framework, alongside an invitation to procure an electronic health system (launch). The minister states that health and civil registration systems have often operated in silos and that paper-based records and uneven access remain major barriers (fragmentation), which is the position the 2021 e-health strategy set out to change (strategy). A digital community system is replacing paper-based community-health records with an offline-capable tool, with officers trained in July 2026 (training). The e-health network reaches every hospital and 23 health centres, and cause-of-death certification stood at 70 per cent in 2024/25 (budget speech).	MOVEMENT
Niger	A national health interoperability layer entered production in 2026, exchanging data automatically with the national health information system. The layer reported in August 2026 exchanges data automatically between three digital health platforms and the national health information system, described as the first concrete integration step against the 32 or more largely siloed platforms the country held in 2023. At a validation workshop in July 2026 the e-health directorate presented the layer as already operational with several systems, the disease-surveillance platform's data now transferred automatically rather than re-entered each week. How many of the remaining platforms are connected is not stated, and no published interoperability standard or data-exchange specification is on file.	MOVEMENT
Nigeria	A coordinating office was created in June 2026 to operationalise the national digital health architecture across public and private institutions. The President approved the National Health Technology and Data Analytics Office on 26 June 2026 and appointed a national coordinator, charged with operationalising the digital health architecture across public and private institutions. That architecture was endorsed for nationwide implementation by the National Council on Health in November 2025 and described as the sector's common rules of the road, covering a health information and claims exchange and national registries. The last count remains the minister's own: 7.2 million people on the exchange and more than 200 hospitals integrated. No independent count, facility list or published integration standard is held. 2026-09-16 — the health ministry inaugurated the steering committee of a new office to coordinate and integrate health technology and data systems, charged with implementing the national digital health architecture, now held in full. 2026-09-25 - the private providers' association launched a platform to link providers, insurers, regulators and patients in a central repository, starting in Lagos; no connection to the national exchange is described. 2026-09-30 - the disease control centre signed a memorandum to pilot automated disease reporting from private facilities into its surveillance system.	MOVEMENT
Rwanda	An event-based surveillance system integrates laboratory and indicator-based surveillance in near-real time within the health intelligence centre. The centre launched in April 2025 integrates community health worker, health post and health centre data feeds (launch). The surveillance system documented in April 2026 integrates laboratory information systems and indicator-based surveillance in near-real time (account). The electronic medical record feeding both had reached the majority of public health facilities by April 2026 (presentation). What the repository does not hold is any statement of the standards these systems exchange on.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sao Tome and Principe	The national health information system runs on an open-source platform launched in December 2019, and was put out for independent evaluation in April 2026 alongside two other health systems. The health ministry's own page records the platform's official launch on 18 December 2019 and a tracker module launch in October 2020, allowing digital forms and indicators, national-level storage, report generation and visualisation (platform). It does not state that the system exchanges data with any other government system. The health cooperation strategy records that non-communicable disease indicators were added and that use of the platform had to be optimised in the short term to meet the urgent need for reliable health data (strategy). A one-month independent evaluation was commissioned in April 2026 covering the platform, the supply system and a facilities system by name (evaluation). Three named health systems and no stated interface between them or with anything else.	MOVEMENT
Senegal	A convention commits the state digital agency and the health-cover platform to interconnect, with no enrolment target, go-live date or named data-sharing instrument. The convention was announced in July 2026 committing the two bodies to interconnect their platforms (convention, partnership). No enrolment target, go-live date or named data-sharing instrument accompanies it, and the personal-data commitment is an intention rather than something referred to the regulator. The ministry has meanwhile begun building a single patient record ahead of the law meant to govern its confidentiality and transfer, so health data is being joined up in two places at once with no instrument governing either.	MOVEMENT
Seychelles	Health data capture is primarily paper-based with the electronic system stalled; a July 2026 reform makes digital health a pillar. The National Health Strategic Plan 2022-2026 records that data capture is primarily paper-based, that implementation of an electronic health information system begun in 2020 had stalled, and that no formal data-governance standards existed (plan); the ministry's own 2022 annual report puts the start in late 2021 with slow progress through 2022 (report). The reform programme launched on 21 July 2026 makes digital health and data-driven decisions one of seven strategic pillars (reform), and Cabinet approved repeal of the Health Care Agency in February 2026, folding its functions and records into the ministry (repeal). No interoperability specification, standard or exchange with any other system is stated. The health ministry launched a continental-agency-funded assessment of health information exchange maturity on 21 July 2025 (workshop). No findings are published.	MOVEMENT
Sierra Leone	A Health Information Hub launched in January 2026, under a digital health roadmap whose own window closes at the end of the year. The ministry launched the hub on 20 January 2026 as a national health information system (hub). The roadmap running 2024 to 2026 sets strategic objectives over leadership and governance, strategy and investment, and services and applications (roadmap), and a National Health Compact was agreed in December 2025 (compact). What is not held is the interoperability itself: no list of systems the hub connects, no standard it exchanges on, and no successor to a roadmap that expires this year. 2026-09-17 to 18 - a convergence workshop on a shared health digital public infrastructure mapped the digital health estate for gaps and duplication, discussed costing and funding, and planned a technical working group to validate an implementation plan. No plan text, cost or date is published.	MOVEMENT
Somalia	A national primary-care electronic record reached 111 facilities and lifted reporting completeness from 85 to 96 per cent; a second system scaled to over 40. The record deployed between 2023 and 2025 across 111 facilities in six states is aligned to the national platform's interoperability and indicator standards, so routine clinical data generates compliant aggregate reports automatically; reporting completeness rose from 85 to 96 per cent (account). A second digitalised data system scaled from a five-facility pilot in mid-2024 to over 40 facilities across nine regions and more than 25 districts, pushing frontline clinical data into the federal platform in real time (account). The standing assessment against which both read found no electronic medical records system at all (assessment).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
South Africa	The health interoperability architecture remains the gazetted 2021 normative standards framework, with no implementation measurement held and the Act it underpins before the Constitutional Court. The architecture is defined inside a gazetted 2021 normative standards framework for interoperability in digital health rather than in a document of its own: a federated hybrid of local and shared infrastructure, with central patient, provider and facility registries, shared clinical repositories and a national health information exchange, built on the international profile and messaging standards. It superseded the 2014 framework and states that semantic interoperability remains an ongoing undertaking with value sets to be published in due time. Nothing in the window measures what it delivered. The insurance scheme it underpins is in its second phase to 2028, its Act is under constitutional challenge with judgment reserved since May, and the national patient registration system is still being built.	NO CHANGE
South Sudan	An electronic logistics system reached 105 of 145 health facilities with its dashboard integrated into the national health instance. The national health management information system has run on DHIS2 since 2020, with integration of health-programme data into it recorded as in progress and only 22.4 per cent of health facilities holding comprehensive facility-wide electronic systems (assessment). The electronic logistics management system reached 105 of 145 facilities with a dashboard integrated into that instance (integration), and a custom dashboard began piloting climate-informed predictive modelling inside it in July 2026 (dashboard). Two applications integrated into one national instance is real interoperability, and it is confined to health.	MOVEMENT
Sudan	Health reporting coverage rose from 13 to over 56 per cent by end-2025, while interoperability specifications remain undefined. The health ministry declared 2026 the year of full digital transformation, reporting coverage up from 13 per cent at the onset of the crisis to over 56 per cent by the end of 2025, and calling for full expansion of the routine reporting platform to link all facilities and coordinate with the civil registry and the statistics bureau (declaration). The standing assessment records the platform deployed since 2016 under a health management information system established in 2013, and finds technical interoperability specifications between one health information system and the next undefined (assessment). Three new tools launched in September 2025 for rollout to over 400 facilities (launch).	MOVEMENT
Tanzania	More than 45 health systems are linked and about 220 facilities exchange data, against more than 180 standalone applications. The 2024 sector performance report records the health information exchange and its mediator alongside more than 180 standalone applications, private electronic medical records largely unable to submit to the national platform, and a universal health application-programming-interface guideline still in development. In October 2025 a permanent secretary announced an integrated electronic medical record linking patient data from community level through district hospitals to national level for the first time. By May 2026 the minister reported more than 45 digital health systems linked through the national interoperability platform, with about 220 facilities exchanging data digitally. No denominator of facilities is given against the 220, so how far that reaches is not established. 2026-09-09 - the health permanent secretary said the number of health systems is being cut, private and public systems linked, and a national Health Data Centre prepared as one access point for research. No access rules beyond user role are published.	MOVEMENT
Togo	The health platform now ingests global climate data shared with the meteorological agency; the insurance systems agreed a federated architecture. The country profile records the climate application installed in the national health information system and malaria repository, global reanalysis datasets ingested and shared with the meteorological agency, and gridded temperature, rainfall and humidity served at district level. The exchange is institutional as well as technical: the meteorological agency has signed a memorandum with the health ministry, and a monthly climate and health bulletin is published. A workshop of 4 to 7 May 2026 settled a federated architecture for the unified health-insurance system, naming unique patient identification as a precondition. A framework convention of 14 October 2025 set structured data sharing between the two public managers and three private complementary-cover bodies.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tunisia	A national portal is in final configuration on the health identifier, over a system the World Bank found largely paper-based. The World Bank's April 2025 project document records a health system still largely paper-based: the computerised medical record pilot faces connectivity and functionality problems, is fully installed in 50 per cent of university hospitals and 32 per cent of regional hospitals and absent from district hospitals and basic health centres, there is no unified chronic-disease registry, and the emergency service runs on paper reports that do not integrate with hospital records. Parliament approved by 94 votes to 2 with 3 abstentions the second amendment to the 2019 development-agency loan financing the e-health programme, EUR 27.3 million across 24 university hospitals and five regional telemedicine initiatives, with drawdown extended to 30 September 2028 and only about 16 per cent drawn. The Sahetna portal is in final technical configuration on the generalised national health identifier, with a shared unified record to move clinical data between emergency departments and operating theatres and joint commissions to extend both to private clinics and laboratories. 2026-10-07 - the Sahloul university hospital reported 180,000 health identifiers unified under the national health identifier, first among public hospitals.	MIXED the identifier and the portal advanced while the record layer under them stayed largely paper
Uganda	The 2023 exchange and interoperability guidelines govern, and US$100m of donor-built systems including the exchange platform passed to the ministry in March 2026. The governing instrument is the health ministry's own Health Information Exchange and Interoperability Guidelines of January 2023, which define the exchange architecture. No conformance or connected-system count against them is published. 2026-02 - the national laboratory data repository was launched, linking laboratory information systems to the national health data warehouse. 2026-04 - ownership changed hands: digital health systems valued at US$100m were transferred from a university programme to the ministry on 31 March 2026, among them the health information exchange platform, the electronic medical records repositories and the surveillance trackers, against a record of 1,300 facilities running case-based surveillance. The valuation is the university's own rather than a transaction price, and no ministry running-cost or staffing plan for the transferred systems is published - which is the risk a handover of this size carries and the repository cannot yet speak to.	MOVEMENT
Zambia	The health ministry published a national HL7 FHIR implementation guide defining profiles across five named systems. The health ministry published its own national HL7 FHIR R5 interoperability specification, defining reusable profiles for exchanging data among the clinical system, the health management information system, the master facility list, the electronic logistics system and the human resources information system, superseding the earlier strategy's draft framework. A published implementation guide naming the systems it connects is a stronger artefact than an interoperability policy, and it is unusual: most of the continent's health interoperability positions on this frame are workshops. What is not yet held is any statement of conformance — no system is recorded as implementing the guide.	MOVEMENT
Zimbabwe	A health information exchange has a core implementation guide held as a continuous-build draft marked for demonstration and practice purposes only. The guide is the health ministry's own continuous build at version 0.1.0, marked "content is for demonstration and practice purposes only"; the underlying exchange is reported by the financing partner rather than by the ministry (guide, case study). A published interoperability specification carrying its own disclaimer that it is not for production use is a precise statement of where health interoperability stands here.	MOVEMENT

Interoperability of education systems

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	A January 2026 decree added distance and digital learning to the continuing-education university's mandate, beside four higher-education platforms. Education systems here are numerous and separately built. The higher-education ministry runs four digital platforms under its digital programme, school education is being digitised under a 2026 order on computing and educational technology in secondary schools, and an administration study covers primary schools. The window's instrument extends the mandate rather than joining the systems: a decree of January 2026 adds distance and digital learning missions — open courses, digitised content, open pedagogical resources and digital training of trainers — to the continuing-education university. No learner identifier or exchange between the platforms is described.	MOVEMENT
Angola	A unique student identifier was created by decree in November 2025, and a national education database was named in August 2026. Education acquired the two prerequisites for exchange, in order. The presidential decree of November 2025 on school records created a unique student identifier, which is the key. The national education database was named and described in August 2026, which is the store, and the higher-education system trained focal points across institutions in September 2025. Exchange with the registry side is being forced by a practical problem rather than designed: a ministry circular of August 2026 allows enrolment of children without identity documents, which is what a school system does when it cannot yet query the register.	MOVEMENT
Benin	The examinations office moved diploma, certificate and transcript requests onto an online platform, and the education council recommended integrating special-needs and female-enrolment data into the national platform. 2025-09-26 — the examinations office moved diploma, certificate, transcript and authentication requests onto an online platform, so records can be requested from Benin or abroad without an in-person visit. 2026-07-21 — the national education council adopted a recommendation to integrate reliable data on learners with special needs into the national education platform and to record female enrolment exhaustively. One is delivered and one is a recommendation, which is the distance still to run.	MOVEMENT
Botswana	The credit accumulation and transfer policy took effect in November 2025, the only cross-provider education-data instrument held. 2025-11-27 — the qualifications authority's policy on credit accumulation and transfer took effect, setting the terms on which learner credit moves between education and training providers. 2026-03-23 — phase one of the labour market information system went operational with a completed education information subsystem, and a second phase funded at P8m. The repository holds nothing on a schools-level education management information system, and no technical interoperability standard between education systems.	MOVEMENT
Burkina Faso	The unique student identifier platform is a two-province pilot rather than a completed national interoperability layer, with progressive enrolment due from the 2025-26 school year. The platform enrols pupils, handles transfers and end-of-year decisions and tracks learners across public and private schools, presented as a two-province pilot rather than a completed nationwide education-data interoperability platform. Work on school identity cards and online enrolment was under review in June 2025 with support from the regional identity programme. 2025-04 - a financier's appraisal authorises a centralised digital student-management platform and a centralised education-data platform as separate subcomponents — two platforms whose relationship to each other is not stated. 2025-06 - a regional working group meeting in Ouagadougou reviewed a year of work on strengthening sub-national education-data collection and integrating promising sub-national tools into national frameworks, stressing that interoperable data flow from schools to national systems is what avoids fragmentation and duplication. Fragmentation is named as the risk; nothing states it has been avoided.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burundi	Ministry cadres were trained in database administration and the system was assessed against continental norms, from a paper-collection baseline. An independent assessment describes the education system's data chain as paper collection at the school followed by electronic entry at central level, published through the statistical yearbooks, with limits on integration and reliability of the databases. 2026-06 — cadres of the education ministry were trained in database administration as part of modernising the management information system, and Burundi self-assessed the system against the continental EMIS norms and standards at a three-day technical workshop, the most directly interoperability-facing education movement in the window. What neither states is a connection to anything outside education: no link to civil registration, to the identity register or to any other sectoral system is on the record.	MOVEMENT
Cameroon	An integrated sectoral education management information platform was launched on 13 May 2025 with no coverage or data-flow detail published. 2025-05-13 - the education agency of the United Nations, the government and a financier officially launched an integrated sectoral platform for the education management information system together with its methodological tools. The launch notice carries no coverage, participating-ministry or data-flow detail, so what the repository holds is that an integrated platform exists and not what it integrates. The work under it is being bought separately: EUR 8m of technical assistance over 36 months covers the education management information system, the basic-education ministry's mapping platform, interconnection of the education databases and dynamic reporting. The examinations leg is being wired to a different place again: three pillars agreed — site interconnection, examination data in the sovereign national cloud, and examination-management platforms, with nothing reported live.	MOVEMENT
Central African Republic	The education management and human-resources systems are financed under a successor project; no exchange between them is held. The education management and human-resources information systems are carried as a component of a project approved in June 2024 and effective that December, with operational start-up recorded in March 2025 and their standing set out in a closed project's completion report. Nothing records the two exchanging data with each other, with civil registration or with the identity system, and the country has no interoperability architecture yet - it is out to tender.	NO CHANGE a first stated position with no earlier account behind it
Chad	The education compact records no interconnection across ministry databases; decentralisation now covers 16 provinces. The ministry's own compact states that the education information system functions and publishes an annual statistical yearbook but is weakly decentralised and donor-dependent, that teacher headcounts differ between it and the budget, and that interconnection of ministry databases remains to be done (compact). Decentralisation is now effective in 16 provinces across 12,863 primary schools and is to be extended to seven more, with data still analysed centrally (decentralisation). About 550,000 dollars of computing equipment — 8 servers, 168 all-in-ones, 115 laptops, 21 tablets and storage — was handed to seven provincial delegations and four central directorates on 15 June 2026 (equipment).	MOVEMENT
Comoros	The digital report card became the only document accepted for university enrolment, a school record crossing into higher education. 2025-11 - the education ministry described the platform as carrying a unique pupil identification number and real-time statistics across establishments, put forward against enrolment data that differed between inspections and regions. A single pupil identifier is the precondition for any exchange, and it is now issued. 2026-02 - the ministry made the digital report card the sole document accepted for enrolment at the University of the Comoros and the other higher-education institutions, with every public secondary school integrated and 45 per cent of public primaries. That is one system's output becoming another's admissible input. Nothing on file describes an interface between them: the higher-education institutions accept a document, not a query.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Congo	Budgeting and control arrangements for the education transformation programme were set by order in April 2026, on the education information system the ledger carries. 2026-05-14 — orders set the budgeting, execution and control arrangements for the education sector transformation programme's results component. The standing system is the education information and management system. No exchange between it and any other government system — identity, social protection or health — is recorded.	MOVEMENT
Djibouti	The ministry made consolidating its two education platforms into one sector information system a stated priority for 2025-26. 2025-09-02 - the start-of-year circular makes consolidation of the education information system through the two platforms a strategic priority, aimed at reliable regularly updated data, identifying at-risk pupils and evidence-based decisions. 2025-11-20 - the education minister reports the system in operational use, with more than 3,000 at-risk pupils identified and supported through it. The consolidation is inside the sector. No exchange between education and civil registration, social protection or health appears anywhere in the record, and no interface or data-sharing agreement is published.	MOVEMENT
DR Congo	The education system was assessed against continental norms and standards over three days in May 2026, with gaps identified and a national roadmap still to be defined. 2026-05-12 - a workshop under the continental education institute ran a self-assessment of the education management information system against continental norms and standards, establishing that the system exists and was still being measured against them, with gaps being identified and a national roadmap still to be defined. The national health data platform was being explored as a possible platform for education-data interoperability and is not adopted. Underneath the assessment there is a working collector: the national school-data application was used for the 2022/23 school census across ten project provinces, and a three-week digital enrolment pilot across 20 primary schools in April 2026 registered 8,634 students. Collection is not exchange. No flow between the education system and any other government system is evidenced, and no standard has been adopted for one.	MOVEMENT
Egypt	A unified pre-university education dataset complies with the statistics agency's requirements; no other exchange is held. 2025-12-15 - the first unified national infrastructure for pre-university education data was launched, complying with the statistics agency's requirements. That compliance is the one education-system exchange the repository holds, and it runs to the statistical system rather than between education systems. 2026-04-01 - the communications and higher education ministries set out a digital transformation agenda including issuing digital graduation certificates through the national platform - an exchange in prospect, with no certificate volume or start date.	NO CHANGE a first stated position with no earlier account behind it
Equatorial Guinea	SICOLO, the first digital education portal, launched in July 2026 with enrolment, results and a graduate directory. The education system's data has been a yearbook rather than a service: the ministry's statistical yearbooks name the management information system and describe no learner identifier, exam or payroll linkage. The portal launched in July 2026 is the first citizen-facing layer over it, carrying enrolment, results and a graduate directory. Whether it draws on the same records as the yearbooks, or on a register of its own, is not stated.	MOVEMENT
Eritrea	The ministry rates its teacher management information systems weak and sent a delegation to learn the practice (workshop). An education ministry delegation attended a regional competency enhancement workshop in Lusaka in June 2025, reported in December, to learn teacher management information system practice (workshop). The education sector reform compact of September 2023 used analysis of the education management information system database to identify the barriers it addresses (compact). Both systems are described in planning documents and neither is shown exchanging data with anything else; the ministry itself rates the teacher system weak.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eswatini	The education management information system is keyed to a personal identification number and stated by government to allow linkage with other systems. Government's own performance report records the system launched as a real-time platform keyed to a personal identification number and allowing linkages with other management information systems (report). Disability indicators were integrated into it in November 2025 with more than 900 staff trained, and the stated next priority is connecting it to other disability-tracking systems (integration). The finance minister's 2026 budget speech names it as a benchmark for education data management (budget speech). No actual linkage to another government system is recorded as operating, and most rural primary schools still collect on paper.	MOVEMENT
Ethiopia	Refugee schools are being integrated into the national education information system under a funded package (programme paper). A US$69m additional financing package approved in March 2026 integrates all 57 refugee primary schools into the national education system, including full integration of refugee learners into the national education information system, with US$750,000 earmarked for enhancement and disaggregated reporting (programme paper). The adoption of DHIS2 for Education in November 2025 was framed explicitly as operationalising the ministry's national education information system at local levels so that local data can be used where it is collected (launch). Both are integrations into one sector's system. The repository holds nothing on education data exchanging with the national data exchange platform, the civil register or the digital identity.	MOVEMENT
Gabon	The 2011 statute gives every learner a unique number from pre-primary, kept until working life; an application now assigns identifiers to establishments and pupils. The founding act is fifteen years old: from entry into the first pre-primary section every learner receives a unique identification number, coded and assigned by the education ministry's central file and kept until entry into working life, and that central file is the basis for the orientation list for new baccalaureate holders. It specifies no exchange standard between systems. 2026-03 - the orientation secretariat deployed an application assigning a unique identifier to every public and private establishment, building a national mapping against a stated inability to count them, and a unique number to each pupil tracking the school career from pre-primary to end of studies — a working system for the statutory identifier, fourteen years on. 2026-06-27 - primary certificate results were published online through a separate platform, letting candidates consult them instead of at school noticeboards. The account says nothing about that platform exchanging data with the school census, the learner identifier or higher education, so publication is not yet exchange.	MOVEMENT
Gambia	The education tracker carries a learner identifier for 300,000-plus pupils; its link to other registers is still zero. The education ministry has run its system on the health-platform stack since 2018, tracking more than 300,000 students against a learner identifier introduced in 2020, with text-message attendance reporting for offline schools. The country use case records what it replaced: a fragmented, paper-based system. A learner identifier is the precondition for linking education to civil registration and social protection. That link has not been made: the interoperability indicator across those registers stands at zero. 2026-07 - the first register link to be agreed is between education and health: a memorandum connects the education and health information systems to flag vulnerable children and verify enrolment. It is a memorandum rather than a live interface, and the project indicator for register interoperability still stands at zero.	MOVEMENT
Ghana	A ministry dashboard consolidates four education systems and exposes programming interfaces for attendance, schools and enrolment rates. The education ministry's dashboard consolidates the education management information system, the school report card, the curriculum council's standards tests and the inspectorate's licensing system, and exposes structured programming interfaces for attendance, locations, test scores, school statistics, schools and enrolment rates. It is a working sectoral exchange layer rather than a policy for one. The specification states only a year, not a finer date, and nothing on this ledger dates a change to it inside the window. No consumer of the interfaces outside the ministry is named, and the education management system it draws on has no unique school codes, which is the join key an exchange across systems would need.	NO CHANGE a working exchange layer with no dated movement in the window

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	Dashboard reach stood at zero against end targets of 20 and 90 per cent in December 2023; a centralised graduate-tracking platform went to expressions of interest in September 2025. The starting position is measured and it is zero. A supervision report records the contract for reinforcement of the pre-university education management information system facing delays, and both dependent indicators at zero — stakeholders using net-accessible dashboards for decision-making at 0.00 against an end target of 20.00, and schools whose current-year indicators are net-accessible to decision-makers at 0.00 against an end target of 90.00, the latter carrying a USD 1,000,000 disbursement-linked condition at 0.00 per cent disbursed. 2025-09-30 - an expression-of-interest notice seeks an international consultancy to build a centralised platform for collection and analysis of data from the computerised graduate-tracking system of technical and vocational education, running nine months from a planned May 2026 start. A procurement act, not a delivered system. The sector's own systems are proliferating rather than joining: a national school map, digital registration of primary pupils, university registration of the baccalaureate cohort and an informatisation programme run alongside each other with no stated exchange between them.	MOVEMENT
Guinea-Bissau	A financed nationwide mapping produced a database of schools, teachers and students for all regions. The system it replaces produced its last published yearbook for 2014/15, with statistics training beginning across four regions in October 2025. A GPE-financed nationwide mapping produced a database of schools, teachers and students for all regions, with training on the Kobo Toolbox collection software (February 2026). Separately a monitoring dashboard replaced paper inspection forms, with 78 inspectors covering 568 schools.	MOVEMENT
Kenya	The education management system's validation engine is operational, checking learner records against official examination data. A multi-agency team was named in May 2025 to consolidate every student register from foundation learning to university into a single database (team). County directors were instructed in August 2025 to verify education data for primary, junior and secondary schools (circular). A learner validation engine is now operational, automatically comparing learner records against official examination records (guidance). Validation against one other register is the whole of the interoperability the repository records; the consolidated single database announced in 2025 is not reported as delivered. 2026-09 — the head of the public service convened the examinations council, the public service commission and the education ministry to link credential databases directly to hiring agencies. No design or date is set.	MOVEMENT
Lesotho	The education management system is rolling out on the DHIS2 platform, with a teacher system developed separately. 2026-05-11 — the education management information system is rolling out on the DHIS2 platform, the same platform the health sector uses. 2026-04-01 — a teacher management information system is being developed, informed by a peer exchange with Zambia, a workstream distinct from the education system. Two education systems are being built on separate tracks and the repository holds nothing on their connecting to each other or to the identity layer.	MOVEMENT
Liberia	A costed roadmap introduces national learner and teacher identifiers; the 2025/26 census moved to digital collection. The peer review records a stalled transition from a paper first-generation system to a digitised second, with limited integration across sub-sectors, weak legal frameworks, data gaps since 2022 and a proposed three-year US$4.5m action plan. A three-year modernisation roadmap validated 1-5 September 2025 introduces national unique learner and teacher identifiers for integration and traceability, and the 2025/26 national school census ran on school-based digital collection across all 15 counties and 125 districts from 27 March 2026. 2026-09-29 - the education ministry closed a two-day consultation to draft and validate an EMIS Policy for a real-time school data system.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Libya	The education data system now carries private schools and links schools by network, with no link to the civil registry. The system launched for the 2023/24 year covering school-level staff and institutions, and logged 498,653 pupils across 4,981 schools for 2025/26 with entry still under way. In July 2026 the ministry finished loading private-school data and launched a parent verification platform. Its own account of the data centre describes school links by wide-area network and mapping, with no connection to the civil registry or the national number — so the system is complete internally and isolated externally.	MOVEMENT
Madagascar	A permanent student identifier went national in May 2026; the ministry's data warehouse remains institutionally uncoordinated. An independent evaluation of March 2025 found the education ministry's data warehouse centralised and technically improved on international statistical standards, while institutional coordination and cross-ministry integration remained weak (evaluation). A unique student identification number was launched nationally in May 2026, targeting 4.2 million students across 19,303 establishments, 48 school districts and 17 regions, after a pilot enrolling 180,000 students (launch). The national interoperability platform launched in the same window (platform). No integration between the student identifier and the civil identity system is recorded.	MOVEMENT
Malawi	An education data portal moved into development in July 2026 to join the education system to other ministries' data. The starting position is the national readiness assessment's: it rates the country opportunistic on data exchange, citing the absence of a government-wide exchange platform and 50 per cent recognition of the national identity in enrolment. Half of enrolment not carrying an identity number is what makes an education exchange hard rather than merely unbuilt. 2026-07 - the education data portal moved into development, to integrate the education management information system with datasets held by other ministries, the statistical office, academia and development partners. No launch date, integration list or data-sharing agreement is published, and no exchange between education and any other system is yet evidenced as operating.	MOVEMENT
Mali	The education information system was worked against school health statistics in March 2026 — the first cross-sector use of it on the repository. The education management information system is in development and its one recorded exchange is with health. In March 2026 it was worked against school health statistics with the education and culture agency, which is the first instance on this repository of education data being joined to another sector's. Behind it, delivery is being supervised through a project status report of December 2025, against a system that has been peer-reviewed since 2017. No learner identifier is described, and no link to the national population register is reported.	MOVEMENT
Mauritania	The 2022 framework law requires an education management information system and sets no exchange protocol or learner identifier. The legal duty exists and is silent on exchange. The education framework law gazetted in October 2022 requires an education management information system run on results-based management at article 78, and prescribes a policy of digitalising teaching at article 72. It sets no interoperability standard, no exchange protocol and no unique learner identifier. What runs under it is a platform still being deployed — computers delivered to Trarza for the education platform in June 2026, against a joint action plan agreed in March — and one working outward link, the education certificate service on the national identity application. 2026-09-28 - a news site reported registration and transfer of pupils for the 2026-2027 school year opening on the Siraj platform on 28 September 2026.	NO CHANGE
Mauritius	A data infrastructure was tendered for the higher education regulator in February 2026, under a 2025-2035 sector strategy. The national strategy for higher education, science and research covers 2025 to 2035 (strategy). Consultancy services for a comprehensive and robust data infrastructure were put out to bid for the higher education regulator (notice). An education platform pilot was agreed with the incumbent operator in October 2025 (agreement). Nothing in the repository records an exchange between the education systems and the identity or civil registration layers.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Morocco	MASSAR was connected to the national interoperability platform by September 2022; the integrated system mandated by the 2019 framework law is not recorded built. The framework law of 2019 requires a national integrated education, training and research information system. Seven years on nothing in the repository records it in service. The programme that would carry it sets a different kind of target: 55,000 digitally skilled graduates by 2029. Beside the MASSAR connection set out below, the other recorded education data flow is an output rather than an exchange: 2026 examination results delivered by text message with certificates digitised from 18 June. One education system does exchange data: MASSAR and the unified social registry were among the systems operating on the digital development agency's interoperability platform in September 2022. What passes between them is not described.	NO CHANGE
Mozambique	No education-specific exchange exists. The 2017 interoperability decree is the only enacted instrument that reaches it. Education data is collected and not exchanged. The management information system is operating and being scaled to school level, with work on making it responsive, and nothing describes it passing data to another system or receiving an identifier from one. The instrument that would require it is general rather than sectoral: decree 67/2017, whose revision reached final consultation on 11 June 2026 while acknowledging persisting fragmentation, data duplication and absent common integration standards. The exchange platform itself is still in development. 2026-10-09 - the digital transformation agency trained 25 technicians from nine public bodies on the X-Road data-exchange layer, led by Estonian experts.	NO CHANGE
Namibia	The education management information system gained verification and online-examination features in 2025, and an interface architecture is set out for pushing results back into it. The ministry runs the system as a standing division collecting school data, with the annual education census published to the 2023 edition (system). Its examinations module was extended in 2025 with verification, case management and online examination features (highlights), and a ministry co-authored conference paper sets out an interface architecture for pushing examination data back into the management information system (paper). The education ministry launched a norms and standards framework for schools in August 2026, and a learning passport with a United Nations agency. The architecture is described and no live integration is stated. Nothing on this repository connects the education system to any register outside education.	MOVEMENT
Niger	The education statistics platform publishes annual yearbooks and exchanges with nothing. No link to the civil registers is described. Education data is collected and published on its own track. The statistics platform produced the school yearbook for 2024-2025 and the higher-education ministry its own series. Nothing describes either exchanging with another system. The reform that could change this is one register away. The May 2026 decree provides interoperability mechanisms between the national civil register, the population register and other functional systems, with a national unique identifier for every resident — the identifier a school system would key to. No education system is named among the functional systems, and no pupil identifier is described.	NO CHANGE
Nigeria	A credential repository integrating more than 250 tertiary institutions was deployed, and the learner number was linked to the national identity register. The repository deployed in March 2026 integrates more than 250 tertiary institutions for real-time credential verification, against certificate fraud. The education ministry disclosed in July 2026 that the learner identification number has been integrated with the national identification number through the education management information system, extending trusted digital identity to nearly 80 million learners. Both sit on the national education data platform announced in June 2026, for which no go-live confirmation or record count is held. 2026-09-08 - the education ministry disclosed talks with the national youth service scheme on an interface to exchange records and verify qualifications against the repository. Nothing is built and no data scope is published. 2026-08-14 - the platform's developers reported the national education information system live nationwide from 1 July 2026, with 124,548 schools, 58.4% of national coverage, and more than 40 million learners recorded.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Rwanda	Consolidation of an integrated system remains delayed across five separate component systems; a technical partnership began in February 2026. The sector strategic plan for 2024 to 2029 records that consolidation into an integrated education management information system remains delayed, and that five component systems — school data, teacher, capacity, learning materials and basic education — remain institutionally fragmented and live (plan). A technical assistance partnership announced in February 2026 strengthens the student-absence tracking system and data integration across the school data and sector management systems and partner platforms (partnership). That addresses one flow rather than the consolidation the plan describes as overdue.	MOVEMENT
Sao Tome and Principe	The school management system was still at implementation stage in 2026, with technical assistance tendered in April and national supervision dashboards tendered in May. The sector compact records that the system was introduced and that the education ministry and the lender are developing it to link information between the central level and the districts, describing the education data layer as a medium-priority enabling factor still being built (compact). Specialist technical assistance in technological infrastructure, resource management and training for the system's implementation was tendered in April 2026 (assistance), and a separate tender opened in May 2026 for a higher education institution to develop dashboards for national education supervision (dashboards). Two procurements for the same layer, from two different funders, in successive months. Nothing held states an interface between the school system and any other government system.	MOVEMENT
Senegal	A school management platform launched as the national norm in October 2025, above a unique education identifier deployed nationwide. The platform launched on 3 October 2025 gives inspectors, head teachers, teachers, pupils and parents personalised interfaces with real-time data access, and the minister presented it as the national norm rather than an optional experiment; it was built by the ministry's own developers. A head teacher named unstable connectivity, insufficient equipment and access difficulties at peak periods in the same account. Underneath it the ministry states nationwide deployment of an alphanumeric unique national registration number for every actor in the system, teacher and pupil alike, generated at enrolment. The same documentation shows the fallback exchange route is spreadsheet export and import rather than a system-to-system interface.	MOVEMENT
Seychelles	The ministry took a national education management information system live in March 2026 — the shared platform this question asks about. The go-live was announced by the implementation partner rather than by the ministry (go-live). Around it sits a four-year SMART Plan to modernise teaching, extend technology access in schools nationwide and improve administrative efficiency, paired with a university-built intranet (plan). No school-coverage figure, data standard or interface to any other government system is held, so what is established is that a national platform exists and not that it exchanges anything.	MOVEMENT
Sierra Leone	A national education data hub is being built on DHIS2 to connect fragmented systems and link learner records to the national identity number. The ministry is partnering with the HISP network to connect fragmented education data into a single DHIS2-based hub and link every learner's school records to the national ID (hub). A unique learner identifier system and data warehouse went out to tender through UNICEF in October 2025 (tender). The system being displaced is the education data explorer the innovation directorate has run since 2020 (explorer). No go-live date, connected system list or award under the learner-ID tender is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Somalia	The high school certificate system connects identity, payment and registry building blocks so results are retrieved and certificates issued automatically. The system connects registration, identity verification and consent through the national identity credential, payments through the government payment service, and the examination registry, so exam results are retrieved automatically and certificates issued digitally (system). It is the clearest documented operational interoperability in any Somali sector, and it is one service rather than an architecture. A national identity conference in November 2025 recorded the credential integrated into education alongside financial services, commerce, public financial management and immigration (conference).	MOVEMENT
South Africa	School administration modernisation entered user acceptance testing, while the post-school learner platform is at risk from an intellectual-property dispute. 2026-02-04 — user acceptance testing began on the modernised school administration system ahead of phased national implementation, with provincial education information officials and the state IT agency participating. The standing interoperability instrument beneath it is an education data-coding standard of 2011, which has not been revised on the record. 2026-08-20 — against that, an intellectual-property dispute and weak departmental buy-in put the post-school integrated learner management system at risk, with the shared platform piloting in sector education authorities. The dispute is over who owns the platform rather than what it does, which is the failure mode a shared system in the public sector is most exposed to and the one least visible in a delivery report.	MIXED the school administration system entered user testing while the post-school learner platform was put at risk by an ownership dispute
South Sudan	The education data landscape is largely manual and fragmented with limited interoperability; a costed reform plan was produced in March 2026. Four parallel education data systems were assessed against a common framework and found to diverge on coverage, frequency and accessibility, with harmonised indicators and stronger cross-system coordination called for (assessment). A continental education body and the education ministry then documented the landscape as largely manual and fragmented across multiple systems with limited integration between data streams and limited interoperability (diagnostic), and produced a costed national action plan over three days covering capacity development, data quality, infrastructure and system integration, governance and decentralisation (plan). The problem is named and priced. Nothing yet connects the four systems.	MOVEMENT
Sudan	Certification is fragmenting rather than converging, and the education information system's last evaluation found weak federal-state integration. A regional director warned on 10 June 2026 that fragmented certification systems risk creating barriers that outlast the conflict, and called for the same nationally recognised examinations to be administered consistently across Sudan and in refugee-hosting countries (statement). The only evaluation of the education data architecture the repository holds documents weak federal-state integration and incompatible software and inputs across the federal ministry, 15 state ministries and locality offices (evaluation). It predates the war by over a decade. The transitional education plan sets out building the foundation for a full system rather than repairing an existing one (plan).	REGRESSED
Tanzania	Institutions were directed in July 2026 to integrate their platforms into the education system, which is built and in testing. The education ministry reported in January 2026 that its sector management information system had been built and testing begun, designed to integrate data from the identity authority, the registration agency, immigration, foreign affairs and the local government ministry. In July the permanent secretary directed institutions to fast-track integration of their own digital platforms so enrolment and other statistics are reachable without manual requests. A national validation workshop in March 2026 advanced a draft electronic data governance strategy setting interoperability and data-sharing direction across sectors including education, which the government's own representative described as not yet adopted. No go-live date or connected-institution count is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Togo	The interconnection project was recorded as not taken up in January 2025; one results channel opened in June 2026. The supervision report archived 14 January 2025 records a prototype management information system, a human-resources system in test and a learning-assessment dashboard — and then the finding that settles the indicator: the mission noted a non-appropriation of the project of interconnectivity of platforms and databases. At the June 2026 examination round results went out through a web platform, a messaging chatbot and a second bot, and the ministry supplied each establishment with its own pupils' results directly, so schools no longer wait to compute their statistics. A single results channel is not an interconnection, and no source records the project being taken up since.	MOVEMENT one channel only
Tunisia	A unified school-life portal linked the citizen account to the student record and enrolled 53 per cent of pupils by 20 August 2026. The unified Vie scolaire portal launched at the end of July 2026, linking a citizen account to the student record, and had 53 per cent of pupils enrolled for the 2026/2027 year by 20 August. Families reported the online enrolment period as an ordeal, and no outage log, completion rate or ministry response is on file. The portal's relationship to the ministry's other education platform is not stated, and no exchange with the civil register, the health identifier or the social schemes is described — the link is to the citizen account, not between systems. The enrolment campaign the portal carries reached 1.691m pupils by 3 September 2026, 81 per cent of those eligible, on the education ministry's figures.	MOVEMENT
Uganda	Data-governance guidelines launched on 8 June 2026 make registration mandatory for every school, closing the policy absence the ministry's own account had named. 2025-03 - the education ministry's own systems assessment documented the management information system moving to a central platform with integration planned to teacher, inspection, refugee and examinations data (assessment). 2025-12 - an issue brief found that multiple unaligned systems continue to fragment education information management and that the absence of a formal policy has contributed to limited accountability and a weak data culture. 2026-06 - guidelines launched on 8 June 2026 answer that directly: compliance requirements and sanctions for officials and institutions, mandatory registration for every school, a unique learner identification number, and capitation grants determined from the system's data. Tying money to the data is the mechanism, and it is also the risk: the same account names misdeclaration of information as a standing problem, and the repository holds no audit of the data the grants are calculated from. 2026-06-09 - a press account reported the Auditor General finding that critical administration of the education information system remains largely under its private vendor's control.	MOVEMENT
Zambia	Higher education institutions were directed to submit student data for a centralised database with institution-independent index numbers. A mid-term review records education management information system reform under way with a teacher database review under consideration. 2026-03 — the higher education authority directed all institutions to submit student data for a centralised national student database with institution-independent index numbers, under the 2021 amendment Act. No linkage to the national identity or civil registration registers is stated, which is the connection that would make the index durable. 2026-06-12 — a sector-wide education and skills data challenge and its technical working group were launched, the leading sector data-governance development in the window.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zimbabwe	A dropout early-warning system now runs off the education management information system, and a school-registration system with EMIS integration went to consultancy in April 2026. A 2019 peer review of the education management information system found education data submitted to the statistics agency but no formal structures for data sharing among key stakeholders, and recommended stronger inter-ministerial linkages and a data reporting and sharing calendar (review). An early warning system integrated with the education system now generates real-time lists of learners at risk of leaving school; the 2025 data behind it showed almost 40,000 learners dropped out that year (early warning). A web-based school-registration information management system with satellite-school tracking and explicit integration to the education system went out as a five-month national consultancy on 16 April 2026, closing on 28 April (consultancy). Both moves are integrations inside the education sector; the repository holds no exchange between education systems and any other government register.	MOVEMENT

Interoperability of social protection systems

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The solidarity portal's pilot tested database integration and interconnectivity across the sector's services. 2026-03-12 - the pilot of the solidarity sector's unified portal assessed service accessibility, database integration and interconnectivity as a step towards intelligent digital administration, carrying solidarity-allowance enrolment and the digital disability card on one platform. That is the only social-protection exchange the repository holds, and it is a two-commune pilot. Nothing states which databases are joined, whether the national identification number is the key, or whether the sector connects to the national interoperability system created as the exclusive channel for inter-agency exchange - whose obligations have not started.	MOVEMENT
Angola	The single social register, not operational in June 2024, was launched as a centralised platform in July 2026 with stated articulation to civil registries. The two ends of the window bracket a real change. The financier's status report recorded the single social register still not operational as of June 2024, while integration of the cash-transfer programme's management information system with the social-action ministry's own system was well advanced and that system was available in 54 social action centres. In July 2026 the register was launched in modernised and expanded form, with biometric, facial-recognition, georeferencing and documentary validation, one record per citizen, and stated articulation between social programmes, local administration, civil registries, public institutions and sectoral databases; a pilot phase began at Sumbe in August. What is stated is articulation; no exchange is yet reported running.	MOVEMENT
Benin	The social register was scoped and financed, the safety net programme launched, and the identity register now underpins both. The single social register was launched and scoped, financed through the regional identification project and expected operational within six months. 2025-10-18 — the safety-net programme was launched. 2026-02-25 — the identification agency's platforms underpin the enrolment on which those transfers depend. The registers are joined; no figure for records exchanged between them is published.	MOVEMENT
Botswana	The Single Social Registry was operationalised and covered 98 per cent of beneficiaries in the five main programmes by March 2025. 2022 — a review described the registry's identity validation link and its proxy-means-test software, following a pilot in a handful of districts. 2025-10-07 — a completion report verified coverage of 98 per cent of beneficiaries in the five main programmes by March 2025, against a target of 75.8 per cent. 2025-11-11 — the State of the Nation Address announced the registry's operationalisation and the introduction of proxy means testing. No list of the systems the registry exchanges with is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burkina Faso	Funded and being designed: a financier will integrate the single social register with the unique identifier, the safety-net project, the health insurance fund and the displaced-persons database, on financing approved 15 June 2026. The register exists: 362,698 households and 2,217,518 people, of whom 1,191,859 women, across 99 communes in ten regions, with about fifty further communes prepared for 2026. 2026-05-22 - the appraisal confirms the register and finances its planned interoperability with the unique identifier programme, the productive safety-net project, the health insurance fund and the displaced-persons database via an application interface on the state payments platform. It is design and funding, not a completed exchange. 2026-06-15 - the financing, US$100 million of credit and US$20 million of grant, was approved, expressly to expand the register's coverage and promote its integration with other key databases including those for internally displaced persons and health insurance. The identifier the integration turns on is stated not to replace other administrative identifiers but to form their common digital base. 2026-10-09 - the digital-transition minister said enrolment for the digital identity, budgeted at over FCFA 40bn, was due to start in October 2026.	MOVEMENT
Burundi	More than a million beneficiary records were migrated to a shared platform connected to several payment providers, with extension to the unified registry prepared. A technical policy note describes the position reached: the programme's management information system migrated to a shared platform, hosted in the government data centre, with modules in operation and an interfacing architecture that supports integration with identity databases — but does not confirm a live link to civil status or the national identity system. 2026-01 — more than a million individual beneficiary records were migrated, the system connected to several payment providers, and its extension to the unified social registry prepared. The connection this system has made is to payments; the connection it has not made is to identity, which is the one that would let it verify who it is paying.	MOVEMENT
Cameroon	The adaptive safety nets project took additional financing in August 2025; the unified social register it feeds is equipping 100 pilot social centres. The register is the object any interoperability would run through: its registration programme was launched on 23 August 2024, equipping 100 pilot social centres across the ten regions with a computer, printer, modem and internet subscription. 2025-08-18 - a financier's project paper proposes an additional credit for the adaptive safety nets and economic inclusion project, the operation that carries beneficiary identification and payment. The capture is truncated part-way through the first component, so what it provides for on interoperability is not established from it. Nothing states that the register exchanges data with the identity system, the payroll system or any sectoral database. The country's participation in a twenty-one-country programme on inclusive digital social protection is the nearest thing to a stated ambition for it.	MOVEMENT
Central African Republic	A social registry is in development under a food-crisis project, with a payment platform for transfers at feasibility stage. Both halves of a social protection system are being procured at once and neither exists yet. The register is in development under a food-crisis project's additional financing, and the payment layer is at feasibility tender stage. Nothing describes exchange between them, or between either and the mandatory unique identification number that would let a beneficiary be recognised across both. Where transfers reach people today they reach them over mobile money, and the salary payment case shows the fragility of that when a province loses network for a month.	MOVEMENT
Chad	The social registry and the biometric register are not yet linked: the accord to identify every entrant by identity number was unsigned in March 2026. The unified social registry is described as centralised, dynamic, spatially aware and interoperable with other systems, carrying 684,500 households under the adaptive social protection strategy for 2025-2030 (registry). The agencies behind it met on 10 March 2026 on interoperability between the registry and the national biometric register, so that every entrant is identified by their national identification number; the accord was not yet signed (meeting). Enrolment meanwhile continues: a joint mission briefed authorities of the capital's ninth arrondissement in January 2026 ahead of a household enrolment operation (mission). Interoperable in description, not yet in fact.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	The supervision mission lists interoperability with the identity, civil-registration and health systems as work still recommended. The social register is the country's most complete population dataset outside civil registration, and it stands alone. The December 2025 mission put its technical build near complete and disbursement at 82.8 per cent, while listing interoperability with the identity, civil-registration and health systems as work still recommended rather than done. The register's founding decree of 23 June 2020, whose text is now on file, sets its creation, organisation and functioning in fifteen articles and no data-sharing obligation is recorded from it. What this leaves is a household register built to identify the poorest and no route from it to the systems that would confirm who they are.	NO CHANGE interoperability is recommended work rather than delivered
Congo	A technical management unit for the single social register was created by order in April 2025, and the register was given a headquarters with its own data centre. 2025-04-17 — an order created the technical management unit for the single social register. 2025-12-22 — the mid-term review of the productive inclusion project was recorded. 2026-04-14 — the register was inaugurated in a headquarters with its own data centre, shared with the social safety nets programme, and is described as the centralised base for identifying beneficiaries. A register with premises and a purpose; no interface to the identity system is recorded.	MOVEMENT
Cote d'Ivoire	The regional unique identification project's figures did not move: disbursement 38% against a 70% target. The latest implementation status report held, archived 2 May 2025, puts disbursement at 38% against a 70%-by-December-2025 target and health-insurance enrolment at about 60%. 2026-02 - a social evaluation across ten sub-prefectures was restituted to the sub-prefects, which is the only later activity on file. No later status report is held, so the December 2025 disbursement target is unverified either way, and the project's own identification-to-services linkage has no published outcome.	NO CHANGE
Djibouti	The social registry's interoperability upgrade with the state information-systems agency is still reported as under way. The registry was undergoing an audit, an operational-manual revision and an interoperability upgrade with the social affairs ministry and the state information-systems agency as the period opened. 2026-02 - the first supervision report since effectiveness records the scaling component had not commenced activities as at 31 January 2026, with implementation readiness only. Nothing states the upgrade completed. Ahead of it, real-time identity verification for social protection is named as in preparation. No connection between the registry and any other system is on record as made.	NO CHANGE
DR Congo	A decree of December 2025 creates a single social register with interoperability provisions, over management systems an earlier project already built. Decree number 25/041 of 4 December 2025 creates a single social register, centralising beneficiaries' biographic, demographic and biometric data under a steering committee and a technical management unit, with interoperability provisions (decree, adoption). The financier's closure report for the eastern recovery project records that operation as the one that built the country's social-protection management information foundations under the social affairs ministry (closure report). No operator, household enrolment figure or link to the identification office is held for the new register, so what the interoperability provisions connect to is not established.	MOVEMENT
Equatorial Guinea	The social protection law specifies no registry or management system; the insurance institute's system is obsolete and unreplicated. The institute's own delegate told parliament in April 2025 that its information system is obsolete, unreplicated and dependent on a single internet provider — a single point of failure stated by the operator. The law that might have required better passed at second reading in March 2026 specifying no registry and no management information system. What has changed is payment channel rather than data: benefits are now paid bank-only and a 2025 census purged 2,282 untraceable pensioners.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	A vulnerability database was established in the labour ministry; nothing states it exchanges data with any other system (results report). United Nations support helped the labour and human welfare ministry establish a vulnerability database to collect, collate and analyse gender-segregated data on persons with disabilities, single-women-headed households and other vulnerable groups (results report). The report does not state that the database exchanges data with the population registers, the health information system or any payment mechanism, and a 2022 structured assessment records no system exchanging data across social insurance (dataset). So the repository holds one database and no exchange, which is the whole of what can be said.	NO CHANGE a first statement of the position with nothing on exchange
Eswatini	The social registry reached its second region in August 2026, and the provident fund is cleaning client records ahead of pension conversion. A second regional rollout began in Lubombo in August 2026 on an E41.7 million data-collection exercise, after 44,683 households were registered in the first region (rollout). The deputy prime minister's office had reported the registry under development with project documents finalised and a first regional pilot from March 2025 (annual report). The national provident fund reports going paperless and beginning a know-your-customer data-cleaning exercise on client records ahead of conversion into a national pension scheme (fund). Both are preparing data rather than exchanging it: nothing on the repository records the registry reading from, or writing to, another government system. 2026-10-07 - the provident fund launched Express Claims, a three-hour payout target piloted for claims up to E5,000, with a card payment gateway for contributions.	MOVEMENT
Ethiopia	A US$200m successor safety-net project moved the national social registry from appraisal into funded implementation (approval). The World Bank board approved the sixth Productive Safety Net Project in March 2026, a US$200m credit committing to stronger digital tools and improved monitoring behind safety-net delivery and moving the national social registry from appraisal into funded implementation (approval). The founding requirement is the 2023 digital identity financing agreement, which requires a digital stack including a whole-of-government data exchange platform and open APIs, and prioritises integration into public services including social protection (financing agreement). The repository holds the commitment and the money. It holds no statement that the social registry actually exchanges data with the identity system, the civil register or the payment rails.	MOVEMENT
Gabon	A 2008 decree already required five bodies to supply the health insurance fund a consolidated statement; a task force convened in July 2026 programmes interconnection with three of them. The technical decree of the compulsory health insurance and social guarantee scheme defines registration as the administrative act of entering a person on the fund's roll and issuing the identifier, specifies the insured card and a per-provider identification code, and requires the social security fund, the state computing directorate, the budget, the treasury and the tax directorate to supply the fund a one-off consolidated statement. 2026-07 - eighteen years later an interministerial task force met for the first time under the vice-president with four ministers, its programme naming an independent financial, accounting and actuarial audit of the fund, automation of the transfer of public contributions with a dedicated treasury account, and interconnection of the fund's information systems with those of the social security fund, the tax directorate and the treasury. The same three administrations are meanwhile building a shared payroll declaration, which is the exchange the task force describes arriving by another route. The unified social register that would sit over it has presented its first deliverable.	MOVEMENT
Gambia	The social registry was closed out highly satisfactory in 2024 and still connects to nothing. The project that built the registry closed in June 2024 rated Highly Satisfactory, with US$29.8m of US$30m disbursed. Its connections were left to a successor operation, whose November 2025 report puts them at zero with one link under verification. The 2019 design roadmap had anticipated the problem: it was written before a national identity existed to link the registry to.	STALLED

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	Terms of reference were issued for a platform linking the household registry, cash grants, health insurance, the payment switch and the identity register. 2026-08-29 - the gender ministry issued terms of reference for a cross-system data-exchange architecture linking the household registry, the cash-grant programme, the welfare case and information systems, the health insurance scheme, the payment switch and the national identity register through a unified platform. It is a procurement, not a build. 2026-01-29 - a technical working group convened with donor support to assess fragmented social-protection data coordination and develop an integrated coordination and sharing framework across ministries, regional councils and assemblies - the governance track alongside the build. 2025-10 - a development bank mission reviewed progress toward full integration of the ministry's management information systems.	MOVEMENT
Guinea	Exchange happens by protocol, not by interface: an agency signed with the social fund in June 2024 to use unified register data to reach 51,259 indigent households. 2024-06-27 - the directors general of the economic and social inclusion agency and of the social development and indigence fund signed a protocol for the agency to use secured data from the unified social register, in order to reach 51,259 indigent households across nine prefectures under a food-shock window. The protocol text is not published and the exchange is bilateral and request-based. That is what the register's own creating decree provides for: interoperability and data access governed by protocol with the fund, with technical arrangements deferred. The register is operating without a unique identifier, which is the missing piece any automated matching would need. 2026-07-08 - presenting the register's first coverage analysis, a United Nations agency framed the next step as an integrated register of natural persons interoperable with other government databases and linked to a national unique identification number.	MOVEMENT
Guinea-Bissau	No social protection register or management system is described for Guinea-Bissau. Nothing in the repository names a Guinean social registry, beneficiary database or social protection management system. The delivery mechanisms that exist run through payroll rather than a register: the blockchain wage bill and pensions platform the ledger carries, and the payment institution licensing that made electronic money possible at all.	NO CHANGE
Kenya	The Social Protection Act 2025 gave the sector a statutory framework, with grievance and case management guidelines issued in October. The Act commenced in August 2025, establishing the National Board for Social Protection and a framework for non-contributory interventions (act). The second social economic inclusion project issued enhanced grievance and case management operations guidelines in October 2025 (guidelines), alongside an environmental and social management plan (plan). The project runs across three state departments, which is where the interoperability question actually sits. In September 2026 the project sought a consultant to upgrade the Enhanced Single Registry and the community development information system to exchange data with the health authority, the social security fund, the population register and civil registration. That is procurement; nothing in the repository records data flowing between those systems yet.	MOVEMENT
Lesotho	Digital birth registration feeds the social registry, with a district data refresh run from December 2025. 2025-06-19 — digital birth registration under the child programme is integrated with the social registry, the repository's clearest evidence of two national registries exchanging data. 2025-11-12 — a registry data-refresh exercise ran from December 2025 to March 2026. 2026-02-26 — the identity work plan references alignment with the second national social protection strategy. No data-sharing agreement or technical specification for the linkage is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Liberia	Registry integration with other national systems is recorded as ongoing, with no system named as connected. The implementation report of July 2025 puts the household social registry at about 442,000 records and states that registry enhancements and integration with other national systems remain ongoing. The independent completion review of the earlier project describes what was built — the registry plus an integrated system with enrolment, payment, monitoring, grievance-redress and access-management modules, held by the gender and social protection ministry. No connection to the identity register or to any other national system is recorded as live.	NO CHANGE
Libya	The Libyan Zakat Fund's digital platforms took integration through the national data exchange as their reference model in April 2026, the only such case on file. The identity authority's April 2026 guide records the Zakat Fund adopting integration via LY-NDEX, digital identity verification and the once-only principle for its platforms (guide). No other social-protection body is recorded as connected, no data-sharing agreement is published, and the fund's own integration is described as a reference case rather than as completed work.	MOVEMENT
Madagascar	The household census and biometric identity databases are being merged into a social protection registry, unfinished at February 2026. A World Bank mission report of December 2025 records 5.09 million households and 19.7 million provisional unique identifiers captured by the household census, being merged with the biometric identity database, with merger, funding and enumerator payment unresolved (mission). A technical committee met in February 2026 and set data quality, security and resumption of field operations as priorities, targeting completion in September 2026 (committee). A proposed USD 50 million additional financing would expand the national social registry across all 23 regions and fund transition to mobile payments (financing).	MOVEMENT
Malawi	3,233,708 of 4,377,763 social registry households, 74 per cent, are linked to national identity numbers. This is the country's deepest data exchange and the repository can put a denominator under it. The evaluation of the urban cash intervention documents the registry-to-payroll-to-mobile-money pipeline and its cross-checking against the identity and mobile-money databases. 2026-02 - 3,233,708 of 4,377,763 registry households, 74 per cent, were linked to national identity numbers, through a real-time integration module. 2026-06 - the finance ministry's kick-off workshop for making the registry dynamic includes data integration to link it directly with other functional management systems, and a six-month pilot in Balaka and Dowa tests on-demand updates through district offices, a mobile short code and village committees.	MOVEMENT
Mali	The unified social register ran an enrolment campaign from November 2025, and health insurance is being delegated under management contracts. Three systems sit in this space and the window moved two of them. The unified social register ran an enrolment campaign from November 2025, on a design set out in a technical paper with a financier. Universal health insurance moved onto delegated management contracts in July 2026, and pension payment is being digitised at the social security fund. What no source describes is exchange between them, or between any of them and the national population register. Each enrols its own people.	MOVEMENT
Mauritania	The social register platform verified 2,057,006 citizens by June 2026 and pays through the interbank switch. Social protection is the most connected part of the Mauritanian state on this repository. The social register's platform had verified 2,057,006 citizens by June 2026 and was opened to the capital's three wilayas in April; digital transfers run through the interbank payment operator. A second register was created beside it: the 2025 decree establishing the database of households affected by disasters, explicitly alongside the social register. What no source describes is the exchange between them, or between either and the population register.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritius	An e-Social Security system was tendered in October 2025 over a social register decided in Cabinet in 2009. The social register was decided in Cabinet in March 2009 (decision). An e-Social Security system was put out to tender in October 2025 for supply, installation, testing, commissioning and maintenance (tender). Cabinet used the register in February 2026 to target a free-internet measure (Cabinet) — the clearest evidence held that the register is joined to another system's delivery, and the only such use on file.	MOVEMENT
Morocco	The identity and targeting project sets five social programmes using the registries by end-2024 and eight by 2028, with no delivery reported. The project approved in December 2024 states those targets, with the two registries having enrolled about half the population at approval (project). The end-2024 target date has passed and no count of programmes actually drawing on the registries is held, so the repository records the design of the interoperability and no evidence of its use.	NO CHANGE
Mozambique	The disaster institute is piloting a digital beneficiary register designed to interoperate with the social action database to check who has already received assistance, with national rollout planned for October 2026. 2026-08-10 — the disaster management institute began piloting a digital beneficiary-registration system in Beira, designed to interoperate with the social action institute's beneficiary database to cross-check who has already received assistance and avoid duplication, with national rollout planned for October 2026. It is the most concrete social-protection interoperability movement in the window and it is pre-launch. The governance frame moved in the same window: the revised government interoperability regulation reached its final consultation in June 2026, bearing on social protection among other sectors. Duplication is the problem this exists to solve, and no measure of it — before or after — is published, so the pilot's own case cannot be checked against the record.	MOVEMENT a cross-checking link is designed and piloting rather than running
Namibia	Grant beneficiaries are now cross-checked against the population register — 15,825 old-age grants were suspended in June 2026 — and the first grant payments ran over the instant payment network. The 2021 social protection policy commits to an integrated management information system linked to the national population register (policy). Two ministries cross-checked grant beneficiaries against the population registration system and suspended 15,825 old-age grants whose holders could not be verified (suspension). The first live government-to-person grant payments ran over the national instant payment network on 17 June 2026 through one certified bank (payment). An integrated beneficiary registry is in use and linked to the register. The interoperability is real, and its first published effect was that number of people losing a payment (suspension); no figure for how many were subsequently restored is held.	MOVEMENT
Niger	A task force under the state technology agency was set up in February 2026 to move identification onto an open-source interoperable architecture. The architectural decision was taken in the window. A financier's supervision mission of 3 to 6 February 2026 established an interinstitutional task force, coordinated by the state information systems agency, to evolve the identification system's technology architecture toward an open-source interoperable solution, and aligned the national population register with the civil-status system. The social protection systems that would consume it already exist and already have identifiers of their own: the unified social register, at more than 500,000 households and carried into a third project phase in May 2026, and the safety-net delivery system. No exchange between them and the population register is yet reported running.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	A unified national architecture was flagged off in March 2026 to replace fragmented humanitarian and social-protection data systems. The system flagged off on 25 March 2026 sets out a unified national register, a poverty exit pathway and a poverty intelligence lab, explicitly to replace the fragmented humanitarian and social-protection data systems. The exchange it would run over is in production behind the government service portal, and a public review session in December 2025 took its draft technical standard and the life-events framework to federal and state stakeholders. The standard is still marked draft, no adopted version is held, and the lawful basis on which the exchange moves personal data is not on record.	MOVEMENT
Rwanda	The social registry covers over 95 per cent of the population and is interoperable with more than ten government databases. The project paper approving a USD 80 million additional credit records the registry covering over 95 per cent of the population and interoperable with more than ten government databases, and describes the programme moving from build-out to interoperability strengthening (paper). The payments layer beneath it was nationally launched in December 2025 as a digital public good connecting banks and mobile-money platforms (launch). The sector plan sets out the division of labour: a registry serving targeting and a management system serving beneficiary and monitoring functions (plan).	MOVEMENT
Sao Tome and Principe	The social protection information system was rebuilt in 2024 on open-source components and is integrated with the unique social registry, which holds data on 8,740 families. The directorate's own page describes the system as a unified database for registration, management of beneficiaries, monitoring of cash transfers and reporting, with the exchange function it claims internal to the directorate and its partners (system). The project paper records adoption in 2024 of a new open-source management information system, states that for the first time in the country's history it is fully owned and operated by the government, and reports it integrated with the unique social registry, which holds socio-demographic characteristics on 8,740 families, about 16 per cent of the population (project paper). The same paper places digital identity linkage as an intended synergy, not an operating one (project paper).	MOVEMENT
Senegal	A two-day workshop opened in July 2026 to diagnose existing systems and settle interoperability and data governance for a unified social-protection information system. It covers five named social programmes, and no budget, timeline or lead technical agency is reported (workshop, system). Data governance is an output of the workshop rather than an input to it, which is the same ordering the health interconnection and the digital addressing relaunch show: the systems are being designed and the rules that would govern them are being written afterwards.	MOVEMENT
Seychelles	Information-sharing protocols are signed with health, employment and education, while the management system behind the social registry remained pending. The lender's June 2025 status report records signed inter-agency information-sharing protocols between the social protection agency and health, employment and social affairs, and education, while the agency's management information system needed for the social registry and for broader interoperability remained pending (status). The platform launched internally in October 2025 through the SeyID portal (launch); in March 2026 Cabinet extended vendor support through 2026 and directed the ICT department to lead the transition to government ownership and a long-term national platform (Cabinet). The protocols are signed and the system that would use them is being stabilised.	MOVEMENT
Sierra Leone	An amended memorandum between the social action commission and the statistics office was signed in April 2026 to take the social registry towards national coverage. The commission and Statistics Sierra Leone signed the amended memorandum on 8 April 2026, to expand the Social Protection Registry for Integrated National Targeting and improve programme delivery (memorandum). A separate inter-agency agreement on gender-based violence case referral was signed in February 2026 between the gender ministry, the social action commission and the anti-corruption commission (agreement). Both are bilateral instruments between named agencies. No general legal basis for data sharing between government registers exists, which is recorded separately as an unsettled gap.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Somalia	The social registry and delivery system support over 500,000 households, and a working group was agreed to link the registry to the national identity credential. A USD 35 million crisis-response grant approved in May 2026 scales drought-response digital and mobile cash transfers through the delivery system and the unified social registry, which the document treats as the operative national architecture (project paper). The ministry closed its final implementation support mission in November 2025 reporting both platforms established and supporting over 500,000 households (mission). The November 2025 identity conference agreed a technical working group to integrate the national identity with the social registry and humanitarian safety-net systems (conference) — agreed, not built.	MOVEMENT
South Africa	The Public Protector found the student funding scheme insufficiently integrated with home affairs, social security and revenue data, and gave the board 30 days to produce a plan. 2026-08-18 — the Public Protector found the student funding scheme's systems insufficiently integrated with the home affairs, social security and revenue data sources it needs to verify students, and directed a digital modernisation and systems-integration plan within 30 days covering institutional integration, verification interfaces, fraud controls and cyber security, elimination of duplicate applications and manual workarounds, student-facing case tracking and costed milestones. The report draws on a 2023 investigation that found some 40,000 non-qualifying students funded to more than R5.1bn, and records that the scheme cannot resolve 80% of contact-centre queries without internal escalation. What has advanced is an order with a deadline attached; no plan, integration or interface is on the record.	MOVEMENT an integration plan ordered rather than built
South Sudan	The beneficiary registry reached 87,867 households but remains project-scoped rather than a shared registry. A World Bank project paper describes a government-led management information system linked to biometric beneficiary registration, project-scoped rather than a standalone universal social registry (paper). By September 2025 it had biometrically registered and paid 87,867 households, 615,069 people, across 15 counties (scale). Nothing reads from it but the project that built it. No other programme, ministry or register is recorded drawing on the same data.	MOVEMENT
Sudan	A closed project's registry-linked platform is the achieved case; a new shared platform is specified against open standards. The completion report of 28 February 2025 documents that the safety-net project's management system held a data-sharing platform linked to the national civil registry over an interface, and was linked to payment providers for delivery (report). The project has closed; its registries and rails are reported still usable (retrospective). Technical specifications dated 15 December 2025 for a shared humanitarian cash platform are aligned to open government-to-person standards so it can interoperate with national social-protection systems over time (specifications). That alignment is a design intention, not a connection that exists.	MOVEMENT
Tanzania	A 250 million dollar credit approved in March 2026 expands a social registry over the government exchange bus. The government's own technology roadmap of February 2024 records the enterprise service bus, the cross-agency exchange platform, as established and in use by public institutions; it is the only exchange instrument the repository holds with evidence specific enough to serve as a baseline here, social protection having no dedicated exchange of its own. The World Bank board approved a 250 million dollar credit in March 2026 for the third phase of the productive social safety net, expanding digital delivery systems including a social registry and strengthening the links between social protection and other systems. What the registry holds, and what it exchanges with, is not stated.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Togo	Cash transfers to more than 700,000 people launched in December 2025 without evidence that the social registry keyed them. The registry was created by decree of 24 April 2023, is held electronically, carries the unique identification number and a household number, and obliges the identity agency to assure interconnection with administrations' databases existing or future. The last supervision report held records it 75 per cent built and the data-exchange platform not in place at 30 September 2024. The transfers launched on 18 December 2025 at 25,000 FCFA a household were targeted by the statistics institute and the development agency on poverty criteria and paid through two mobile-money services. That is a statistics-to-agency-to-provider chain: no source says the list came from the registry or that the number keyed the payment.	MOVEMENT
Tunisia	Social-affairs interoperability services were listed complete at end-2025, and a national app now exposes health-insurance and social-security data. A 2022 framework agreement between the ministries of social affairs and health and the national computing centre set up data exchange between them, reporting over 6 million health-insurance operations across 92 health facilities on the Labes card. The Council of Ministers listed interoperability services for the social-affairs sector among the digital-transformation projects completed by the end of 2025, alongside phase one of the national interconnection platform. The Khadamet application, launched in August 2026 and authenticated by the mobile digital identity, exposes health-insurance and social-security career and contribution data alongside tax, traffic and civil-status services. No service list, transaction volume or scheme-coverage figure is published behind the completion claim.	MOVEMENT
Uganda	The single registry launched in 2021 has no operational record since, while the parish programme's system covers nearly 79 per cent of households. The instrument is the National Single Registry, launched in February 2021 as a unified platform holding common information across social protection programmes and premised on linking programme management systems to the national identity database. Five years on the repository holds no statement of its coverage, its linked programmes or the records it holds. 2025-08 - the programme system beneath it is another matter: it captures beneficiary names, identification numbers, locations, enterprises, borrowed amounts, repayments and savings, covering nearly 79 per cent of all households and tracking more than UGX 2.7 trillion sent to programme cooperatives, of which UGX 2.5 trillion reached more than 2.5 million beneficiaries, with access restricted to named implementing institutions. The system itself is short of its design: the Auditor-General found two of seven pillar modules fully implemented, 178 parish tablets dead and none with internet connectivity, and one district reported half its tablets dead in September 2026.	MIXED the programme system is thick with data while the registry meant to unify it is silent
Zambia	A workshop brought five agencies and line ministries together and produced a draft roadmap and technical committee. 2025-09 — a US$100 million digital acceleration programme was approved, its interoperable and secure platforms pillar funding digital government services and data exchange. 2025-09-14 to 21 — a workshop in Kitwe brought the pension authority, the health insurance authority, the workers' compensation board, the disability agency, the state technology institute and line ministries together, producing a draft convergence roadmap and a technical committee to link the social protection systems. Naming the five bodies that have to connect is the useful part. A roadmap and a committee are not an exchange: no interface, data-sharing agreement or go-live date follows from either in the record.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zimbabwe	The social registry has a funded component for integration with the civil registry and other government data systems, and first-phase enumeration is complete. The first phase of enumeration for the social registry was completed in Mangwe district in December 2025 and extends to Nkayi and Mudzi, aiming at about 2 per cent of the population, roughly 80,000 households (project document). The survey was launched publicly in Nkayi district in March 2026 (launch). A proposed second phase would enumerate at least a further 4 per cent, about 160,000 households, with US$1.7m for enumeration and US$300,000 for IT and capacity building, the latter naming integration with civil registry systems and other government and partner data systems, platform upgrading and server hosting (project document). The registrar-general's own interoperability roadmap names social-benefit enrolment as a downstream trigger from birth registration (presentation). No integration is yet in operation: the interoperability is funded and described, not delivered.	MOVEMENT
