PROGRESS REPORT

Digital Identity and CRVS: progress report, October 2025 – October 2026

Edition of 2026-10-12 · compiled by Claude Opus from the documents in the Corpus repository

> *54 countries. Each row below is carried verbatim from that country's own progress report, which answers a fixed frame of indicators over the period; nothing is written here. A country not listed under an indicator has* **No evidence** *on it in its own report.*

ROBUSTNESS OF SYSTEM · REGISTRATION OF ENTIRE POPULATION · NATIONAL MAINTENANCE OF ID AND CREDENTIALS SYSTEMS · AUTHENTICATION · DIGITAL ID FROM BIRTH · INTEROPERABILITY OF BIRTH REGISTRATION AND DIGITAL ID · USE BY OTHER SYSTEMS

Progress values. *Movement* — some form of progress, however minor, has been recorded. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the repository holds a standing position and nothing in the period touched it. *No evidence* — the repository holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Movement, regulations still pending*.

The place reports do not share one window; the period above is the range they span.

Robustness of system

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	A unified national digital identity is issued and in use as a single credential across the government services portal. The credential was not on record at the window's opening. It is issued by the high commission for digitalisation and in use as a single credential across the national services portal; on 12 August 2026 the sports ministry integrated its own platforms into that portal so that holders reach them without separate registration. No enrolment count, assurance level, governing instrument or data-protection basis for the credential is held. It is running ahead of the digital-identity and trust-services law that has sat before the Assembly since November 2025, so what it legally is, and what a holder may refuse, is not established anywhere on file. 2026-10-09 - the digitalisation commission set out how the national digital identity is obtained, by registration and appointment at the commune, activation and verification against the holder's biometric data.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Angola	A tender opened for a US$28m national digital identity and electronic signature platform, separate from the card, which is now generated from the birth record. 2026-08-14 — the President authorised US$28m and formally opened a public tender for a National Digital Identity and Electronic Signatures Platform, specified to support up to 30 million digital identities and to let citizens, firms and public officials use a single digital credential for public services, digital contracts, electronic verification of customers and legally valid electronic signatures. It was named as a workstream in the 2024 loan agreement with nothing built. No supplier, timetable or relationship to the separately recorded public digital infrastructure contract is stated. The physical credential is distinct and unchanged: in issue nationwide and generated from the birth record by system interoperability, on a foreign-built platform running since 2017. What moved on it is its measurement and its proposed legal monopoly, both reported elsewhere in this report.	MOVEMENT
Benin	One presidency-attached agency is responsible for the identity, population and electoral registers, its director general also National Civil Registrar, issuing a card to the regional standard since 2020. The identification agency opened a tender for the architecture of a business-intelligence environment over its national identity data (tender). Analytics over an identity base raises questions of purpose limitation the tender notice does not answer. A single presidency-attached agency is responsible for identity, the population register and the electoral register, with its director general doubling as National Civil Registrar. The agency frames that as a structural decision rather than a technical one, and it has held since 2017. The card has been issued to the regional biometric standard since 2020 and remains so. Neither moved in the window, which is the point: the architecture is settled and what changed sits on top of it — issuance volumes, cross-border pilots and the services drawing on the register. The concentration is also the standing risk, and no source on this ledger records an independent audit, an oversight board or an appeal route against the agency.	MOVEMENT
Botswana	A biometric card is itemised at P31,700,000 in the new estimates, while card replacement has been delayed since the start of 2026 on staffing and ageing equipment. The labour and home affairs ministry is contending with a cartel producing fake identity documents (report). A document cartel is a statement about the credential's integrity, not only about production capacity. 2026-04-01 — the electronic identification programme was rescoped from a public-private partnership into a broader digital identity estate integrating a national wallet and electronic government services, with a biometric identity card itemised at P31,700,000, against a partnership prioritised the year before and not progressed. Against that, the physical system is failing. A parliamentary answer attributes replacement delays running since the start of 2026 to too few production staff and ageing equipment with frequent breakdowns, with no backlog figure, no restoration date and no equipment-replacement commitment. The legislative patch is in force and not working as intended: an amendment allows a passport or driving licence to serve while a card is replaced, and service providers are reported refusing even the replacement receipt. 2017 — IDEMIA's multi-biometric platform added facial recognition to fingerprint matching.	REGRESSED
Burkina Faso	A fifth-generation regional biometric card entered mass production in January 2026, issuable from age five and required from thirteen, at FCFA 3,500 with ten-year validity. 2025-12-02 — the card was launched with the head of state's own enrolment and has been in mass production since January 2026, issuable from age five and required from thirteen, at FCFA 3,500 with ten-year validity, carrying both national and confederal marks, and adopted by a second member state in March 2026, against harmonised regional specifications validated by three security ministers in November 2024 with the older card still in issue. No enrolment or issuance total has ever been published, so a credential required of everyone over thirteen has no coverage figure attached at any point in its life. It is a document rather than a digital identity: the electronic identifier that would authenticate its holder against a system is reported below and is not yet enrolled.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burundi	The biometric identity card was presented as technically ready in May 2026 and is waiting on the law or decree governing its use, piloted in about a dozen communes. 2026-05-07 — the card was presented as technically ready and awaiting the legal instrument governing its use, having been piloted in about a dozen communes. The starting position was a confirmation that it would not be ready for the 2025 voter enrolment. Whole-project cost is put at about BIF 15bn covering equipment, production centres and nationwide deployment, and BIF 16.0bn was proposed in the following year's draft budget. The order is deliberate: the government states that the data protection law came first in order to enable the card. What is still missing is the card's own instrument, an issuance figure and any statement of what it authenticates against.	MOVEMENT
Cameroon	4,000 free cards were delivered at Yaounde 5, some to people blocked for over fifteen years by duplicate-identity records. 2026-07-27 - 4,000 free cards were delivered in one district, some to recipients blocked for over fifteen years by duplicate-identity records, cleared by seconding police officers on site. The delivery was timed to public-service and police recruitment competitions, for which the card is a precondition. What it shows is a register carrying duplicate-identity records that block real people from real entitlements, and a remedy applied by posting officers to one district rather than by correcting the register. No count of blocked records, no national clearance programme and no deduplication figure has been published.	MOVEMENT
Cape Verde	The electronic identity and authentication platform operates behind the justice portal, supporting three authentication modes. The platform is operating as the state's e-identity layer behind the justice portal, supporting three authentication modes and serving as the interoperability layer between civil registration and identity through which every child is issued a unique identification number at birth. Its stated next phase is consolidating existing databases, expanding identity-enabled services and finding long-term financing models, carrying no date, instrument or budget line. That an identity platform doing this much work has no identified long-term financing model, and no appropriation traceable to it in a digital vote that fell by seven eighths across two budgets, is the position as the repository holds it.	NO CHANGE
Central African Republic	A US$13m digital identity system was announced with an implementation window of 2027 to 2032, while police at one prefecture are reported demanding FCFA 100,000 to 200,000 for a card whose legal price is FCFA 4,500. 2025-11-28 — a US$13m integrated system built around a unique identification number, managed by a new identification office and unifying existing biometric and civil-registration databases, was announced with an implementation window of 2027 to 2032 and assessments, procurement and an international tender still ahead. It is an announcement rather than delivery, and the account reads as a project communiqué. 2026-06-16 — the existing credential moved the other way. The legal tariff of FCFA 4,500, restored by interministerial order in June 2025 after five years of overcharging, holds on paper while at one prefecture police are reported to serve one religious group first and to demand FCFA 100,000 to 200,000 from another, requiring the father's and grandfather's birth certificates. The card is the gateway document for the electoral roll and most administrative access, so the movement is in access and price rather than in technology. The second document rail is unchanged: biometric passport issuance resumed under a new operator with payment funnelled through only two banks, and no volume, price or coverage record has been held since.	MIXED a national digital identity system announced for 2027 while access to the existing card is priced informally
Chad	The national biometric register concluded a real-time data-sharing agreement with the finance ministry, on a claim of single source of truth that is the agency's own. The register launched in 2020 on a French supplier's technology, and the single-source-of-truth claim is the agency's own and is not independently verified (register, refugees, agreement). Real-time sharing with the finance ministry, in a country with no data-protection statute and no supervisory authority, is a design decision nothing on record governs.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	A new supplier took over biometric document production on 31 March 2026, with data domiciled in the Comoros. A build-operate-transfer contract had run since 2007 with all Comorian biometric data stored in Belgium and one production machine, at Moroni. 2026-03-24 - the outgoing supplier handed the biometric data to the government, and on 31 March a new supplier formally succeeded it, with data domiciled in the Comoros, production decentralised to the two other islands and a polycarbonate laser-engraved data page with a compliant chip. Production was suspended from early to late March during the handover. Contract length, value and financing source are stated nowhere in the repository.	MOVEMENT
Congo	A secure digital identity framework and wallet are named again as a roadmap foundation, with no legal instrument, wallet or pilot on file. The framework was committed at a July 2025 workshop owned by the interior ministry, with a vendor cited and no legal or institutional framework adopted, the workshop's own case being that many citizens hold no valid identity document - asserted by the responsible ministry and not sized. 2026-07-28 - it was named again as one of three digital public infrastructure foundations, with still no legal instrument, no wallet and no pilot on file. Twelve months, two statements of intent and no instrument is the whole of the movement.	NO CHANGE
Cote d'Ivoire	The identification office publicly named historic duplicate identities inside the biometric register; the register itself is unchanged. The biometric register issued the national identification number at both ends of the window, with coverage unpublished. 2026-07-30 - the identification office's director general named historic duplicate identities inside the register publicly, and the office presented its identification work at ID4Africa in May 2026. What moved is disclosure, not the system: no deduplication programme, count of duplicates, remediation timetable or audit of the register has been published, and the statement reached the repository through a commentary piece rather than an official notice.	NO CHANGE what moved in the year is disclosure rather than the register
Djibouti	A biometric national identity card has been issued nationwide since 2025, with mobile enrolment kits. No biometric national identity card was on record at the window's opening. It is now issued nationwide with mobile enrolment kits, capturing fingerprints, iris, photograph and electronic signature against a national identification number held in the register of natural persons, the population directorate describing the register as the spine of a modernised and interconnected administration. No enrolment total, coverage rate or issuance figure is published at any date, so how far nationwide reaches is unestablished - and the prior-authorisation regime the Digital Code sets for national-identifier and biometric processing has no supervisory body on record to have applied it.	MOVEMENT
DR Congo	The national digital identity platform launched on 13 June 2026, valued at US$97.1m, with no enrolment figure published. At the window's opening a twenty-year exclusive electronic know-your-customer partnership signed in June 2025 was in phased deployment. 2026-06-13 - the platform launched at a state ceremony, valued at US$97.1m by the planning ministry, with US$2.6m raised by the concessionaire for initial rollout and rollout to begin with technical audits and pilot testing. No enrolment figure is published, and the financing was already unclear when the valuation was reported in January 2026.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Egypt	The regulator referred all four mobile operators to prosecution over lines registered without their holders' knowledge and expanded facial verification. The repository carries no position on mobile line registration at the window's opening. 2026-08-10 - the regulator referred all four operators to the Public Prosecution over lines registered without customers' knowledge, ordered them to halt new activations on corporate registration systems, contact every existing corporate-line holder to re-register in person by a deadline with unclaimed lines cancelled, and accelerate biometric verification, warning that non-compliance would cost them sale and activation rights. It followed reports of a nineteen-year-old sentenced in absentia to twenty-five years in a case turning on a line registered in his name. The regulator logged over 3,000 line-fraud complaints and 100,000 call-centre inquiries in two days, and public use of its line-checking service reached five million registrations in a week, roughly doubling its user base. Members asked what framework governs collection, storage and access to the facial-recognition data taken at registration, and researchers argue irreversible biometrics carry their own risk while the protection framework is still being built. 2014 - a contract with Morpho for a chip-embedded biometric identity card had yielded no card by May 2025; the 1996 barcode card still in use cannot hold biometrics.	REGRESSED
Equatorial Guinea	The passport portal was restored on a new host in July 2026 after a maintenance outage. The credential itself is regional and well specified: chip, machine-readable zone and issuance-control rules under the CEMAC passport regulation, with 7,706 issued through missions abroad between 2022 and 2026. The service around it is less so. The application portal went down for maintenance and was restored on a new host in July 2026, and only six overseas posts capture data with more pending.	MOVEMENT
Eritrea	The repository holds no operational foundational digital ID, a position profiled in July 2025 and untouched since. 2025-07-26 — a digital identity index profile found no operational foundational identity system and set out what one would face: low connectivity and mobile penetration, thin digital infrastructure, a telecom monopoly and weak civil registration. Nothing in the period changes that. No enrolment programme, procurement, pilot or legal instrument on digital identity appears on the ledger, so the standing position is carried forward on a single profile written just before the window opened.	NO CHANGE
Eswatini	Electronic identities are planned under the digital project for a 2027 rollout, and national card production resumed in February 2026 after a suspension from late September 2025. Electronic identities are planned for a 2027 rollout, on a readiness report first published in 2024 (plan, readiness). Production of the existing national card was suspended in late September 2025 and resumed on 22 February 2026; the card is not a digital identity (resumption, regulation). No cause, backlog figure or remediation is published for the five-month suspension. A credential system that stopped issuing for five months, in the same period its ministry published unblurred identity documents and missed the breach-notification duty, is the repository on which the 2027 electronic identity is to be built. 2026-09-16 — a network blackout halted identity card and passport processing at Home Affairs, with no offline procedure. 2026-09 - the Civil Service Commission found a suspended assistant regional civil registrar guilty of unlawfully processing a birth certificate and identity card in February 2024 for a foreign national, using a citizen's particulars; criminal proceedings continue.	MIXED electronic identity planned for 2027 while national card production was suspended for five months
Ethiopia	The programme adopted an open external assessment framework as one of its official monitoring mechanisms and re-ran it in May 2026. The assessment was first run in early 2025 and re-run in May 2026, and the identity programme has adopted it as one of its official monitoring mechanisms (assessment). The scores, findings and any remediation plan are not held, so the repository records that the system is being measured and not what the measurement says. The deployment is among the furthest advanced of the open-source platform it is built on (platform account).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Gabon	Almost a quarter of card enrolments are contested — 78,500 disputed files against 335,384 enrolled — and an administrative commission is to clear the nationality files blocking them. The figures are the finding: 335,384 enrolled, 164,944 cards produced, 147,224 collected, 92,614 files in processing and 78,500 disputed — about 23 per cent of all enrolments contested. 2026-04-01 - following a working session chaired by the justice minister with the identity directorate's director general, an administrative commission is to be set up to clear litigious files and pending procedures on nationality, specifically those blocking passport and national identity card applications, constituted under the February 2026 nationality code for one year renewable. The architecture the system rests on is deliberately partitioned: three foundational systems whose underlying databases are to be technically, logically and architecturally separate because their purposes and eligible populations differ and to protect personal data, while sharing common underlying infrastructure. Robustness here is being tested at the nationality end, not the technical one.	MOVEMENT
Gambia	The identity system went live in June 2026 on a data centre inside the country, two years after bidding opened. Bidding for the national identification documents and digital identity systems opened in July 2024 on a design-build-transfer basis and closed that August. The first card was issued in June 2026 with a national identity data centre inaugurated at Abuko, hosted on Gambian soil. No enrolment figure, uptime statement or independent assessment of the system has been published.	MOVEMENT
Ghana	The system runs a distributed real-time architecture with about four-second biometric verification, and every district office was suspended for security updates. The authority's own technical synopsis describes a decentralised, distributed real-time architecture protected by public key infrastructure, biometric verification at about four seconds, and central storage sized for 40 million facial, 80 million iris and 400 million fingerprint templates, delivered under a public-private partnership. It is the clearest architecture statement held and it dates from 2018. 2026-04-23 - services were suspended at every district office nationwide while the public key infrastructure team carried out system updates described as a critical security measure, with restoration expected on 10 May 2026. No confirmation of restoration, and no availability or uptime figure, is held. No penetration test, audit or incident record for the system appears on this ledger.	MIXED the architecture is documented while services were suspended nationwide for security updates
Guinea	A unique personal identification number is stated to be being put in place, with no instrument, issuing authority or format on record. The statement was made by the territorial administration minister at a commemorative event in August 2026, alongside digitalisation of the civil-status system, and is not an instrument (statement). The unified civil-service payroll system, officially launched in November 2025, has still to take in a unique personal identification number, which the Prime Minister said it must integrate (payroll system).	MOVEMENT
Guinea-Bissau	A third production centre in Biombo took the national network to 18, and the ECOWAS credential reached first field issuance. 2026-02-11 — the contractor Semlex announced a production centre opened at Safim in Biombo on 30 January 2026, the third in that region and rated at 100 cards a day, bringing the national network to 18 biometric identity production centres, with further centres planned for Sao Domingos and Bolama. 2026-03-16 — the ECOWAS biometric card was issued in the field for the first time the repository records, 262 cards to women cross-border traders in Sao Domingos. Beneath both is a standing position of a functional biometric national identity card system, with Guinea-Bissau one of six ECOWAS states to have fully operationalised the regional credential. What the ledger does not hold is an enrolment total, a coverage rate, an authentication service or any legal instrument governing the system: the movement is in production capacity, not in what the credential does.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Kenya	The digital identity rollout was ruled on by the High Court in August 2024; no audit or availability figure is held. A constitutional petition against the rollout of the digital identity system was ruled on by the High Court in August 2024 (ruling). The directorate responsible was renamed in 2025 and mandated to manage, maintain and operate the integrated population register (directorate). What the repository does not hold on this indicator is any security audit, penetration test, availability figure, incident record or continuity plan for the identity system. The evidence available is litigation and a mandate, neither of which speaks to whether the system works under load.	NO CHANGE a ruling on the challenge with the system unchanged
Lesotho	The National Identification System is in operation, and the most recent account held of it is a case study published in 2022. The system is recorded as in operation, documented in a World Bank GovTech case study of 2022 and in the same institution's service-delivery study of that year (case study, service delivery). No later coverage, enrolment or performance figure is held, and the independent research on digital identity in the country dates from 2021 (research).	NO CHANGE
Liberia	Card issuance was suspended for more than six months while institutions continued to require the card. In March 2026 the Senate referred the suspension of national identity card issuance to committee and summoned the registry's leadership, on the ground that banks and other institutions treat the card as mandatory identification. Four months later the Senate summoned the registry again, unanimously, on the contradiction that the state had suspended issuance for more than six months while its own regulated institutions refused expired cards for banking and mobile money. The registry had earlier put arrears of US$1.7m owed to its systems vendor on the record. 2026-09-08 - the replacement of the system is signed and cannot start. A US$54.7 million concession with an Austrian supplier is signed but implementation cannot begin until legislative ratification and other legal requirements are completed, the identification registry's executive director said. The project as described covers biometric enrolment and deduplication, digital and physical credentials and an integrated identity platform beyond cards. No signature date is stated, so no deal record was built, and no legislative timetable, concession term or data-custody arrangement is published. 2026-09-16 — the registry appealed to the legislature to ratify the US$54.7m build-operate-transfer agreement with its Austrian supplier; nothing can start until it does.	REGRESSED
Libya	Enforcement in 2026 revoked 225 national identification numbers and passports and suspended 61 family records, with a trade in forged numbers still reported. The attorney general's office suspended 61 family records and revoked 225 national identification numbers and passports in January 2026 (enforcement); ten further numbers were cancelled at Al-Marj the same month (cancellations). A trade in forged national numbers was still being reported in April 2026 (trade), and parliament had warned of breaches in the civil registry system in December 2025 (warning). No count of fraudulent numbers in circulation and no remediation programme is published. An independent analysis built on 66 official publications of the Attorney General's office to April 2026 found 278,969 nationality files exposed to forgery over a 43-year window, with 10,620 families and more than 4,000 individuals implicated, and named five mechanisms including direct manipulation of the registry database (analysis). 2026-09 - 3,090 national numbers issued on forged records at one registry office were halted. 2026-09-26 - the public prosecutor announced a further case of civil-status data falsified for 76,000 dinars, the forged-number count standing above 89,000 in the last official tally.	REGRESSED
Madagascar	The identity management system has not entered mass-enrolment production and cannot be judged robust before its commissioned audits report. Terms of reference issued in March 2026 commission a two-phase technical and security audit of the national identity management system, covering architecture, security posture, scalability, resilience, continuity and incident management (terms). They state that biometric enrolment equipment is technically installed but the system has not entered mass-enrolment production, and that pre-enrolment and post-pilot audits are required before robustness can be judged. That is the whole of what the repository holds on the question. No audit finding, penetration test, availability figure or incident record has been published.	NO CHANGE an audit commissioned and not yet reported

COUNTRY	DEVELOPMENTS	PROGRESS
Malawi	Offline verification authenticated more than 1.2 million farmers; the register moved to the national data centre. The bureau's own plan is the repository's fullest account of the architecture: biometric deduplication, public-key infrastructure and security controls, 99 per cent of adults biometrically registered, and stated resilience and integration gaps. Nothing independent tests that coverage claim. 2026-01 - the servers were relocated to the national data centre between 9 and 13 January, with identity issuance and verification paused for four days. A four-day national outage with no fallback described is a resilience fact as much as the relocation is. 2026-07 - offline code-based verification authenticated more than 1.2 million farmers, and a campaign synchronised 970,400 birth records into the central database.	MOVEMENT
Mali	Five document categories are issued on the confederation biometric passport to international specification, under specifications validated by three security ministers. The three states' security ministers validated harmonised travel and identity document specifications at Bamako in November 2024 and referred them to the heads of state (specifications, validation). The common biometric passport launched in January 2025 (launch) and five categories are now issued to international civil aviation specification on a five-year, thirty-four-page book (categories, supplier). No issuance count, rejection rate or verification figure is published.	MOVEMENT
Mauritania	The national identity application serves about 1.5 million citizens and 554,027 remote services, and a full day of maintenance on 8 August 2026 took all of it down together. The application launched in 2024 on a vendor identity platform carrying document extracts and passport requests (launch, pilot). It is in use by about 1.5 million citizens for 554,027 remote services and is the identity-verification backbone for the state services portal's fifteen-plus services and for private financial applications (usage, account). A full day of scheduled maintenance on 8 August 2026 took all of it down at once; no operator statement on the outage or on redundancy is held (outage). A single point of failure carrying that many dependent services is the finding here, and the repository holds no continuity arrangement for it.	MIXED about 1.5 million users and half a million remote services against a full day of scheduled maintenance taking every dependent service down at once
Mauritius	The national authentication framework was put to an independent security audit tendered in October 2025. The identity card regulations of February 2024 set the terms on which the card and the mobile identity are issued and read (regulations). A consultancy firm was sought in October 2025 for an independent information-technology security audit of the national authentication framework (notice). The servers the framework runs on are inside a separate procurement, alongside a sovereign cloud market sounding (clarification). The audit was commissioned; no finding, availability figure or incident record from it is held.	MOVEMENT
Morocco	The national digital identity application reached 2.5m users and over 7m transactions by September 2025, accelerated after attacks on three state bodies. Adoption was fast-tracked after cyberattacks on the social security fund, the justice ministry and the land registry (acceleration). Usage stood at 2.5m users and more than 7m transactions since April 2022, and by February 2026 the same identity authenticates the national digital wallet (partnership). It is vendor-built on an existing identity platform, and no availability, failure or fraud measure is published for it.	MOVEMENT
Mozambique	Updated civil identification regulations were approved in 2026 governing collection, processing and retention, and the biometric passport takes applications by electronic pre-booking. The regulations under the 2022 identification law were updated and approved by the Council of Ministers, governing collection, processing, management and retention of civil identification data and standardising issuance; the instrument is not held and its provisions rest on a spokesperson's description (regulations, framework). The biometric passport is in issue with applications submitted by electronic pre-booking, named as the principal documentary-security measure at the migration service's anniversary; no dates, volumes or coverage figures are given (passport).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Namibia	A chipped electronic identity card with a ten-year validity missed its September 2026 rollout for want of a finalised legal framework, and is to carry a randomly generated number for first-time applicants. The card holds biometric and biographical data plus a digital identity component for remote authentication, with a thumbprint, a facial image and a personal identification number issued as on a bank card, and is valid for ten years against the indefinite lifespan of the document it replaces; a July 2026 launch was announced and slipped, cabinet approved the card in 2023, and none had been issued by August 2026 (card, announcement, validity). Identity numbers had been derived from date of birth; first-time applicants will get a random number, with legacy numbers retained on the reverse of the card and existing documents valid until withdrawn by gazette notice (number, account). The register is already load-bearing for payments, and it failed in June 2026: 15,825 old-age grants were suspended because the beneficiaries' names could not be verified against the national population registry, and pensioners were turned away at pay points before the ministry stated that those affected had either missed the notice or were dead (suspensions). 2026-10-08 - a trade publication reported the electronic identity card's September rollout delayed because the legal framework had not been finalised, as two ministries briefed Parliament.	STALLED
Niger	A confederation biometric identity card entered mass enrolment in April 2026 capturing fingerprint, face, voice and iris, and a biometric passport opened enrolment in July. The card is mandatory at fifteen and over, valid five years at 4,500 FCFA, and mass enrolment began on 25 April 2026 across the capital's twenty police stations (enrolment, rollout, sovereignty). The passport opened enrolment on 16 July 2026 with the president the first enrollee, five categories issued to international civil aviation specification over thirty-four pages (passport, editorial, enrolment start). Four biometric modalities on a mandatory card, with no published supervisory record from the data protection authority, is the shape a named analyst warns about. 2026-09-15 - mass enrolment for the confederal passport opens at 45,000 FCFA, ECOWAS enrolment having closed. 2026-09-15 — mass enrolment for the confederation biometric passport opened in Niamey.	MOVEMENT
Nigeria	117.5m people hold a number of 134.6m enrolments at 30 June 2026 against a 180m December target, and corrections are confined to a smartphone portal excluding about 72 per cent of adults. A 2024 policy confined corrections to a device-locked smartphone self-service portal, excluding the about 72 per cent of adults without smartphones and enabling agent charges of ₦12,000 to ₦62,000 against an official ₦2,000 (corrections); validly issued numbers are also being suspended over enrolment-centre bypass with reinstatement fees pushed onto citizens (corrections, regime). 2026-09-07 - the lender's own implementation report separates two counts the repository had been carrying as one: 117,493,554 people hold a number out of 134,553,120 enrolments at 30 June 2026, from a 36,894,074 baseline of October 2019, against a target of 180,000,000 by December 2026, with females holding 40,424,403 of the numbers issued. Closing the gap would need monthly enrolment to rise from 1.5-1.8 million to about 7.4 million in the remaining six months. The commission's own figure of about 140 million, given to a publishers' roundtable in Lagos, is neither number and is not reconciled with either. 2026-09-16 — the government set December 2026 for 95 per cent identity number coverage.	MIXED the count is now split between enrolments and numbers issued while corrections stay behind a portal most adults cannot reach
Rwanda	The single digital identity adds iris to face and fingerprints, and the consent and access-log layer has no stated go-live. Nationwide registration launched in August 2025 and the capture now runs iris alongside face and fingerprints (identity, registration, deadline). The consent and access-log layer is described as such with no go-live stated. It is the load-bearing safeguard in the design — the thing that would let a person see who has read their record — and it is the one component with no delivery evidence at all (layer, progress). A system that adds a third biometric modality faster than it adds the log of who queries it has ordered its work in a particular way, and the statutory sunset of legacy documents falls before the safeguard is evidenced.	MIXED iris added to a three-modality biometric capture while the consent and access-log layer has no delivery evidence

COUNTRY	DEVELOPMENTS	PROGRESS
Sao Tome and Principe	A foundational digital identity on an open-source platform has live prototypes for credentials, data exchange, portal and electronic signature, and no source confirms the card itself has launched. A system integrator is engaged with the identity institute and the registries directorate, with prototypes live and a roadmap running January to May 2026 (pilot, mission). No source held confirms the foundational card has launched, and the roadmap's delivery is not confirmed either. The identification law that would govern it was flagged as urgent in 2025 and has not passed. So the components exist as prototypes, the statute does not exist, and whether the thing itself is issued is unestablished.	MOVEMENT
Senegal	Identity card production resumed on 1 April 2026 after a ransomware breach forced a two-month suspension, and exfiltration is unrebutted. Production was suspended on 5 February 2026 and resumed on 1 April (suspension, resumption). Exfiltration is unrebutted: the directorate's communiqués assert integrity only, never confidentiality. The volume claim appears as both 139 GB and 139 TB across one actor's two artefacts, so even the size of the loss is unestablished (breach). 2026-09-24 - the directorate's head confirmed that the incident was a cyberattack and said no personal data was compromised; no technical accounting accompanies the statement. The data-protection law did not move through the breach, and no technical accounting has been published. 2026-09-29 - the interior minister confirmed the attack on the directorate to deputies and said a general security audit had been engaged; no auditor, scope or date is given.	NO CHANGE
Seychelles	A national digital identity platform runs a two-tier credential built on a foreign vendor's platform, and no source addresses licensing, hosting or exit terms. The platform launched in September 2024 on a foreign vendor's identity platform, with the credential made mandatory for work permit holders (platform, mandate, civil status). The sovereignty question is open: no source addresses licensing, hosting or exit terms with the vendor. For a national identity credential that is the arrangement that matters most, and it is the one thing nothing published says. No enrolment count, coverage figure or authentication volume is held at any date.	NO CHANGE
Sierra Leone	An open-source migration of the identity system completed pilot and is still seeking funding, while a second national digital identity platform went to private-sector consultation. The migration pilot is complete and full implementation is still seeking funding (migration, identity first). A separate platform is being built with a foreign government and a foundation, and went to private-sector consultation on a trusted digital identity framework in August 2026 (consultation, dialogue, partnership). The identity agency has warned publicly against parallel identity systems, so the duplication is contested inside government rather than merely observed from outside. One route is funded and unbuilt, the other piloted and unfunded.	MIXED an open-source migration piloted and unfunded while a second identity platform is being built and the identity agency warns against parallel systems
Somalia	A mobile identity application passed 50,000 downloads on a renewed adoption call, and a consent-based verification platform runs alongside it. The adoption call was renewed in August 2026 with the application past 50,000 downloads, against about 2m registrations (adoption, application, tools). The gap between registrations and downloads is the finding: the credential is being issued considerably faster than the means of using it is being taken up. A consent-based verification platform launched alongside the application and a certificate delivery system, and nothing has entered the repository about it since (verification).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
South Africa	Every stated date moved: hosting is now 31 March 2027 and credentials 2027/28, and the digital driving licence's nearest milestone is March 2027. The plan's only target for 2026/27 is the hosting infrastructure itself, with verifiable credentials via a digital wallet in 2027/28 and digital identity and e-passports by 2029. Core identity and PKI infrastructure is to be hosted within the revenue service's environment, with the central bank integrating on payments and know-your-customer checks, and facial recognition primary with fingerprints secondary. The digital driving licence moved the same way: promised for 2026, its nearest dated milestone is now March 2027. About 300,000 identity documents are blocked behind court orders where duplicates or people illegally in the country were detected, and the minister puts the great majority of identity-theft cases on the manual green identity book, still held by about 16 million people (minister). 2026-09-23 - home affairs was investigating 21 cases of identity theft and fraudulently acquired identity documents, flagged through biometric checks against the population register. 2026-10-01 - the home affairs minister showed the first working digital identity credential; no public release date was given. 2026-10-06 - the home affairs department's quarterly report records a missed target to start procuring digital ID hosting infrastructure. 2026-10-06 - the transport department said a Presidency-led group is exploring digital licences within the digital identity framework.	STALLED
South Sudan	A unified national digital identity system was announced for every citizen aged 18 and over, against a base in which close to 90 per cent of the population holds no government-recognised identification. The announcement came in July 2026 alongside the civil registry plan (announcement, records). Five machine systems were delivered in May 2026, two for passports and three for identity and nationality documents (machines). The production capacity is therefore arriving before the statute, the data-protection law, the register design and the fee structure that would decide who can actually use it.	MOVEMENT
Sudan	The national digital identity has begun banking-sector linkage, and no enrolment count is held while bank accounts are conditioned on it. The credential launched in May 2025 and banking-sector linkage began in August 2026, its scope publicly bounded at the same time (launch, linkage, bank data). Tying bank-account continuity to a credential whose coverage is unmeasured is the exclusion risk the repository recorded before launch (trust, recovery). The electronic know-your-customer route announced by the ministry and the central bank in August 2026 is that risk being realised rather than answered: it makes the credential the condition of keeping an account current, in a country where displacement is mass and the coverage figure is still unpublished (eKYC). It has also been integrated with the trade registry (registry). No enrolment count is held at any date.	MIXED a national credential launched and tied to bank-account continuity while its coverage is unpublished in a country of mass displacement
Tanzania	The authority published tenders for iris and facial recognition contractors for a second expansion phase, and identity card printing stays centralised after a request to print in Zanzibar was declined on security grounds. Two independent parliamentary accounts agree on the expansion's scope (tenders, expansion). The government declined a request to print identity cards in Zanzibar on security grounds; passports are printed there and identity cards are not (printing). A free short-code service was launched for checking identity status by message (status). Adding iris and face to a register already connected to more than 138 institutions is an expansion of what can be matched, and no data-protection assessment for it is on file.	MOVEMENT
Togo	Robustness rests on a 2023 proof of concept; no uptime, matching-accuracy or audit figure has ever been published. The proof of concept of 4 October to 4 November 2023, over at least 2,000 people across Greater Lome and three regions, tested the vendor's ability to deploy and configure the platform, the country-specific customisations, number generation with its security options, biometric validation and deduplication, code conformity, the enrolment kits and offline operation and battery autonomy. Resilience provisions are stated concretely: a fifth biometric kit held as backup, a generator per team, a help desk, a signed consent form before capture and a daily incident report. Operating rules bearing on register integrity are on record too — double enrolment strictly forbidden even where a card has not arrived, non-receipt handled through a freephone rather than re-registration.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Tunisia	No biometric identity card had been issued as at May 2025, against use targeted for the first half of 2025; nothing later confirms issuance has begun. What is missing is an interior ministry statement, an issuance figure or a gazette notice. The enabling organic laws passed in March 2024 and use was targeted for the first half of 2025; an assessment written in May 2025 records that the interior ministry had not begun issuing the card, and nothing later states whether it has (target, bills). Interior ministry figures for identity and travel documents issued through digital services were given in August 2026 as a ministry statement rather than a published series, with the passport figure given as several thousand without a number (figures). A biometric credential programme eight years in the making, with no card on record as issued, is the gap at the centre of this unit's identity record.	NO CHANGE
Uganda	Over 28m legacy records migrated in the platform's first brownfield migration, while the enhanced card machine-readable code does not work and has not since at least February 2026. The migration completed with about 200,000 duplicates found over seven months (migration, brownfield, renewals, modules). The code failure was raised in Parliament in August 2026 and has stood since at least February with no published fix date and no count of affected cards. Parliament's own record has the registration authority acknowledging in February that the functionality had not been integrated into its digital operational system and promising a fix by 31 March (failure, codes, problems). 2026-09-09 - one mobile operator is the only partner fully onboarded to the information-exchange module opened in March, so new cards fail at banks and SIM counters. A register data-breach investigation was opened with the protection office and police in September 2025 with no outcome, and a civil-society body demanded a fully independent inquiry (breach).	MIXED more than 28m legacy records migrated to a new platform while the new cards' machine-readable codes do not work
Zambia	The integrated registration information system reports end-to-end automation of birth and death notification under way, and the three enrolment figures held do not reconcile — a later source carrying a lower figure than an earlier one with no revision reported. A later source carrying a lower figure than an earlier one, with no revision reported by any party, is the reconciliation problem stated plainly (system, safeguards, enrolment). Procurement of an international system integrator for an open-standards identity build opened in March 2026; the card is to carry registration-card functions plus travel and private-sector service access, and delivery dates diverge between the state ICT institute and the Registrar General (procurement, training, advance). Two agencies giving different delivery dates for one credential is worth recording as the coordination question it is. 2026-09-19 - national identity documents have been invalidated for people the government accuses of campaigning to discredit it abroad, confirmed not by any official announcement but by a former deputy minister of home affairs defending the measure. How many are affected and under what legal process is unstated: no statute, notice or appeal route is given, and no government statement is on file. 2026-10-01 - re-evaluation of the bids to deploy and integrate the identity and civil registration modules was complete at June 2026, awaiting the lender's review.	NO CHANGE
Zimbabwe	A national digital identity was announced in May 2025 for a July 2025 start with no start recorded, and every claim about it in the repository is relayed second-hand. No start is recorded and every claim is second-hand (identity, denial). Population registry modernisation began around 2023; the registrar-general states personnel are trained and materials in place, and no independent confirmation is held (modernisation). A digital identity announced fifteen months ago for a start that never happened, evidenced only at second hand, is the position — in a unit that has a licensing regime for data controllers and a certification fee for their officers.	STALLED

Registration of entire population

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	Citizens resident abroad may apply for a biometric identity card after consular registration; no domestic coverage figure is held. The only account of identity registration outside the country: citizens permanently resident abroad may apply for a biometric national identity card after completing consular registration, an applicant holding a biometric passport and a national identification number applying online and one without them through the consular post. No issuance volume, processing time or fee is stated. The repository holds no enrolment or coverage figure for the identity system at home either - no count of national identification numbers issued, no share of the population holding a biometric card, and no registration rate. What it holds is a set of live systems announced without volumes, which is the shape of this country's govtech record generally. Refugees and asylum seekers sit outside it entirely: the agency's multi-year strategy records that Algeria still has no national refugee law, and registration runs on the agency's own case management system rather than a state register.	NO CHANGE a first stated position with no earlier account behind it
Angola	The census put card coverage at 52.4% of those aged five and over, leaving 14.9m undocumented, against a universalisation plan now printing in all 21 provinces. 2025-11-26 — the first national coverage figure the repository holds puts 52.4% of the population aged five and over as holding the card, 63% urban against 30.9% rural, leaving 14.9m people undocumented, drawn from the 2024 census definitive results. Issuance capacity did move. A universalisation programme runs printing posts in all 21 provincial capitals with two to three printers per province planned, mobile brigades in remote municipalities and three phases covering unregistered adults, cards at birth and replacement of degraded documents; one provincial campaign issued and delivered more than 4,000 cards in 16 days in a single municipality, and the ministry has been opening identification posts through the year. Collection is the leak. More than 120,000 issued cards were awaiting collection at identification posts nationwide in July 2026, the first such figure held and with no prior series to read it against. 2026-09-24 — the registries director put cards issued at home and in the diaspora at 17,166,000, with daily production capacity raised from 12,000 to 60,000 and a target of a card for every adult in the civil registry by December 2026. It is a cumulative issuance count, not a coverage rate.	MOVEMENT on issuance capacity, with coverage measured for the first time rather than raised
Benin	Biometric enrolment stands at about 98-99% with 7.7m identification numbers issued, while a charity issued 130,000 free cards and found dead enrolment numbers. The 2017 identification law created the agency and a unique personal identifier reaching about 10m people in six months; a World Bank-supported programme added 2.2m more, lifting biometric enrolment to about 98-99%, with 7.7m personal identification numbers and 6.1m certificates issued free, the system being described as increasing access to services. The gap between enrolment and a card in hand is what the window exposed. 2026-05-18 — a non-governmental organisation issued more than 130,000 free cards across nine communes in eight months on an electoral-participation rationale, and in doing so found failed fingerprints and dead enrolment numbers left by the earlier campaign. So near-universal enrolment and incomplete issuance sit together, and the defect was surfaced by a charity doing the state's distribution rather than by the agency's own reporting.	MOVEMENT in issuance rather than in coverage
Botswana	86.7% of people aged 15 and over held an Omang at the 2022 census, about 200,000 eligible citizens unregistered; an electronic identity card was piloted and remains at feasibility. 1986-12-24 — the National Registration Act establishes the register, its contents and the registration requirement. 2025-11-25 — a feasibility study supported by the African Development Bank and a pilot of electronic identity card production were announced in Parliament. 2022 — the population and housing census found 86.7% of people aged 15 and over holding an Omang, leaving about 200,000 of 1.5 million eligible citizens unregistered, most in the sparsely populated western districts and among San communities. No later coverage figure is held.	NO CHANGE with an electronic product still at feasibility

COUNTRY	DEVELOPMENTS	PROGRESS
Burkina Faso	The Council of Ministers adopted the decree organising nationwide biometric enrolment on 30 July 2026. The Council of Ministers adopted on 30 July 2026 the decree organising nationwide mass biometric enrolment for the unique electronic identifier of the natural person under the WURI project, with fingerprint and iris collection under public control, moving the 2024 identification statute, adopted on 11 October and promulgated by Decree 2024-1261 of 28 October in thirty-four articles, from legal framework toward rollout. No enrolment has been reported started, and no target population, timetable or budget is held. 2026-09-09 - the national identification office launched special operations to issue the confederal biometric identity card at Koudougou, ahead of the seventh International Identity Day on 16 September. No enrolment target, issuance count, fee, site list or completion date is published, and the card's technical specifications have not been published by the confederation. 2026-09-15 - demand in the capital outran the main centre: the office added nine enrolment sites across Ouagadougou for the confederal card and set delivery at 48 hours for an operation running to 16 September. The report relays the office's communiqué and gives no enrolment figure. 2026-10-09 - the digital-transition minister said enrolment for the digital identity, budgeted at over FCFA 40bn, was due to start in October 2026.	MOVEMENT
Burundi	83.5 per cent of under-fives were registered at the last national survey; thirteen communes now hold a biometric registration system. The third demographic and health survey puts 83.5 per cent of children under five registered with the civil-status authority, 83.7 per cent of boys and 83.3 per cent of girls, reported against the sustainable development goal indicator. It is the primary national statistical publication of the figure and it is now nine years old. 2026-08-10 — the territorial administration directorate set out digitalisation of civil status in pilot communes with decentralisation to zone level, and a UN agency stated that thirteen communes already have a biometric registration system. What has not been published is any updated national coverage rate, so the repository can date the machinery and not the population it has reached.	MOVEMENT
Cameroon	A second production centre opened at Garoua in August 2025, running at about 2,000 cards a day. Issuance ran from a single production centre at the window's opening, the new card having entered issuance in March 2025. 2025-08-07 - a second centre opened at Garoua at about 2,000 cards a day, with a displacement-response enrolment track. No enrolment total, coverage rate or backlog figure has been published at either end, so production capacity is the only measure of registration the repository holds - and capacity is not coverage. 2026-09-15 — a youth identity and employment platform was contracted: a three-year partnership to digitise and unify access to employment and training for 15- to 35-year-olds. No system, budget or delivery date is published.	MOVEMENT
Cape Verde	The national identification card keeps its 2014 legal basis and 2018 launch design, now produced domestically and renewable online. The card is a polycarbonate electronic card created by decree in 2014, with fee regime, biometric capture rules and validity period set by later instruments, its chip carrying identification, authentication and digital-signature applications, officially launched in January 2018. Same design and legal basis, now renewable online through the justice portal and produced domestically. No issuance total, coverage rate or holder count is held from any date, so how much of the population carries it is unestablished - which the birth-registration figure recorded elsewhere in this report should not be read as answering.	NO CHANGE
Central African Republic	A late birth-registration campaign reports 61,000 additional registrations in the capital prefecture. 2026-01-29 - a campaign run by the territorial administration ministry with a European partner reports 61,000 additional registrations in the capital prefecture. It is late registration of people already born rather than registration at birth. The step behind any wider effort is being scoped rather than taken: a national physical-archiving expert was recruited to diagnose civil-registry archive holdings across registry centres, courts, health facilities and justice bodies. No national registration rate, no total registered and no target appears on this ledger.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Chad	The identity system assigns a unique number to every enrolled resident across 29 centres, against 3 per cent holding cards at appraisal. The agency's own site states that its integrated population and secure-documents system, after enrolment and deduplication, assigns every enrolled individual a unique national identification number, including refugees and residents in transit, across 29 centres (agency); the appraisal put only three per cent of Chadians holding a national identity card (appraisal). Reach has been extended by decision rather than by campaign: agents posted permanently in embassies from September 2025 (diaspora), Sudanese refugees enrolled at Abeche from 21 November 2025 (refugees), and a memorandum of 7 May 2026 covering returnees, displaced people and migrants (memorandum).	MOVEMENT
Comoros	The personal identification number's technical, legal and institutional framework was validated at a Moroni workshop. The number was provided for by the law of 27 July 2023 with nothing on record being built. 2026-03 - preparatory studies were validated at a Moroni workshop and the framework agreed, the number designated the cornerstone of citizen identity with interoperability to other state systems specified. No issuance date, coverage target or numbering scheme is published. A cornerstone identifier validated on paper, in a country whose civil-registry agency exists in law and not in fact, is as far as the identity layer has reached.	MOVEMENT
Congo	Production of the biometric unique-identifier card was relaunched, after a proximity distribution campaign for uncollected cards. Production was halted at the window's opening, with 10,506 identity cards and 25,549 number cards uncollected in one city alone, prompting a proximity distribution campaign. 2025-10 - production was relaunched. The prior suspension is inferred from the word relaunch: no suspension date, cause or duration is on file, and no national coverage or issuance figure exists at either end of the window, so what moved is production capacity rather than any measured count of people registered.	MOVEMENT
Cote d'Ivoire	The regional identification project's enrolment figures did not move, and the residence-card exchange has gone unreported since 2017. Health-insurance enrolment under the regional identification project stands at about 60%, on a status report archived in May 2025 that nothing later has replaced. The biometric residence card for foreign nationals has been issued since 14 August 2017, storing fingerprints and facial images, with holders of non-biometric cards required to exchange them. Nothing on file since 2017 reports issuance volumes or completion of that exchange. No registration rate, coverage figure or enrolment series for the population as a whole is published by any Ivorian body.	NO CHANGE
Djibouti	A biometric identity card is issued nationwide against a register whose enrolment total has never been published. The statutory basis stands: the register of natural persons is the unique reference for identifying individuals and producing every secure national document, with the identification number assigned from birth and compulsory across public, parapublic and private administration. The card built on it is issued nationwide with mobile enrolment kits where none was on record when the period opened. No enrolment total, coverage rate or issuance figure is published at any date, so how much of the population is registered is not established. The 2024 census counted the population but is a different exercise from registration.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
DR Congo	The identification office held its first board meeting and adopted a roadmap to accelerate registration (roadmap). 2026-05-29 - the office announced the start of operations as imminent with the partner withheld, the 2026 finance law giving national-identification acquisition FC 20,654,178 and revised provisions sitting in a supplementary budget before the Assembly. The last national identification was in 1984 and no enrolment figure is held. 2026-08-17 - separately, forty agents finished training at Gbadolite for a provincial operation identifying Mbororo herders, on a digital tool recording identity, ties to the country, weapons and cattle, with no legal basis, retention rule or data controller stated. 2026-09-12 — the diaspora ministry said an OKAPI card for Congolese by origin holding another nationality is in place and a diaspora digital identification system is being developed, with no issuing body or launch date. 2026-09-13 — the population is to be counted twice at once: an identification operation launches in mid-December 2026 under one ministry while a census is planned for 2027 under another, the office declaring its preparations complete on 16 September, with the data protection authority not installed. 2026-09-27 - the minister delegate for the diaspora launched the pilot phase of diaspora identification in Paris and presented the registration platform in Brussels.	MOVEMENT
Egypt	Electronic registration of births and deaths is stated as taken nationwide, and civil-registry kiosks stand at sixteen locations. The repository carries no statement on electronic civil registration coverage at the window's opening. The health ministry and associated bodies are stated to have taken electronic registration of births and deaths nationwide, credited with faster and more accurate demographic monitoring. Nationwide is the plan's own word: no coverage rate, completeness figure or target date is reported, the plan document is not held, and the claim is uncorroborated. The sixteen mall-based kiosks across six governorates and the airport, issuing birth, death, marriage and divorce certificates and identity application forms on fingerprint or facial verification and paid in cash, are unchanged, with no expansion, transaction count or withdrawal recorded.	MOVEMENT
Equatorial Guinea	The biometric identity document is issued from a central agency, with a 2025 national tour reporting 7,670 dossiers obtained and 7,275 processed. Issuance takes about 30 days for the identity document and 14 to 17 days for a passport, and the tour figures remain the most recent held (tour, agency). The executive has invited parents to register children and adults over 18 to obtain the document (invitation). There is no digital identity: the World Bank diagnostic records a 2018 digital civil-registry pilot only and recommends building one, and nothing has been built since (diagnostic).	NO CHANGE
Eritrea	With no foundational digital system in service, the credential is a card issued since 1992, handwritten until 2014. The same 2025-07-26 profile that finds no operational foundational identity system names weak civil registration among the barriers a future one would face, which is the nearest the repository comes to a statement about coverage. No enrolment figure exists to report, because there is nothing to enrol into. The population counting the repository does hold is the survey work reported under Censuses and surveys, which is a statistical exercise and not a register. The credential that does exist is documented: identity cards are issued by the Department of Immigration and Nationality, were first issued in 1992 and were handwritten until 2014, with applicants submitting a municipality letter, a birth certificate and proof of citizenship to one of twelve branch offices which forward the application to headquarters for approval. A newer electronic card carries a laser-engraved photograph, the holder's fingerprint and a unique serial number, and citizens aged 18 and over are required to hold one. No issuance volume, coverage rate or database behind the card is on record at any date, and the fullest account of the system is eight years old.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eswatini	Birth registration completeness reached 61 per cent in 2025 and death registration 62 per cent, against 8.3 and 26.5 per cent in 2016. The 2022 annual vital statistics report put completeness at 35.6 per cent of births and 55 per cent of deaths (report). The 2025 figures announced at the ninth Africa civil registration day are 61 per cent of births and 62 per cent of deaths, against 8.3 and 26.5 per cent in 2016 (commemoration). The 2025 report itself is not held as a downloadable government publication. The population register is a compulsory register of every birth, marriage and death since 1984, and is a paper-based statute not shown to be digitised. The 2027 census is the next whole-population count, with household mapping begun and E130.5 million allocated. Two in five births are still unregistered.	MOVEMENT
Ethiopia	Enrolment reached 49.1m by August 2026 from 16.4m in June 2025, on 12,000 registration kits, against a 90m target. Enrolments stood at 49.1m on 24 August 2026, from about 46.5m in July and 16.4m in June 2025, on 12,000 biometric registration kits deployed nationally (enrolment count). The second operator took two lots of the registration project in July 2026, covering Afar, Amhara, Tigray, Sidama and three southern regions (registration lots), and a four-lot procurement of about US$54m for registration super agents awaits the lender's clearance (aide-memoire). 2026-09-07 - the enrolment rules reached the repository for the first time: the programme's own list of 33 accepted proof-of-identity documents, from the local administration card and passport to birth, education, marriage and business records, and the documents foreign nationals must present - an origin card and passport for those of Ethiopian origin, a residence or work permit plus passport for other foreign residents, and a valid refugee card for recognised refugees. Neither carries its own issue date. 2026-10-09 - a trade publication reported a public developer sandbox opened for the digital identity, which counted more than 52 million registrations and 208 million electronic verifications at 9 October 2026.	MOVEMENT
Gabon	335,384 people have enrolled for the electronic identity card since June 2024, with 147,224 cards collected and 78,500 files disputed. The first public coverage figures were given to the National Assembly on 2 June 2026: 335,384 enrolled, 164,944 cards produced, 147,224 collected, 92,614 files in processing and 78,500 disputed (enrolment figures). Issuance launched on 24 June 2024 (launch) with no enrolment figure on the record and the project indicator still at a zero baseline (project indicator). The disputed files are about 23 per cent of all enrolments (disputed files), and the count rests on press accounts of a spoken answer; no registry or ministry publication exists. The step before the card is the number. The interior ministry opened enrolment for a personal identification number on 3 April 2024 - fourteen alphanumeric characters issued to a citizen after their biometric data is recorded, for Gabonese aged 16 and over, in Greater Libreville first and the rest of the territory in a second phase, stating that the card cannot be established without it. Enrolment for the number is therefore the ceiling on card issuance, and no count of numbers attributed has been published at all.	MOVEMENT
Gambia	A national identity system went live in June 2026 and nationwide rollout of ten-year biometric cards began in August at six centres. Field reporting from biometric identity enrolment centres in the Greater Banjul Area found high demand meeting daily processing caps (reporting). The repository holds no enrolment total. The system issues instant cards from the national data centre, and the cards are produced with a Ghana-based supplier; no enrolment or issuance figure has been published since launch (rollout, launch). It runs under an eight-year build-co-operate-transfer contract signed in January 2026, with a 70/30 revenue share, ten-year card validity, free replacement of valid cards and a new data centre; no contract value is published in anything held (contract, terms). The arrangement it replaced was a foreign concession the government had resolved to end, so the country moved from a concession to a build-operate-transfer contract rather than to direct state issuance. 2026-06-29 - the identity system went live with the President as its first enrollee, under a public-private partnership between the interior ministry and the card supplier. What it replaced is documented from two sides: a lender diagnostic finding fragmented mandates, no universal coverage and weak interoperability across the identity estate, and a Kanifing processing centre shut when its electricity bill went unpaid, on a foreign-run biometric system in place since 2018.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	19.2m people aged 15 and over are registered with 262 institutions integrated, and enrolment of 3.1m children aged 6 to 14 resumed in May 2026. The identification authority's deputy executive secretary said, reported 9 October 2026, that registration of children aged 0 to 5 would begin the following week, alongside the continuing registration of those aged 6 to 14. A backlog of 640,000 cards was cleared and distributed by September 2025, with instant issuance nationwide and eleven overseas missions (registration); the institutions-integrated count moved from 95 in September 2025 to 262 in early 2026 (registration, backlog cleared). Child enrolment resumed on 5 May 2026 against a target of 3.1m, phased at 21 days per region and run jointly with the health insurance authority (child enrolment, biometric verification). A paid tier has operated around the clock on three shifts at an Accra centre since 1 August 2026, which the agency states is optional and does not replace its 276 district offices; no throughput, staffing or fee schedule is published, and there is no equivalent extension of the free daytime service (paid centre, 24-hour centre). 2026-10-05 - the identification authority began school-based registration of children aged 6 to 14 in the North East and Upper East Regions.	MOVEMENT
Guinea	Biometric enrolment opened in one commune in March 2026 on a first phase of 2,000 certificates, after the predecessor project closed with about 8,000 identities. The earlier foundational project closed on 28 June 2024, two years early, having issued about 8,000 unique identities (closure). Enrolment for biometric birth certificates and national identity opened in Sanoyah commune as phase one (enrolment). The biometric national identity card was decreed free for first applications in February 2025 (free card), and the state contractor alleged in July 2026 that unprovided-for fees and pay-for-priority were being taken at enrolment centres, with no ministerial response on file (fees alleged).	MOVEMENT
Guinea-Bissau	The eighteenth identity card production centre opened in June 2026, and a third enrolment centre in February. Coverage is being built through physical estate rather than through a national campaign: a third regional enrolment centre opened in February 2026 and the eighteenth production centre nationwide in June. No enrolment total is published against those centres. The nearest population figure the repository holds for an identity-adjacent register is the electoral roll of 966,152.	MOVEMENT
Kenya	More than 42m identity records were digitised in FY2025/26, with enrolment extended to dependants aged 7 to 17. The population management vote holds near its supplementary peak at KSh 10,993.0m for FY2026/27, against KSh 8,085.6m in the prior year's original estimates (vote, prior year). Government is procuring a system to cut card issuance to ten days and passports to a week, on a headline-only source with no contract, vendor or value held (procurement). Application charges for the identity card were scrapped and the KSh1,000 replacement fee waived for six months by gazette under the Registration of Persons (Amendment) Rules 2025, and the interior cabinet secretary said in June 2026 that a digital Maisha Card carried on a phone would follow. Against that, an analyst compilation puts 2.3 million adults without a card, 80.5 per cent of them aged 18 to 25 - the exclusion concentrating on the adults most often asked to prove identity to enter formal work or finance. No official count of the unregistered is published. 2026-09-17 — the registration bureau said more than 600,000 people have been registered since extra vetting in border counties was scrapped; rights groups want it ended for good.	MOVEMENT
Lesotho	The identity register covered roughly 85% of the eligible population in 2022, and perceived ease of obtaining an identity document rose 42.5 points to 58.9 over 2014-2023. 2022-05 — an assessment put coverage at an estimated 85 per cent of the eligible population, a little over a million people of a total 1.2 million. 2026-02-26 — a 2026 commitment was made to an integrated digital identity system. 2026-06-29 — a modernisation framework consultation opened at the home affairs ministry. The coverage figure is four years old and both movements since are about the platform rather than enrolment. No later count is published. 2024 — public perception of how easy it is to obtain an identity document rose 42.5 points over 2014-2023 to 58.9 of 100, 15th of 54 African states and the country's most improved governance indicator. It measures perceived access, not enrolment.	MOVEMENT on perceived access rather than coverage

COUNTRY	DEVELOPMENTS	PROGRESS
Liberia	Mass enrolment has been suspended since June 2025 on coverage below 15 per cent, with a concession to enrol all 5.3m people now before Parliament. The concession is with an Austrian firm to finance enrolment in 18 months, operate and transfer; consultations have concluded and the draft agreement has gone to Parliament, with selection and terms unpublished until legislative approval completes and the registry stating it will disclose the agreement only after ratification (concession, firm, restart). About 740,000 had enrolled by the end of 2024 at a US$5 card fee, and about 640,000 prior registrants were locked out with issuance halted (lockout, funding gap). Enrolment has been mandatory for citizens and 90-day residents since April 2025 under an executive order making the identification number the primary credential for banking, health, education and telecoms (order, no identity, no transaction). So a mandatory credential has been unobtainable for more than a year, on a register the state cannot afford to run and is now handing to a concessionaire. 2026-09-16 — a presidential proclamation declaring National Identification Day put enrolment at about 720,000, with issuance still suspended; the registry says free cards under the pending US$54.7m agreement will go only to disadvantaged and unemployed citizens, others paying a fee.	MOVEMENT
Libya	Holders of administrative rather than national numbers remain outside services gated on the national number, with no published resolution. Protests were reported in June 2025 by holders of administrative numbers excluded from services that require a national identification number (protests). No resolution has been published since, and the repository holds no count of the population holding a national number and none of those in the administrative category. Vital events are close to fully recorded on the state's own figures: the health ministry's vital statistics report put birth registration at 100 per cent and death registration above 90 per cent for 2020, measured against estimated births and deaths. No independent check of either figure is held.	NO CHANGE
Madagascar	The first adult enrolment phase registered more than six million people against a two-million target, and a second phase opened in September 2026 aiming at more than 10 million. A steering committee validated the proof of concept and released 2,500 kits across 1,729 centres operating six days a week (kits); the January pilot had enrolled about 130,000 people across 116 centres in 26 communes (kits, pilot, enrolment). More than six million adults were enrolled in the April to June 2026 phase, against a two-million target, with a second phase in preparation (phase, identity). The counts are reported on different scopes and dates, from 2.6m in two months to over 5.6m in total (counts, review), and no cost figure for either phase is reported. The pilot ran through regime change, civil unrest and a cyclone. 2026-09-16 — the second phase of mass biometric registration, assigning each person a unique number, was launched at Anosy with World Bank financing through the connectivity project, targeting more than 10 million citizens over 18 by July 2027 with 1,000 kits added; the same account puts the first phase at nearly 5 million enrolled. No enrolment count for the second phase is yet published.	MOVEMENT
Malawi	Over 13.5m adults hold a national digital identity, about 99 per cent of those aged 16 and over, up from 12.5m a year earlier. The registration system has been in operation since the National Registration Act came into force in 2015, with 12.5m enrolled and links to over 33 public and private institutions recorded in May 2025 (system). The count reached over 12.8m adult identities in January 2026 (intermediate) and over 13.5m by July, about 99 per cent of the eligible population, with over 150,000 enrolled between April and June 2026 of whom 53 per cent were women (coverage, baseline). It is the highest identity coverage in this pass, and the registry's own figure is preferred over external accounts describing coverage as already complete. 2026-09-08 — a digital identity wallet was announced for launch on 16 September. It launched on 16 September, and more than 22,000 people had obtained it by the next day, a small fraction of the registered population.	MOVEMENT
Mali	The confederation biometric identity card was piloted on Malian soil in June 2026 for another member state's residents, with no Malian enrolment figure published. The cross-border diaspora enrolment pilot ran in Bamako in June 2026, enrolling Burkinabe residents rather than Malian citizens (pilot). No Malian enrolment figure, coverage share or rollout date is published, so the country's first biometric identity card operation on record served somebody else's population.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritania	The population register reached 5.1m entries against 3.4m in 2019, with enrolment now a permanent public service, and a contested residual without papers. Figures given to deputies in June 2026 put 5.1m on the register against 3.4m in 2019, with more than 1.7m new enrolments, over 613,000 people captured by a difficulties survey and 238 local commissions installed (register); enrolment is now a permanent public service under the 2025 reform (register). More than 94 per cent of the population had been reported enrolled since 2020 (coverage). A contested residual of citizens without papers falls disproportionately on two population groups and sits in tension with the aggregate coverage claim, which is why the difficulties survey exists.	MOVEMENT
Mauritius	Registration runs under the 1981 Civil Status Act, with a further issuing centre tendered in December 2025. The Act has been in force since January 1982 and is held in its consolidated form (Act). Office space was put out to open national bidding in December 2025 for a further registration and issuance centre of the identity card unit (tender). The Finance Act 2026 amends the statute book around the registers (Act). No coverage rate, enrolment count or backlog figure for the population register is published in the sources held.	MOVEMENT
Morocco	4.6m electronic identity cards were issued in 2024, including 219,408 for citizens abroad through seventy-one centres at diplomatic missions. The police directorate's annual report gives 4.6m cards issued during 2024, with 219,408 issued to citizens abroad through 71 centres at diplomatic missions (annual report). No 2025 or 2026 issuance count is held (institutional account), and no coverage share of the adult population is published, so the repository holds a flow figure and not a stock one.	NO CHANGE the newest issuance figure is for calendar 2024
Mozambique	856,101 identity cards were produced in the first half of 2026, up from 730,527, of which 297,470 were issued free. Production ran at 856,101 cards on 813,307 applications in the first half of 2026, against 730,527 on 677,305 applications a year earlier (production); the figures are the directorate spokesperson's with no published series behind them (production). Free first issuance of the identity card, birth certificate and personal certificate was extended to 2027 and widened to children and adults alike, with 297,470 free cards issued in the first half of 2026 (extension, cards); neither the 2027 end month nor the deadline replaced is stated (extension).	MOVEMENT
Namibia	117,175 identity documents were issued in 2025, and 40,238 of 166,237 printed were left uncollected over fifteen months. The minister gave 117,175 national identity documents, 126,737 birth certificates and 682 refugee cards issued in 2025 (issuance); the 2024 comparator held in the repository is a campaign count rather than an annual series (issuance, budget). Between April 2025 and June 2026, 166,237 documents were printed, 125,999 collected and 40,238 left uncollected, about a quarter of the print run (uncollected). A school-based drive reached 24 of 55 target schools by July 2026, with officials returning to each school to hand printed documents to learners rather than requiring a ministry visit; documentary requirements are unchanged, which the source names as the residual barrier for learners with incomplete birth registration (drive).	MIXED a school-based registration drive running while about a quarter of printed documents go uncollected
Niger	The universal identification programme was restructured onto the statutory register stack, against a goal of 22m enrolled by 2026 and a pilot of more than 3,000 in four communes. The programme launched in 2022 with a goal of 22m enrolled by 2026 and has been restructured to carry the statutory register stack, with enrolment starting in the capital; a birth-certificate pilot targets 21,202 under-fives at Filingué. An open-source identity pilot enrolled more than 3,000 people across four communes, with no later enrolment figure published (open source). The gap between the 22m target and the pilot is the whole of the country's enrolment evidence: no national enrolment count under the restructured programme is published. 2026-09-15 — biometric card enrolment opened in Agadez, collected locally and processed centrally. No count of cards enrolled or issued is published. The identification programme is a USD 81m agreement in three components targeting 8 million people (presentation, coordinator). Its open-source test laboratory ran a pilot at Tanout enrolling 500 people (laboratory).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	A ward-level drive opened free enrolment across all 8,809 wards, against a 22.3-point gender gap in who holds an identity number. Free enrolment runs in every ward across the 774 local government areas, targeting women, children, elderly people, persons with disabilities and refugees (drive, progress). Women are 38.8 per cent of enrolled holders against 61.1 per cent men, a 22.3-point gap (gap); in one state twenty-one centres serve about 7.5m people, a ₦3,000 round trip is prohibitive, no number means no access to the maternal-care fund, and rural women's phone ownership is 42 per cent against 78 urban (gap). The drive is aimed squarely at that gap and no post-drive gender figure is published. 2026-09-05 - a second use for election hardware was floated rather than agreed: the admissions board asked the electoral commission for biometric verification machines idle between elections, and the commission ordered a proof of concept to establish whether the devices are fit for that use. No device count, transfer basis, data-protection assessment or timetable is published, and the two registers rest on separate legal bases.	MOVEMENT
Rwanda	More than 10m people had been photographed and biometrically captured in 27 of 30 districts by September 2026, against about 14m and a June 2027 hard deadline. More than 8m registrations were reported in August 2026, with biometric enrolment accelerating through the year (enrolment, acceleration, progress). Registration and photographing are separate counts and the gap between them is not explained, which matters because the June 2027 deadline is statutory rather than administrative: on that date legacy documents cease to be valid whether or not the gap has closed. The national identification appropriation outturned at 140.7 per cent of its allocation in 2024/25 and was appropriated again for 2026/27 (appropriation); it is the digital line the fisc actually funds, against the flat data-protection line and the 11.5 per cent cyber-skills execution (appropriation, prior). 2026-09-16 — the agency put biometric capture past 10 million across 27 of 30 districts as enrolment opened in Rusizi, with three more districts next, and described the credential as a card, a QR code on a phone and a separate access token. The count is the agency's own and no district-level figure is published. 2026-10-08 - the identification agency suspended the photography exercise for the digital identity card, naming no resumption date, while pre-enrolment continues online.	MOVEMENT
Sao Tome and Principe	A free national identity card campaign ran in phases including an islet and a diaspora arm, with cards collectable at the embassy in Portugal. The campaign ran to an outlying islet in January 2026 and extended to the diaspora, with cards collectable at the embassy in Portugal by June (campaign, diaspora, embassy). Free issuance and physical collection at an embassy are the two access designs that matter most in a small island state with a large diaspora, and both are recorded here. No issuance count, coverage figure or campaign end date is published.	MOVEMENT
Senegal	Only 58.98% of children in early-childhood structures held a civil-status document in 2025, against 81.4% of under-fives registered in 2023. The early-childhood agency's director-general states that of 186,744 children received in its structures in 2025 only 110,148 held a civil-status document — 58.98% — and that the gap bars children from national examinations and competitions, reported at the signature of a partnership convention committing the two agencies to joint registration campaigns. The household-survey series reads higher on a different population: 81.4% of children under five registered with the civil registry, 81.0% urban and 81.9% rural. The two figures are not reconciled. On the registry side the agency reports 20 million acts digitised, indexed and loaded into the national register, reachable from the application deployed in 400 centres, and ruled that mayors running unauthorised civil-status software must stop. 2025-12-01 - the adult credential reads higher than the child record: about 10 million citizens held the biometric card in 2025, 90.63% of those aged 15 and over, estimated from 7 million voters on the November 2024 register and 2.9 million holders without electoral data. It is a derivation, not an issuance count.	REGRESSED

COUNTRY	DEVELOPMENTS	PROGRESS
Seychelles	The Civil Status Division holds the National Population Database and issues identity cards to all residents under statute. The Division's own description confirms custody of the National Population Database and the preparation and issue of identity cards to all residents under the Civil Status Act and the Identity Card Act (division). The statistics bureau draws its population releases from those civil-status and immigration administrative records: an all-resident population of 122,730 at 30 June 2025 (mid-year) and 123,097 at 31 December 2025 (year-end). That the register sustains national statistics is evidence it is maintained; no coverage or completeness estimate for it is published.	NO CHANGE
Sierra Leone	The identity agency reported about 93 per cent population coverage, and registration, card issuance and coverage are three different metrics kept apart in the record. Coverage was reported to a digital public infrastructure consultation in August 2026 and has not moved in the repository since a 2025 statement of the same figure (coverage, services, opportunity). Card issuance is tracked separately because registration, issuance and coverage measure different things and conflating them would overstate what a person actually holds (issuance). An ethnographic study documents human intermediation in enrolment — brokers standing between the citizen and the register — reported as analysis rather than as a state position (brokers). The authority puts coverage near 90 per cent across 2022-2024, against under 7 per cent before 2016 (presentation). The card costs NLe140 for a national and NLe2,000 for a non-national, collectable after 72 hours (fees). 2026-09-17 - the registration authority enrolled 100 inmates from three Freetown correctional centres for identification numbers, their cards issued free at government cost, aligning inmate records with the national identity system after biometric pilots in 2018 and 2020.	NO CHANGE
Somalia	About 2m people were registered for the national identity credential by April 2026, against an estimated 19.7m population of whom about 85 per cent held no legal identity in June 2025. Registration passed one million in November 2025 and reached about 2m by April 2026, under a mass registration drive launched in September 2025 (registration, million, drive). NIRA's director general put about 85 per cent of an estimated 19.7m population as holding no legal identity in June 2025, and fewer than 16 per cent held a government-issued document at the 2022 household survey (interview, survey), so the starting point is very low. Two member states have not adopted the national system, one operating its own identification authority, so the register is federal in name and partial in territory (member states, centre). 2026-09-20 - the registration authority has registered more than 1.5 million citizens since 2023 against a target of 15 million by 2029 - about a tenth of the way with three years to run. Issuance is to extend to embassies abroad, with priority stated for persons with disabilities and displaced communities; no breakdown by region, sex or age and no issuance rate is published.	MOVEMENT
South Africa	Smart identity services ran at more than 500 bank branches by 27 September 2026, against 410 in August and 30 branches a year earlier. 2026-01-28 — issuance itself set a record: 4,002,964 smart identity documents in 2025, up 17%. The branch counts do not form a series — 372 and 408 appear a week apart in August before the 410 in the reply. This is the largest measurable delivery in the twelve months, and it is a channel expansion rather than a new system. 2026-09-27 - the bank channel reached more than 500 branches across four banks, at least one in every province, against a stated target of 750 by the end of 2026 with first-time smart ID and passport applications and home delivery; a deputy director-general said the green ID book would be phased out within two years, with no date set. 2026-10-01 - the home affairs minister set 31 March 2027 as the end of green ID book production and put smart ID replacements at more than 515 bank branches.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
South Sudan	About 90 per cent of the population holds no form of identity, against school-based registration launched for examination candidates. The World Bank's 2026 country diagnostic puts about 90 per cent of South Sudanese as holding no form of identity, an estimated 10 per cent a nationality certificate and under 1 per cent a national identity card, with women 37 per cent of nationality-certificate holders (diagnostic). Registration was launched at a secondary school in August 2026 with expansion to more schools planned, following card collections in one region (school, collection, issuance). The stated fee is over 50,000 South Sudanese pounds (school). Stock held and cards issued are still reported on different bases across sources, so the coverage figure and the issuance figures cannot be reconciled to each other.	MOVEMENT
Sudan	Coverage was 88.8 per cent in 2021; the war closed Darfur's offices and thousands of children have no national number. Sudanese authorities reported 35.5 million of 40 million inhabitants registered by 2021, up from an official 82 per cent in 2016, with coverage materially lower in peripheral, conflict-affected and displaced populations (report). No national figure has been published since the war began. A lawyer states that Darfur's civil registry offices shut down amid the conflict, leaving thousands of children without birth certificates or a national number (account). Issuance has resumed in two states: Port Sudan in December 2025 (resumption) and Kassala in February 2026 (resumption).	REGRESSED
Tanzania	Digital acquisition of identification numbers and cards is under development, aimed at rural access (report). Measures are under development to let citizens obtain identification numbers and cards digitally, aimed at rural access (report). The repository holds no enrolment figure against it. The coverage figures run to December 2025 in an annual financial-inclusion report (coverage, usage). Issuance and distribution are stated separately in the same report; the bases differ between personalised, issued and distributed, both counts rose and the gap did not close (issuance). At the window's start the repository held only a deadline to deactivate the numbers of people who never collected cards, with no count (uncollected). A one-year window opened for more than 14,000 dismissed public servants to correct records and obtain cards, closing inside the next reporting year (window). 2026-09-17 — the backlog is now the finding: 2,027,103 processed identity cards stand uncollected, against more than 300,000 at the start of the year. The Prime Minister told the registration authority to put a legally backed reminder-and-penalty mechanism into law, to remind every registered person once a card is ready, and to integrate more deeply with employment and social-service institutions so identity data can be cross-checked, putting more than 132bn/- to its development projects for 2026/27 including 31 registration offices.	MOVEMENT
Togo	More than six million unique identification numbers and biometric cards were reported at end-December 2025, a rounded floor rather than a precise count. Enrolment campaigns ran region by region through 2025 and 2026, and enrolled, number issued and card delivered are one counter because the card is handed over at the campaign (numbers, platform, campaign, phase). The figure comes from the government's own second-half 2025 reform-implementation report, which is not held (count). That the three stages collapse into one counter is unusually clean for this frame — most units in it report enrolment and issuance separately and cannot reconcile them. 2026-09-14 — identity documents were issued free to a fixed cohort: 4,200 schoolgirls are to receive nationality certificates, 300 issued in the first week. Enrolment is free and voluntary in four steps, with a receipt carrying a code in 24 to 48 hours and the card in 72, open to foreign residents and erasable on request (steps, questions). The programme is USD 72m of a USD 395.1m regional operation, targeting 8 million credentials by 2026 (financing). 2026-09-26 - with the Centrale region closed, more than six million people are registered and about 5.9 million cards produced, nearly 80 per cent reportedly distributed, and Kara, the last region, is scheduled for October to December 2026.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tunisia	72 municipalities were trained on civil-registration harmonisation in late 2025, while the unified population registry remains unbuilt. A July 2025 national workshop run by the statistics institute with the interior ministry mapped the legal and regulatory revision a unified national population registry would need, which places the registry as an objective rather than an institution. Three training workshops in November and December 2025, run by the interior ministry, the statistics institute and the national computing centre, covered 72 municipalities and harmonised civil-registration and vital-statistics practice, including the Medania digital system. Birth certificates can now be issued remotely through the national services platform, with a remote translation service alongside. No registration-coverage rate, unregistered-population estimate or registry timetable is held.	MOVEMENT
Uganda	Over 60 per cent of printed cards are uncollected, and the auditor general recorded a backlog whose figures were ten months old at publication with no current series published. The identification authority holds 36.15 million people on the national register, close to 77% of the population (figure). The mass exercise closed in February 2026 with over 60 per cent of printed cards uncollected (printed, renewals). The auditor's figures are as at late October 2025 and are reported alongside cross-district queue chaos over new-card collection; the authority publishes no current backlog series (backlog). First-time enrolment against target and renewal ran at two different rates, and the two rates are the finding: efficient for people already on the register (enrolment). In September 2026 about 5.4 million printed cards were still uncollected; a further mass drive was stated to Parliament with no start date or budget on record (drive). 2026-09-29 - figures at the registration authority's first identity expo put about 36.2 million people identified, roughly 78.8 per cent of the population, on the authority's own count. 2026-10-01 - the registration authority announced a December 2026 exercise to register learners without identification numbers and correct record errors.	MOVEMENT
Zambia	Biometric enrolment runs against a funded baseline of 1,500,000 people with digitally verifiable identity at December 2022 and a 4,000,000 target at October 2030, and card issuance was deferred until after the August 2026 election. The enrolment figure was given by the ministry to the state broadcaster (enrolment, safeguards, switch). Biometric card issuance was deferred to after the general election (deferral). A nationwide mobile campaign for 3.5m identity documents launched for a three-month run in April 2025, and its result is the largest single unreported outcome in the pre-window base (campaign). The paper card has been in issue since before independence, on the appraisal document's own wording rather than a published commencement date (paper card).	MIXED biometric enrolment progressing against a 2030 target while card issuance was deferred past the election
Zimbabwe	A 2022 mobile civil registration exercise issued 3,203,389 documents, and the home affairs minister said he was not aware of any identity-document backlog and was hearing of it for the first time. The 2022 exercise ran February to September and was reported to Parliament by the home affairs minister (exercise). The backlog measure is set against that minister's denial in the Senate; he said he was not aware of any backlog and was hearing of it for the first time (backlog). A donor-funded mobile registration drive ran for five days in a remote district in July 2025 with no count of documents issued held (drive), and birth registration coverage is dated to the 2023-24 demographic and health survey rather than to the articles reporting it (coverage).	MIXED three million documents issued in a 2022 mobile exercise while the responsible minister says he is unaware of any backlog

National maintenance of id and credentials systems

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The police signed a biometrics and digital-forensics memorandum with a foreign interior ministry in November 2025. Nothing of the kind was on record at the window's opening. 2025-11-21 - a memorandum was signed covering fingerprint-analysis training and biometric identity-verification exchange. No value, duration, workplan or data-handling arrangement is stated for it. Biometric identity-verification exchange between two states' police forces, in a country whose data-protection authority has issued no enforcement decision and whose deliberations take effect on its own website, has no published safeguard attached. 2026-10-01 - applicants reported waits of three months or more for biometric driving licences and six to eight weeks for passports, with no official explanation.	MOVEMENT
Angola	Card printing moved from a single national centre to all 21 provinces from 1 July 2026, on a platform built abroad since 2017. 2026-07-01 — all 21 provinces began printing the identity card locally, with two to three printers per province planned and a 24-to-48-hour issuance target; one province reports issuance under 24 hours against one to two weeks before, and the same decentralisation reached the exclave province in July. This is printing only: enrolment and biometric capture are untouched. Underneath it, the card has been issued on a foreign-built platform since 2017, and the digital identity platform now out to tender is also to be procured rather than built. No source states who maintains either system, what the support arrangements are, or whether source code or operational control sits with the State — which is the question this indicator asks and the record does not answer. 2026-03-13 - the biometric electronic passport was issued across all 21 provinces by the end of March 2026, and to the diaspora from May.	MOVEMENT on printing capacity, with the platform itself foreign-built
Benin	One agency holds identity, population, civil and electoral registers under the 2018 decree setting its attributions; a durable funding model is still being defined. The arrangement was founded by the 2018 decree setting the identification agency's attributions and places identity, population, civil and electoral registers under that one agency. 2026-09-02 — what is not settled is how it pays for itself: an international expert was sought to define a durable model for the identity system as digital public infrastructure. Maintenance is nationally held and not yet nationally funded. 2026-09-16 — the identification agency opened renewal of the biometric identity card online to all, through its e-services platform. No uptake figure is stated.	MOVEMENT
Botswana	P108,505,050 was sought in 2026/27 for Omang card production and the registration systems' maintenance. 2026-02-24 — the ministry requested P108,505,050 to cover, among other things, the production of national identity cards and the maintenance of the birth and death registration and identification systems. No supplier, contract value or maintenance arrangement is separately published, and the repository holds no statement of where the systems are maintained or who holds the source code.	NO CHANGE funded annually and unchanged in form

COUNTRY	DEVELOPMENTS	PROGRESS
Burkina Faso	The identification office created by decree of 15 December 2004 manages, updates and secures the centralised national identity database; the credential it issues is being replaced by a confederation card adopted on 6 November 2025. The institution is an administrative public establishment responsible for national identification, issuance of the national identity card, and the management, updating and securing of the centralised national identity database. That is the maintenance function, and no staffing, budget or system-refresh statement for it is held. 2025-11-06 - the council of ministers adopted the decree instituting the confederation's biometric identity card, available from age five and valid ten years, with a five-year transition period for withdrawing existing national cards across the member states. Enrolment opened at Arbinda in August 2026. Alongside it a second credential programme runs: a vendor was recruited for the unique electronic identifier and mass registration organised through committees run entirely by public structures so that fingerprint and iris data stay sovereign. Nothing states how the two enrolments relate. 2026-09-16 — the identification office ran special enrolment operations across every region alongside the Identity Day ceremony; no count of enrolments taken is published. 2026-10-09 - the digital-transition minister said enrolment for the digital identity, budgeted at over FCFA 40bn, was due to start in October 2026.	MOVEMENT
Burundi	Travel-document production is stated to be assured entirely by ministry staff since a foreign supplier's contract expired. The interior ministry records that travel-document production is assured one hundred per cent by the migration directorate's own staff since the expiry of the contract with a foreign supplier, a new supplier providing consumables only. It is the clearest official statement on this ledger that a credential system is nationally operated rather than vendor-run, and it is the ministry's own. What it does not carry is a volume, a backlog figure or any statement about the identity card as distinct from the passport — so the claim covers travel documents and cannot be extended to the credential estate as a whole. 2026-08-25 — the identity system itself is headed the other way: the finance ministry's procurement plan puts BIF 8.90bn on recruiting a contractor to set up a national digital identity system, by open international tender. No award is held.	NO CHANGE
Cameroon	The card is produced under a fifteen-year build-operate-transfer contract signed in May 2024, with a FCFA 10,000 pre-enrolment fee. The credential is produced under a fifteen-year build-operate-transfer contract signed in May 2024, with a pre-enrolment fee of FCFA 10,000, and nothing in the window changed that arrangement. The same pattern runs through the consular credential, issued under a ten-year build-operate-transfer contract signed in April 2022. No transfer milestone, revenue share, performance standard or exit arrangement is published for either, so what the state will own at the end of fifteen years is not stated anywhere on file.	NO CHANGE
Cape Verde	The state printer began domestic production of identity documents on 11 June 2026. The Imprensa Nacional de Cabo Verde announced on 11 June 2026 that its personalisation centre, inaugurated in December 2024, is fully operational and authorised to issue the Cartao Nacional de Identificacao, the Titulo de Residencia para Estrangeiros and the electronic passport, at a stated daily capacity of 1,200 identity cards and residence titles and 2,400 passports, and an estimated 79,600 cards, 5,000 residence titles and 60,000 passports a year. The credential issued off the national civil identification base is now produced in country. No issued-volume figure against that capacity is held, and nothing states what the external supplier arrangement cost before it.	MOVEMENT
Central African Republic	The identity card is issued and its issue is reported as a site of extortion and discrimination. Passport issuance resumed in 2025. Maintenance here means whether a person can obtain and renew a credential, and the answer is uneven. The national identity card's legal basis is held, with extortion and discrimination reported around its issue at Ndélé. Biometric passport issuance resumed in January 2025 after interruption. The diagnostic the repository rests on is old — a 2017 identification system assessment — and the successor is not built: the national digital identity system is planned. No renewal cycle, revocation route or correction procedure is published for any credential.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Chad	Enrolment continues through the identity agency's own portal and management system, with operator partnerships securing subscriber data. The register is operated and its maintenance is being extended outward rather than deepened. The identity agency runs the national identification number and its management system through its own portal, on a national biometric register whose enrolment total is not published nationally. Two partnerships in the window extend it: mass enrolment with an operator, tied to securing subscriber data, and a memorandum on secure identity with the migration organisation. What is not held is any statement of how the register is kept current — no renewal cycle, revocation route or correction procedure — and the data-protection authority that would oversee it does not exist.	MOVEMENT
Comoros	The card is instituted by loi n 14-023/AU and produced under a concession whose supplier changed in 2026. The justice ministry's index carries the promulgating decree for the law instituting the digital, biometric identity card, which is the first record of a statutory basis in the repository. The system is maintained by a supplier, not by the state. Production runs under a build-operate-transfer concession, whose new holder is to domicile the data in the Comoros and decentralise production to the other islands, and the new passport carries a polycarbonate laser-engraved data page with a chip meeting civil-aviation standards; production was suspended for most of March 2026 during the handover. No contract length, value, renewal cycle, issuance figure or service-level obligation is stated anywhere on file, so what happens at the end of the concession is not knowable from the repository.	NO CHANGE a statute now on file and still no maintenance regime, renewal cycle or issuance figure
Congo	100,000 blank passports and 330,000 identity cards were reported in August 2026, on a civil identification directorate established by order in 2022. 2022-06-02 — orders established the civil identification directorate. 2026-08-09 — 100,000 blank passports and 330,000 identity cards were reported. Stock is held nationally; nothing on this ledger establishes who maintains the systems that produce it, or under what contract.	MOVEMENT
Cote d'Ivoire	The population identification line was voted identically for FY2026 at FCFA 8,791,576,615, the largest single named digital line in the budget. The FY2026 finance law voted FCFA 8,791,576,615 for population identification, the same figure as FY2025 and up from FCFA 5,000,000,000 in FY2024. It is the largest single named digital line in the Ivorian state budget, and it is domestically financed. No outturn is published for either year, and nothing states what the line buys - enrolment, card production, register operation or system maintenance are not separated. A flat vote across two years is consistent with a system in steady operation and equally with one not being invested in. 2021 - the identification office runs the card as a public-private partnership with the Belgian firm Semlex, which built the database, takes no state payment and charges FCFA 5,000 a card, on a project a 2019 estimate put at FCFA 460bn over ten years; its data-sharing and transfer agreements are unpublished.	NO CHANGE
Djibouti	The mobile identity service is run by the Interior Ministry with four domestic bodies, on a register the state maintains by law. The founding law assigns administrative management of the register to the population directorate and technical and security management to the state information-systems agency - the credential system is maintained in-country by statute, not by contract. 2026-02-10 - the mobile identity system was launched by the Interior Ministry with the digital economy ministry, the network operator, the cybersecurity authority and the state information-systems agency, the biometric data held only by the Interior Ministry. No maintenance contract, vendor arrangement or key-management rule is published, so what the state runs itself and what it buys is not established from the record.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
DR Congo	Identification is run under a twenty-year exclusive partnership while the state appropriated FC 20,654,178 for it. The identity platform operates under a twenty-year exclusive partnership signed in June 2025, and the state's own appropriation for national identification acquisition in the enacted 2026 finance law is FC 20,654,178 - a figure that cross-foots exactly against its group total and is not a transcription error. It corroborates the identification office's own account that the allocation obliged recourse to a partnership. No transfer milestone, revenue share, performance standard, exit arrangement or data-custody rule is published for the twenty-year concession, and no state body is named as holding the register at its end. 2026-08-31 — a Brussels court referred fourteen defendants to trial over the contract under which a Belgian firm produced the country's biometric passports from 2015 to 2025, on charges of bribery of foreign public officials, money laundering and tax fraud; the civil parties, 51 citizens who filed in 2020 with a coalition of anti-corruption organisations, put the diversion at close to US$60 million (referral, report). The ministry picked 50 pilot registration agents from more than 9,000 candidates, training from 15 September 2026; no citizen has been enrolled on the record. 2026-09-15 — the first 50 enrolment agents began training.	NO CHANGE the identity layer runs on a twenty-year exclusive concession while the domestic appropriation for identification is negligible
Egypt	The interior ministry created a unified national biometric verification platform, it states for the first time. 2026-02-14 - the interior ministry states it has created, for the first time in the country, a unified national platform for biometric verification and instant authentication using face-recognition algorithms. No lawful basis, retention rule, accuracy figure or oversight arrangement is stated with it. 2026-08-23 - the central bank board approved regulations governing the digital financial identity platform for identifying bank customers and verifying identities electronically. 2025-09-10 - a citizens' data update form was launched in one governorate as the initial phase of a nationwide expansion - the maintenance side of the register. The machinery underneath is described once, undated beyond its year: state budget funding established the Civil Status Information Center and the birth, death, marriage, divorce and family registration databases, and a state technology company maintains the national number databases including photographs and fingerprints, and operates the integration of the national identity database with the recruitment, public security, labour permits, supply, traffic, social insurance, justice, social solidarity and central bank systems. It carries no enrolment or card figure. 2021 - a presidential decision created a Defence ministry complex to preserve civil records and biometric data, setting no retention period.	MOVEMENT
Equatorial Guinea	Document issuance runs through a state agency, extended to two further towns in June 2026, on a regional credential specification. The credential is not the country's own: it is the regional biometric passport, whose chip and issuance-control rules are set by CEMAC regulation, with a national agency as document custodian under ministerial procedures for missions abroad. The agency's own reach is growing — identity and passport services extended to two further mainland towns in June 2026 — while the underlying registry law dates from 1957 and reform is only under review.	NO CHANGE
Eritrea	The card is issued and maintained on paper. Most holders still carry the old handwritten card, with a long application backlog. The standing position is set out in the external civil-documents reference: the identity card is issued by the immigration and nationality department at a fee of 100 nakfa, a plastic card with hologram and fingerprint was introduced late in 2015 for those aged 18 and over, and very few new cards are in circulation, most people still holding the old handwritten cards, with a long backlog of applications. A credential most of whose holders carry a handwritten version is not maintained in the sense this indicator asks about. The electronic card was being introduced to replace the handwritten one in 2018, and that replacement is still incomplete.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eswatini	Identity card production resumed in February 2026 after a suspension for technical upgrades, and in August the ministry asked citizens to verify the chief code on their documents. Production resumed at ten service centres in February 2026 after a pause for technical upgrades, with a plan to clear the resulting backlog (resumption). In August 2026 the ministry asked citizens to check that the chief code on their identity documents matches their actual chiefdom, warning that an incorrect code creates difficulty in reaching government services, and describing how corrections are made in the civil registration system (campaign). The statutory basis is the Identification Order of 1998, which establishes the population register and the personal identity number (Order). The card does not meet the criteria for digital identification. No issuance figure, backlog size or correction count is published at any date.	MIXED production restored after a suspension while a campaign asks citizens to correct the records themselves
Ethiopia	The identity programme was incorporated as a state-owned enterprise in August 2026 under the sovereign wealth fund, and plans to widen its wallet. The programme was commercialised into the sovereign wealth fund with a 10bn birr cap in March 2026 (wealth fund), then incorporated as a state-owned enterprise on 4 August 2026 with the programme's executive director appointed chief executive (enterprise). The holding company states the purpose as attracting partnerships and creating long-term value, and positions the enterprise for export (the same account). The wallet is planned to carry academic transcripts, professional licences, healthcare records, property titles and compliance data beyond the government credentials it holds today, with no timetable, consent model, controller arrangement or regulatory approval stated (wallet expansion). 2026-10-03 - the state enterprise running the digital ID began charging banks for record retrievals and biometric authentications, and the bankers' association asked for a consultation with the central bank.	MOVEMENT
Gabon	The national directorate enrols, personalises and issues in-house at its own facility, with a foreign supplier providing the card and the software. The supplier's own annual review lists the card and passport among its delivered solutions, and it is the only primary on the question (supplier review). The directorate personalises in-house alongside the passport and the residence permit, which is what reporting means when it describes the card as produced domestically; the two layers are compatible and were once read as three competing suppliers. No procurement notice, award publication or gazette entry is held, so the supply arrangement is established by the supplier's own publication and by no Gabonese public record. A fare is about to become a biometric credential. The national transport company is preparing a biometric transport card for Libreville buses, securing the collection of personal data before digitising access. No issuance date, data controller, retention rule or fare structure is stated.	MOVEMENT
Gambia	The system was procured design-build-transfer from a foreign supplier, and now runs from a data centre in-country. The invitation to bid put the identity documents and digital identity systems out on a design-build-transfer basis, which places operation with the supplier until transfer. The data centre inaugurated at Abuko in June 2026 puts the hosting inside the country, which is the part of the arrangement the state now controls. The older credential chain it sits on is statutory: a birth certificate supports an identity card, which supports a passport carrying a D5,100 biometric fee. 2026-10-06 - an immigration officer testified that the department no longer has access to data generated under the former biometric identity system.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	The authority is mandated to maintain the card and register and secure its data, while US$457m is owed to it for verification services. The mandate is statutory: to create, maintain, provide and promote the card and the national identity register, including the accuracy, integrity, confidentiality and security of the personal data it holds. The financing model is a partnership, not an appropriation. The authority states a 15-year public-private partnership under which its own component is US$124m and the private partner's US$169m, against a life cost of US$1.2bn with US$176m of tax exemption laid before Parliament in 2018, with no government money paid to the partner and costs recovered from project proceeds at US$5.40 a chip card and US$1.50 a barcode card - its own figures, published against a parliamentary demand for a forensic audit. Cost recovery predates the 2026 regulations: registration inside the country was free while diaspora registration was charged at US$55 in the sub-region, US$75 in the rest of Africa and US$115 beyond it, and the card expires ten years from issue. 2025-09-21 - against that, US$457m is owed by the revenue authority, the health insurance scheme and the passport office for biometric verification services, with disconnection threatened from 1 October 2025. Nothing records whether it happened.	MIXED the mandate and a cost-recovery schedule are in place while US$457m of arrears stand against the service
Guinea	Two credential chains run separately: passports by the police directorate, with mobile enrolment teams from 2026, and cards and civil status by the identity office. 2026-01-09 - the security minister set out the passport arrangement on national television: issuance is a mission of his ministry carried out by the national police directorate, and from 2026 applicants in the interior no longer travel to the capital, mobile enrolment teams being deployed where roughly 500 applicants are gathered, doing both enrolment and on-site delivery, starting with the pilgrimage cohort, with an appointment-booking system announced as the next step. No figures, contract or supplier are given. 2026-03-23 - the elections directorate and the identity office handed residence certificates and habitation attestations to commune secretaries-general and delegated civil-status officers; the residence certificate is henceforth issued free and exclusively by commune secretaries-general, ending the involvement of neighbourhood chiefs, who retain the habitation attestation. A commune secretary-general notes no residence certificate can issue without a prior habitation attestation from the neighbourhood chief. The identity office's own card line is at pilot stage, with biometric birth certificates and national-identity enrolment running in one commune.	MOVEMENT
Guinea-Bissau	Production runs on a contractor's network; no statute or state operator is on the record. The identity card production and enrolment network is a contractor's, and the repository holds no Guinean statute governing it and no state body named as its operator. What the state does is open centres: eighteen production centres nationwide by June 2026. The regional card scheme is likewise external, with a roadmap consultation opened in February 2026.	NO CHANGE
Kenya	600 live capture devices were procured and issuance reported at ten days, on a statute dating from 1947. The Registration of Persons Act, assented in December 1947 and commenced in 1949, remains the statute providing for registration and the issue of identity cards (act). 600 digital live capture devices were procured, with new identity cards reported issued in ten days (procurement), and administration officers trained on the revised registration system (training). An anti-corruption commission opened talks in August 2025 on integrating its systems with the population register (integration). The ten-day issuance figure is the ministry's own. 2026-10-03 - a National Assembly committee found identity registration in Bungoma held back by shortages of staff, vehicles, equipment and connectivity, with more live-capture kits awaited.	MOVEMENT
Lesotho	A 2026 work plan with UNICEF commits to a MOSIP-based national identity platform covering passport and identity renewal and proof-of-life verification. The work plan was signed by the ministry and UNICEF on 3 March 2026, covering passport and identity renewal, biometric registration and proof-of-life verification on a MOSIP base (work plan). Digital identity pilots had begun under the memorandum with India, with no platform then named (memorandum), and the systems under development were reviewed with the national university in February 2026 (review). No procurement, vendor or go-live date is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Liberia	The driver licence and vehicle registry moved onto a state-run platform rather than out to a concessionaire. The transport ministry's launch of January 2026 covers licence management, card printing, dispatch, audit trails and compliance monitoring on a state-run platform, with an online renewal application and billing integration to the revenue authority. The identity register runs the other way. The 2011 Act vests the biometric system in an autonomous state agency, but the registry's arrears to its systems vendor were reported at US$1.7m in June 2025, and the identity-document contract named in the Senate's July 2026 debate is a foreign supplier's. Some enrolment capacity came from inside government rather than a vendor: the elections commission transferred more than 500 biometric kits to the registry in July 2025 to spare a new purchase, subject to licensing and technical modification. No record shows them in service.	MOVEMENT
Libya	The civil registry match completed across 257 offices covering 97 per cent of households; the project is still unfinished. The registry authority created by decree in 1998 is the source layer for every Libyan credential, and the electronic-to-paper match completed across 257 offices covering 97 per cent of households. The government reviewed the unfinished project and its links to other agencies in July 2026 without giving a completion date. The passport authority separately set out an electronic passport project and printer renewal to a prime-ministerial committee in September 2025.	MOVEMENT
Madagascar	The institution responsible has existed since 2020; an audit firm for the identity system was sought in March 2026. A decree of December 2020 created the national civil status and identity centre, responsible for maintaining, securing and operating the national registers and the unique identifier under the interior ministry (decree). An expression-of-interest notice of March 2026 recruited a firm for the identity system's performance audit, evidence the system remained under active project-led review (notice). Infrastructure equipment for the data centres that host it was tendered in three lots in February 2026 (tender). Maintenance to date has run through a donor project that closed in June 2026; no successor operating budget is held.	MOVEMENT
Malawi	National ID cards stopped carrying expiry dates on 16 September 2026, ending the renewal regime that had left about two million cards expired. Maintenance is a statutory duty: the National Registration Act 2010 assigns upkeep of the register to the Director and district registrars and prescribes the renewal, replacement and correction of credentials. No service standard or performance figure is published against it. 2025-12 - the bureau extended the validity of roughly two million expired national identity cards to 1 January 2027 while it renews, prints and distributes replacements. No renewal throughput or completion forecast accompanies it. 2026-01 - the servers were relocated to the national data centre, pausing issuance and verification for four days. The infrastructure was maintained; the credentials on the ground were deferred. 2026-09-16 — the homeland security minister directed that national ID cards be issued without expiry dates, superseding the extension. 2026-09-26 — an investigation reported a US$5.09m World Bank-financed contract for 2,400 registration kits with remote software support, awarded to a Hong Kong-registered supplier in March 2026; the bureau and the regulator did not say who can reach the system remotely.	MIXED a two-million-card renewal backlog ended by removing expiry dates while the register itself moved house
Mali	A national agency for civil status document security was created in 2025, and passport supply moved from a French to a Chinese vendor in October 2025. The agency's board was named on 21 July 2026, including the digital-economy ministry and the civil-status director. The agency was created in 2025 with no output figure published (agency). The passport supplier changed from Idemia of France to Emptech of China in October 2025, a change officials cast as regained sovereignty and local data management (supplier). Neither move puts the credential's production in national hands: what the repository records is a domestic body responsible for security and a foreign body responsible for supply. 2024-02-13 — the civil-status census database came back under national control: after Idemia shut the service over unpaid invoices, the government launched Mali Kura biometrie and said the data had been recovered with no foreign maintainer. No independent account of the recovery is held.	MIXED a national agency created for document security while passport supply moved from one foreign vendor to another

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritania	The transport minister stated in August 2026 that driving licences and registration plates would be issued in biometric form before the end of 2026. The statement came alongside continued reform of the land transport directorate (statement). It is a stated target with no procurement, supplier or system specification published, and it is the only credential besides the national identity card and the passport that the country has committed to issuing biometrically.	MOVEMENT
Mauritius	The omnibus bill would make permits issuable in digital, card or paper form and impose a digital travel authorisation on visa-exempt arrivals. The authorisation would be applied for electronically and paid before travel; the bill was introduced and not enacted (provision). It is the first credential in the repository whose form is set by statute rather than by the issuing agency, which is what makes the digital form enforceable rather than optional.	MOVEMENT
Morocco	A biometric passport decree approved in July 2026 abolishes temporary passports and removes the address, and identity-card renewal moved online. The decree specifies four languages including Amazigh, an encrypted chip, the address removed from the biodata page and temporary passports abolished, with the current format continuing during a transitional period; the joint body that sets issuance procedures is not yet in place (decree, account). Identity-card renewal moved online in mid-2026 with pre-fill, document upload, residency-certificate tracking and stamp-fee payment, biometric capture remaining in person; no take-up figure is held (renewal, announcement).	MOVEMENT
Mozambique	8,790,034 identity cards had been issued, about 31.4 per cent of the population, from 208 service posts, and a national mobile digital identity and electronic signature layer went out to expressions of interest. 2026-05-29 — the digital transformation agency issued a request for expressions of interest to design and implement a national mobile digital identity and electronic signature layer, integrated with the interoperability platform, the national population registry and the national public-key infrastructure. It is the clearest step in the window toward a maintained identity and credentials layer, and it is at procurement, not deployment. The system it would sit on is thin. The civil identification directorate's own account puts issuance at 8,790,034 identity cards to date, about 31.4 per cent of the population, across 208 service posts and 14 diplomatic missions, with a production centre rated at 15,000 cards a day, and names operationalising the link between the identification and civil-registration systems among its own outstanding challenges. A press rated at 15,000 cards a day against coverage of 31.4 per cent is not a capacity problem, which points the question at demand, distribution and cost rather than at production.	MOVEMENT a mobile identity layer entered procurement over a card system covering under a third of the population
Namibia	The electronic identity is free at the point of issue for first-time applicants, renewals, amendments and error replacements, with a first duplicate at N$150. A first duplicate costs N$150 and a second N$300 (fees); the schedule was stated by ministry officials at Gobabis and on a regional awareness tour (fees, expiry). Free issue with a charge only for duplicates is the arrangement most likely to move the uncollected-document figure, and no fee for the card's digital component is separately stated. 2025-12-01 - a second biometric credential is maintained outside the population register: the Roads Authority issues driving licences only after capturing a digital image and fingerprints, with a barcode linked to a biometric check at collection. No link between the licence system and the population register is stated.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Niger	An identification agency was created by decree in April 2026, while the card and passport are produced by a Libyan supplier with a local partner. The agency was created and chartered under the interior ministry with its statutes approved by a companion decree; no budget, staffing or enrolment target is stated and no gazetted text of either instrument is held (agency, restructuring). Two memoranda were signed with the supplier in June 2025 and it now produces both the card and the passport with a local partner, a change officials cast as technological independence and local data control (memoranda, modernisation). Independence from one foreign supplier achieved by contracting another is the tension the cell records rather than resolves. 2026-09-15 — public enrolment for the confederation's biometric passport opened in Niamey at FCFA 45,000 for an ordinary passport, with regional and diaspora centres and online pre-enrolment through mobile money to follow. Niger is the last of the three states to issue it, and no enrolment count is published.	MIXED a national registration agency created by decree while the card and the passport are produced by a foreign supplier
Nigeria	A multipurpose biometric card is in development with the payments switch, a cooperative identity credential is in revalidation, and border management is being biometrically strengthened. The three-in-one biometric card with multiple wallets is in development with the payments switch and the domestic card scheme, for agency services, student loans and farmer inputs (card, memorandum). A six-month revalidation exercise is under way to issue cooperatives a verification number and their members an identity credential under a memorandum with a private identity supplier; no cooperative or member count, cost, or link to the foundational register is stated (cooperatives). Border management is being strengthened through digital technology, biometric identity systems and intelligence sharing, on a statement at a forum rather than a procurement, with no system, vendor, cost or data-protection arrangement for the biometric collection stated (borders). 2026-10-07 - the supervising minister said implementation of the national cooperative identity reform had commenced at no cost to government, and tasked the states to support it.	MOVEMENT
Rwanda	The digital identity was launched nationally in August 2025, enrolment opened in the Southern Province in October, and 1.8 million had submitted by February 2026. The founding instrument is the 2023 law governing population registration in the single digital identity system (law). The new credential was launched nationally at a Kigali exposition in August 2025 (launch), with regional biometric enrolment beginning in the Southern Province on 28 October (rollout). By 22 February 2026 over 1.8 million submissions had been made against a 15 million target (report) — twelve per cent of the target after four months. 2026-10-08 - the identification agency suspended the photography exercise for the digital identity card, naming no resumption date, while pre-enrolment continues online.	MOVEMENT
Sao Tome and Principe	A passport issuance system was launched in April 2026 under a four-year contract with a foreign state mint. The system launched under a four-year contract with another country's national printing and minting house (system). The predecessor system's status is not established in anything held, so what changed is unstated. Passport personalisation held under contract with a foreign state institution is a sovereignty arrangement the record states and does not examine.	MOVEMENT
Senegal	The modernisation programme closed after 42 months stating it met its objective, its director naming enormous connectivity problems across the country in the same statement. At a capitalisation workshop on 27 April 2026 the agency's director-general stated the programme met its objective of strengthening the civil-status information system and consolidating a national biometric identity file, and named the failings directly: connectivity causing enormous problems across the country, centres where internet was installed but the circuit was not exhaustive, very low bit rates, and much work still to do on training registry officers. The institution that holds the files is long-standing: the interior ministry directorate manages non-police population files at a single processing centre, conducts the studies and development of every ministry application and produces the foreigner and refugee cards, firearm permits and telephone-subscriber identification alongside the biometric national card. No maintenance budget, staffing figure or system-availability measure is published for either. 2026-09-29 - the interior minister said production of identity cards would move progressively to Senegalese firms as the Malaysian contractor's contract runs out, with passports also to be made in the country; no end date, firm or tender is named.	MIXED the modernisation programme closed having met its objective while its own agency named connectivity and training as unresolved

COUNTRY	DEVELOPMENTS	PROGRESS
Seychelles	Immigration and Civil Status issues the identity number and card; a November 2025 reorganisation put digital transformation under the Vice-President. The department remains the issuer of the National Identity Number with the digital credential as a layer above it, and from 17 September 2024 permit holders moved from physical cards to virtual IDs (notice). The post-election portfolio assignment of November 2025 placed immigration under a Ministry of Homeland Security and Civil Affairs and gave the Vice-President a modernisation portfolio spanning the ICT department and a new Department of Digital Transformation (portfolios). The wallet has since added a parent-activated Minor ID against a child's existing identity number (Minor ID). Two departments now hold parts of one credential chain, and nothing states how they divide it.	MOVEMENT
Sierra Leone	The identity system runs on the authority's own Tier III data centre, with a migration to an open-source platform piloted but unfunded. The authority reports the centre as Tier III-compliant and carrying the national biometric register, though no certification document is held (centre). The migration to MOSIP has completed its pilot and full implementation is unfunded, as the authority itself states (migration). The authority's own institutional description sets out its ICT infrastructure (authority). An unfunded migration is the sharpest fact here: the maintenance position rests on a platform the owner intends to leave.	MOVEMENT
Somalia	Cabinet approved a third-generation electronic passport plan on 6 August 2026, having been cleared to adopt a regional passport standard in February. The cabinet approval came in August 2026 (plan), after clearance in February to adopt and print the regional bloc's electronic passport (clearance) and a stated overhaul target the previous September (overhaul). No cost, supplier, issuance target or personalisation site is published, and nothing states whether the passport draws on the national identity register.	MOVEMENT
South Africa	Third-party use of the population register was priced from July 2025 at R10 a verification, with the revenue earmarked for the system's maintenance. 2025-06-23 — a price was gazetted for third-party use of the population register: R10 per real-time verification and R1 per batch field, free to state departments, municipalities and statutory bodies, in force 1 July 2025, the department describing it as correcting unsustainable under-pricing of a service it has run since 2013 and earmarking the revenue for the system's maintenance. That is the only funded maintenance arrangement for an identity system on this ledger, and it is unusual in kind: the system is maintained out of what banks and other private verifiers pay to query it. No maintenance spend, uptime figure or upgrade programme is published against that revenue.	MOVEMENT
South Sudan	Passport stock and clearance figures were given at a directorate handover, and a new-generation passport is announced for August 2027 on a validity change with no amending instrument on file. The stock and clearance claims are the outgoing officeholder's own, made at his own handover; the annual applicant figure and a month-long delay are the incoming officeholder's (handover, testimony, booklets, resumption). The new-generation and regional passport is announced for August 2027; ten-year validity would require amending the passport act, the handover was reported as having extended adult validity already, and no amending instrument is on file while the directorate's own account puts the change before the Assembly (passport, roadmap). A validity change reported as done and simultaneously as pending is the same unreadable-instrument problem the gazette entry describes.	MOVEMENT
Sudan	Card issuance resumed in Port Sudan in December 2025 with data recovered to April 2023, and a ministerial relaunch followed. The civil registry resumed national identity card issuance in Port Sudan on 27 December 2025 after a suspension of more than two years, with registry data reported fully recovered to 13 April 2023 and a new security-enhanced card in production (resumption). The interior minister relaunched personal and foreign-origin identity card issuance at the registry headquarters, with Khartoum and the remaining states to follow within about a month (relaunch). Kassala resumed in February after restoring vital records and fingerprint data (resumption). Darfur has not.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tanzania	27.2 million registered and 22.7 million numbers issued at April 2026, with a Child Registration Act still undrafted into law. The home affairs budget speech reports 27.2 million people registered, 22.7 million identification numbers issued and 147 institutions linked as at April 2026, with 2026/27 commitments to registration infrastructure upgrades. The identity authority's director general announced a forthcoming draft Child Registration Act to extend the maintained credentials system to registration from birth. A separate financial-inclusion report puts 22.3 million numbers issued and 20.6 million cards physically distributed for December 2025, a gap of 1.7 million between a number and a card in a hand. That gap, not the registration total, is what the maintenance question turns on, and no explanation of it is published.	MOVEMENT
Togo	External funding of the register was extended in July 2026 past the closing date the agency's own material states. The agency is a public legal person under the Presidency with technical oversight shared by the digital economy and security ministries, created at article 19 of the 2020 statute and given a board, a director-general and financial autonomy by decret n 2020-093/PR. On 16 July 2026 the government signed five financing agreements including additional financing of US$20 million for the unique identification project, to continue the initial phase's activities — a completed signature, extending funding beyond the 30 July 2026 closing date the agency's own material states. It records no change of ownership, operator or maintenance arrangement. Enrolment continues territorially: the Centrale region closed on 26 September 2026 and Kara, the last region, follows from October to December 2026.	MOVEMENT
Tunisia	The identity card law adds a chip and an authentication certificate, and a tax identity card is now sealed by the certification agency. Organic law 2024-22 of 11 March 2024 sets the current framework for the national identity card — issued by the interior ministry's specialised services, carrying a secure electronic chip and an electronic authentication certificate, and mandatory from age 15. Nothing held confirms that issuance of the biometric card has begun. A ministerial order of February 2026 tasks the business register with hosting the remote company-declaration platform, requires digital-identity or electronic-signature authentication, and mandates an electronic tax identity card sealed by the national certification agency and issued within one working day. No credential-lifecycle statement is held: nothing on renewal, revocation, key management or who maintains the chip's certificate estate.	MIXED the credential law is in force while issuance is unconfirmed and a second credential rail advanced
Uganda	Iris hardware was deployed on more than 5,665 registration kits, the authority establishment was expanded, and the system contract is single-sourced with no value, award date or term held. The iris deployment covers the 2024 to 2026 campaign; the registry figures are vendor-sourced and two roughly one-million populations are distinct and must not be summed (iris, unmatched). The establishment expansion was stated in plenary in August 2026; in September the authority put filled posts at 418 of 571, 201 client-facing, and asked for 998 (establishment, support). The contract behind the migration is single-sourced with no contract value, award date or term held, and it is the whole of that relationship in this repository (contract). 2026-09-29 - the company that prints the national identity card said it will print the country's secure documents locally at a new factory; no start date is published.	MOVEMENT
Zambia	The registration department began computerising card, passport and citizenship-document issuance, financed through a US$100 million programme. 2025-08 — the home affairs permanent secretary announced that the registration department has begun computerising national registration card, passport and citizenship-document issuance in collaboration with the state technology institute, targeting online applications including from the diaspora. 2025-09 — a US$100 million digital acceleration programme was approved, the financing vehicle for the new identity and civil registration system. What the repository cannot yet say is who will run it. Both accounts describe a build financed externally and integrated by a vendor to be selected; no statement of in-house operating capacity, staffing or vendor exit arrangement is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zimbabwe	Electronic passport enrolment runs in ten districts, eight provincial centres and one abroad, and civil registration office computerisation bounds a decentralisation model three other states said they would copy. The passport figures were stated by a deputy registrar general at a registrars' meeting (passport). The sub-office computerisation ratio bounds the decentralisation model three other states said they would copy, which is what makes the ratio worth stating (computerisation). A donor-funded programme to digitise and solarise civil registry sub-offices launched in August 2026 with no value, timetable, district list or birth-registration baseline against which to measure its effect (sub-offices, digitisation).	MOVEMENT

Authentication

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The certification and governmental signature authorities were designated by February 2025, modernising the 2015 framework. Both authorities were designated by February 2025 and the regulator's authentication and electronic-signature service was launched in 2025, modernising the 2015 electronic-signature framework. No certificate count, relying-party list or usage figure is published.	NO CHANGE
Angola	Parliament granted legislative authorisation for an electronic signature and certification regime, and a public key infrastructure was contracted ahead of it. Tech By Tech released its AngolaID wallet in test mode, reported 9 October 2026: a credential created by video liveness check and facial recognition, verifiable by QR code, with an API and SDK for banks, schools and clinics; the company says it neither issues nor replaces the state identity card. The repository holds no institution that has integrated it. 2026-07-30 — parliament unanimously approved legislative authorisation to the President, valid 90 days after publication of the enabling law, for a regime defining an accrediting authority, a root certification entity and the evidential weight of an electronic signature, grounded on the insufficiency of two 2011 instruments. The substantive text will be an executive instrument and is not yet made. The technology is ahead of the law. A public key and time-stamp infrastructure was announced as a ministerial intention in June 2025 with nothing contracted and no legal basis; it is now contracted as a component of the US$150m public digital infrastructure project, and the tax authority is already running mandatory electronic invoicing on it in practice. The trust layer is being built ahead of the law that would govern it.	MOVEMENT
Benin	The national root certification authority and trust services entered operation on 1 July 2026, having been established a year earlier without operating. The national root certification authority and its trust services were established in July 2025 and not yet operating; 2026-07-01 — they are recorded as operating. That closes a twelve-month gap between an instrument and a service, and it is the trust layer under the exchange, the diaspora passport platform and the certificate issuance reported elsewhere in this report. No certificate volume, accredited provider list or evidential rule is published, so what a signature issued under it is worth in a Beninese court is not established on this record.	MOVEMENT
Botswana	The public key infrastructure is funded, begun, incomplete and non-operational, with P423m secured and control transferred to the intelligence directorate. 2026-07-30 — the public accounts committee was told the project is funded, begun, incomplete and non-operational: P423m secured, control transferred to the intelligence directorate, no working system, no timeline and no accountable owner. The ministry's own headline figure appears as both P420m and P423m in the single account. The consequence is stated plainly in the same source: the country has no certificate-backed identity verification and no recognised electronic-signature layer. That is the missing floor under everything else in this report. The services portal, the payslip portal, the rescoped digital identity and the regional know-your-customer framework all assume a trust layer that P423m has not produced.	STALLED

COUNTRY	DEVELOPMENTS	PROGRESS
Burkina Faso	The identification office holds and secures the centralised national identity database. No authentication or verification service against it is on the record. What the repository holds is the register and the credential: an administrative public establishment responsible for national identification, issuance of the national identity card, and the management, updating and securing of the centralised national identity database. Verification against it happens in at least one sector — identification of the subscriber is a mandatory precondition for activating a subscriber card — but nothing describes the mechanism: no authentication service, no application interface, no verification volume and no assurance level is published. The card is meanwhile a requirement for most aspects of economic life, so the checking is being done and the repository cannot see how.	NO CHANGE a standing position the repository holds for the first time
Burundi	A border system reads and verifies passports at the international airport against international police databases, the first authentication on the ledger. 2025-08 — a border management system was launched at the international airport, automating reading and verification of passports with a direct interconnection to international police databases, announced for progressive extension to other border posts. It is the first instance on this ledger of a credential being checked against anything rather than simply read. What it authenticates against is a foreign database, not a Burundian one. The domestic position is that national identity is presented as documentary evidence rather than authenticated against a register, and no extension of the border system beyond the airport is recorded.	MOVEMENT one border post
Cape Verde	SNIAC released card middleware at version 1.9.9, letting holders use the card's digital functions with institutions. The civil identification and authentication system publishes middleware, at version 1.9.9, that lets a citizen use the digital functions of the identity card in dealings with public and private institutions. The residence title for foreign nationals, created by Decreto-Lei 20/2014, was launched under the same system on 29 July 2021. SNIAC is the umbrella system, run from the justice ministry's portal. No activation count for the digital credential is held, which the ledger carries as an open row.	MOVEMENT
Central African Republic	The foundational diagnostic records no functioning national digital identity authentication service; nothing since replaces it. The foundational identification diagnostic records that no functioning national digital identity authentication service existed, and names the country's largest digital database at the time. It remains the repository's only systematic account of the identification estate, and it is nine years old. Since then the only related fact held is that the unique identification number is recorded as mandatory - an obligation without an authentication service behind it on the record. No verification transaction, service level or consuming system is published.	NO CHANGE a first stated position with no earlier account behind it
Chad	The certification agency was reformed by ordinance in January 2026 because the 2015 frame had become preventively and operationally insufficient. The council of ministers of 15 January 2026 adopted a draft ordinance reforming the national agency for computer security and electronic certification, the body created by Loi n. 006/PR/2015 of 10 February 2015 that holds the electronic certification mandate, recording that the 2015 legal frame had become insufficient (council). The reform was promulgated on 23 March 2026, widening the agency's remit to cybersecurity, personal data, electronic transactions, cybercrime, video surveillance, drones, social platforms and artificial-intelligence systems (promulgation). On the identity side, the appraisal records the system issuing the identification number, the national identity card and the passport, with three per cent of Chadians holding a card (appraisal).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	No authentication service is on file; the new passport's data page carries a chip meeting civil-aviation standards and nothing reads it. The one comparative study in the repository is the World Bank's 2017 identification systems report, which lists a Comoros brief; the capture holds the front matter and table of contents and not that brief, so what the brief says cannot be read from the repository. What is held is the credential. The new passport's data page is polycarbonate and laser-engraved, with a chip meeting civil-aviation standards. No verification service, application interface, relying party or transaction count appears anywhere on file. A chip nothing queries is a security feature, not an authentication system. Carrying the card became compulsory before the card became digital. From 12 August 2025 every Comorian must carry the national identity card and produce it on demand, the interior minister giving three purposes and pairing the measure with a regularise-or-be-expelled instruction to foreign nationals. No statutory instrument, penalty or enforcement record is on file, and no source states what share of the population holds a card.	NO CHANGE the identification report the repository holds does not carry its Comoros brief
Congo	The security agency joined the African network of agencies in June 2026, and the cross-border single window was restated by decree. The standing instrument is the 2014 decree regulating the electronic signature, which the ledger carries. 2026-01-01 — revised statutes were issued for the cross-border single window. 2026-06-26 — the national information systems security agency joined the African network of cybersecurity agencies. No national authentication service, and no count of authentications, is recorded.	MOVEMENT
Cote d'Ivoire	One bank was integrated for real-time identity checks against the national register under a convention signed in November 2025. At the window's opening no commercial institution was integrated with the register. 2025-11-11 - a convention was signed integrating one bank for real-time identity checks against the national register. No second bank appears on file, no pricing is stated, and no volume of checks has been published. Nothing states the legal basis on which a commercial party queries the register, what a customer may refuse, or how a failed match is handled - which matters more here than the count, because the same route is being extended to lenders and social-protection targeting elsewhere in this report. 2026-10-05 - the government launched a feasibility study for a national authentication platform and identity wallet, due by January 2027.	MOVEMENT
Djibouti	A mobile digital identity platform was launched on 9 February 2026, with authentication and electronic signature among its priority uses. The platform did not exist at the window's opening. 2026-02-09 - it was launched at a national digital identity forum, with authentication and electronic signature among its priority uses and biometric data to be stored exclusively by the Interior Ministry, and reported in the biometrics press. Interoperability with driving-licence and health records is stated as planned rather than delivered. No activation count, service count or transaction figure has been published since launch, so what the credential is used for is unknown.	MOVEMENT
DR Congo	RDC-PASS launched on 13 June 2026 as the national digital identity and authentication platform. RDC-PASS is online following its presidential launch on 13 June 2026, on a phased rollout that trains agents before registering citizens, and lists authentication, electronic signature, document verification and bank and mobile-money identity as its operative service set. Agent training was under way at launch. No registration count, relying-party count or uptake figure is held, and nothing states how it keys to the general population register.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Egypt	A remote biometric verification and e-signature platform was opened to licensed mobile operators on 18 September 2026, after an August pilot. A digital identity card enabling remote verification was under development. The app is now released and in its second version, integrated with electronic signature and seal services, with civil-registry-linked verification stated as approaching. No registration count, first-release date or governing decree is held. Signature and seal services are live using the security token and integrated with digital identity, with remote signature stated as expanding across government services and the digital post box being finalised. 2026-02 - an interior ministry Android pilot has users scan the identity card and complete facial recognition to authenticate for selected government services; it was described at launch as the country's first unified biometric authentication platform. 2026-08-26 - the telecoms regulator piloted a remote biometric verification system for telecom services, linked to the civil registry. 2026-09-18 — the communications and interior ministries launched a platform for remote biometric identity verification and electronic signature, first through licensed operators' own phone applications, built with the telecom regulator, the IT industry agency and a local developer. No user count is stated.	MOVEMENT
Equatorial Guinea	No verification service exists; identity is presented as a document copy, as in the wallet onboarding flow. Nothing in the repository records a query service against the civil register or the identity document. The one documented downstream use is manual: a wallet onboarding customers on a SIM and a copy of the national identity document. Biometric verification is being built inside a single operator rather than as a shared service: the state telecom's approved modernisation programme carries biometric know-your-customer checks.	NO CHANGE
Eritrea	Authentication is a card shown at a counter. The anti-money-laundering proclamation requires financial institutions to identify customers; no electronic verification is recorded. The only authentication duty on the repository is the anti-money-laundering proclamation's: financial institutions must set customer identification and acceptance policies for business relationships and for cash transactions above US$10,000, with the central bank supervising. That is authentication done by eye. There is no verification service, no electronic signature framework and no credential that could be checked against a register, and the financial system it serves has no automatic teller machines, cards or internet banking to check one at. Most cardholders carry a handwritten card.	NO CHANGE
Eswatini	The central bank is standing up a national electronic know-your-customer registry to digitise identity verification. The registry was reported in September 2025 (registry). No go-live, participant count or governing instrument is published. It would be the country's first authentication layer, and it is being built by the central bank rather than by the identity or ICT authorities — so the first working identity verification in the state may sit inside the financial regulator.	MOVEMENT
Ethiopia	194m identity verifications have been performed across 150 integrated agencies, and biometric kits have gone to banks. The programme reports 194m electronic know-your-customer verifications to date across 150 integrated agencies, on its own unaudited figures (verification count). Two thousand portable face, fingerprint and iris kits were distributed to 31 banks in November 2025 of 6,000 planned, at about US$17m, with the remaining 4,000 under a re-issued tender (biometric kits). No authentication failure rate, exception-handling procedure or availability figure is published. 2026-10-09 - a trade publication reported a public developer sandbox opened for the digital identity, which counted more than 52 million registrations and 208 million electronic verifications at 9 October 2026.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Gabon	No authentication service against the national register exists. The one credential with a published verification design is the digitalised driving licence launched on 24 March 2026, whose enrolment was suspended on 21 September. The licence's security design is an authentication code readable by scanner and contactless communication, in a document carried by the transport ministry and built by a domestic small enterprise. It is a sectoral transport document with an authentication mechanism of its own, not a general identity-verification service. Nothing verifies against the identity register itself: no authentication service, application interface, assurance level or verification volume is published. The national digital identity system is one of four public-administration projects set out at the sixth steering committee and nothing is operating on the record. Where verification does happen it is a lookup rather than an assertion: the interior ministry's online service checks a citizen's entry on the electoral roll from the personal identification number and their name. 2026-09-21 — the transport ministry suspended enrolment for the digitalised licence six months after launch, with 6,993 printed licences awaiting collection and no resumption date; unnamed sources link the pause to production-system faults under heavy demand and to power cuts. 2026-10-02 - the licence's operator moved the system onto the postal operator's infrastructure under a convention; no date for resuming enrolment is given.	NO CHANGE a standing position the repository holds for the first time
Gambia	A fingerprint identification system launched in April 2026 for criminal investigations; no civil authentication service is on the record. The system launched in April 2026 with European Union and international police support is for criminal investigation, not service access. No cost figure is published and the statement of its legal basis is uncited. Nothing in the repository records a verification service against the national identity register for banks, telecommunications operators or government services. The credential chain still runs on document presentation rather than query.	MOVEMENT
Ghana	Biometric-only verification is law from June 2026, and Parliament has now passed the instrument for biometric SIM registration. The amendment regulations bar visual inspection and photocopying and make biometric verification the only lawful check (regulations). The SIM drive was announced for the first quarter of 2026 with liveness detection and 80 per cent self-service specified, and no start date is on file (re-registration); the 2021 to 2023 registration has been declared invalid and the 2022 biometrics confirmed never authenticated against the identity database (re-registration, never authenticated). 2026-09-07 - Parliament has passed the legislative instrument governing SIM registration, and the minister states the biometric verification phase will be introduced before the end of 2026. The same account puts completion of the 2021-2023 exercise it replaces at 44.28 per cent of subscribers. No start date, enrolment route or subscriber deadline is published and the instrument itself is not held, so what has moved is the authority to act rather than the exercise. 2026-09-23 - the licensing authority put its biometric identity-verification app on Apple's App Store and opened a web verification platform, so vehicle-registration applicants can verify their identity remotely; no user count is published.	MOVEMENT the instrument passed but the drive it authorises has not begun
Guinea	There is no national authentication service; the standing identity-verification duty is a 2013 central bank instruction requiring credit institutions to identify and verify their customers. The instruction, taken under the banking law, requires regulated credit institutions — banks, financial establishments and specialised financial institutions — to identify and verify their customers, with its anti-money-laundering section carrying customer identification, beneficial-owner verification and record retention. It is sectoral and pre-digital: it governs identity checks inside the financial sector, not authentication against the persons register. No evidenced national electronic identity authentication service exists, no public key infrastructure or trust list is published, and the electronic-transactions statute is published by the regulator only as a title with no text. What is being built is the register rather than the service: the national register of natural persons is the single official source for the biometric electoral file, and public-key infrastructure bidding documents were being prepared under the regional digital programme. 2026-09-18 - work opened on extending the persons register and building a platform to verify and validate identity, the minister asking for its first phase before the end of 2026. It is a target set at a workshop, not a service.	NO CHANGE a standing position the repository holds for the first time

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea-Bissau	No verification service exists; the identity card is presented rather than queried. Nothing in the repository records a service that checks a Guinean identity number against the register. The interoperability rules that would allow one are new — the national interoperability regulation approved by decree in October 2025 and the delivered platform design — and no participant system is named against either.	NO CHANGE
Kenya	Talks opened with a foreign secure-identity provider on a platform letting citizens reach public and private services on one digital identity. Both sides agreed to deepen technical and policy collaboration towards an interoperable identity architecture under ministry-wide governance; no contract, procurement, value or timetable is stated (talks). A verifiable-credential wallet proof of concept was completed for the public service commission after an audit found over 2,000 fake certificates, with no single credential database and no production decision or funding on file (proof of concept).	MOVEMENT
Lesotho	A digital service-ID pilot of about 10,000 participants began in April 2026, requiring a national identity document, a registered SIM and biometric registration. The pilot was announced on 25 March 2026 to begin on 2 April with about 10,000 participants in a testing phase (pilot). Registration requires a valid national identity document, a registered SIM card and biometric registration. No vendor, legal basis or evaluation criteria is stated, and no result from the pilot has been published.	MOVEMENT
Liberia	Executive Order 147 mandates verification through an Identity Query Portal and an e-Verification platform. The order requires all public and private institutions to use the registry database, the Identity Query Portal and the e-Verification platform, with data handling bound to Part IX of the 2011 Act. It is the only general authentication mandate the repository holds. What the repository does not hold is any measure of use: no query volume, no participating-institution count and no availability figure for either service. The suspension of card issuance through the first half of 2026 makes that absence material.	MOVEMENT
Libya	The Level 3 biometric tier of the national digital identity entered technical trials with the central bank and several banks in April 2026. The identity authority and the Central Bank of Libya put the biometric tier into technical trials with several banks in April 2026, ahead of its use in banking know-your-customer checks (trials). The system is named the Digital Identity Management System for Citizens in that release and LY-DNID in the July one, and no enrolment count, authentication volume or assurance standard is published for either name (July release).	MOVEMENT
Madagascar	The biometric card's authentication module was specified in June 2025 and its pilot validated for nationwide deployment in March 2026. A technical webinar of June 2025 described the biometric identity card's architecture, including a QR-encoded verifiable credential and an identity-verification authentication and know-your-customer module (webinar). Ceremonial enrolment for citizens aged 18 and over opened in January 2026 with a district pilot (launch). A steering committee validated the pilot results in March 2026 and authorised nationwide deployment of 2,500 enrolment kits (committee). No relying party, authentication volume or service using the module in production is named.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Malawi	A mobile identity wallet was announced for September 2026 and a separate blockchain identity wallet is in pilot, and the repository cannot establish whether they are the same product. The mobile wallet was named and announced for a September 2026 launch, complementing rather than replacing the plastic card, requiring prior registration and needing no periodic renewal; it was not live in August 2026, and rights advocates have flagged equal-access, rural-exclusion, cybersecurity and literacy caveats (wallet, launch, target). A blockchain-enabled wallet built by a development agency with an international computing centre is in pilot before nationwide rollout, with credentials to extend to birth certificates, driving licences and marriage certificates; no pilot scale, rollout date or cost is stated, and nothing is stated on how the arrangement sits under the data protection statute (blockchain, plan). Neither announcement names the other. 2026-09-11 - the registration bureau set the wallet's national launch for 16 September, the digital card carrying the same validity as the physical one. 2026-09-16 — the Nzika digital ID wallet launched, and national ID cards stopped carrying expiry dates. 2026-09-16 — the registration bureau launched the Nzika wallet to hold national ID, birth, marriage and death credentials on a phone, optional and complementing the physical card, and the minister ended expiry dates on the card with immediate effect. No verification standard or relying-party count is stated.	MOVEMENT
Mali	Authentication is being built into the state's own payroll: biometric control of state agents. The public key infrastructure remains planned. Mali has a credential and not yet a way to verify it electronically. The national identification number dates from 2006 and the regional biometric identity card is at pilot stage with the diaspora. The one working authentication in the window is internal: biometric control of state agents under the integrated human resources system, carried into a Council of Ministers communiqué in July. The general mechanism, a public key infrastructure framed with the telecommunications union, is still planned and was restated among the digital week's recommendations.	MOVEMENT
Mauritania	A national public key infrastructure and certificate management system went to tender in two lots under donor credit and was twice extended, with no award held. A second addendum of 10 June 2026 moved the proposal deadline and the public opening to 21 July 2026 and proposal validity to 22 November 2026, on IDA credit 7445-MR (addendum); the earlier notice had put evaluation at 40 per cent technical and 60 per cent cost (tender). The notice title promises a national digital identity system but the operative text describes only electronic certification integrating with the existing register, so what is being procured is narrower than what it is called. No award is held. 2024-08-15 — a UNDP-funded pilot supplied by TECH5 replaces passwords on the e-government portal with face verification, on the supplier's account.	MOVEMENT
Mauritius	The Mobile ID wallet has been in service since September 2024 and is hosted on the sovereign facility, with no user or issuance figure published. The wallet launched in September 2024 with a foreign vendor under the 2024 national identity card regulations (launch, regulations). It is now hosted on the Rose-Belle facility and still carries no published user or issuance figure. A domestic analysis welcomed its convenience and pressed for privacy and surveillance safeguards around the enabling regulations (analysis). Single sign-on has run since December 2020, its document wallet rising from 2,067 users in January 2022 to 12,172 by that September (account). Three 2024 regulations add a mobile identity, which civil-society analysis argues should be stored on the device alone (brief).	NO CHANGE
Morocco	Facial recognition is permitted case by case for remote bank account opening and benefit proof of life, both on prior authorisation since 2020. Remote account opening was permitted by a deliberation of April 2020, conditional on a prior undertaking to migrate authentication to a future national trusted-third-party system that is not established as built (banking). Proof of life for benefit recipients was permitted by a deliberation of July 2020 on the same migration condition, agreed with the insurance and social-security supervisor (benefits). No authorisation count, revocation record or migration record is held for either.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Mozambique	A national mobile digital identity and electronic signature infrastructure went to tender in May 2026, with partner discussions opened in August. The digital transformation agency floated a tender in May 2026 for a national mobile digital identity and electronic signature infrastructure (tender, partner search). The ICT institute opened discussions with a local partner in August 2026 on a platform extending digital identity, advanced digital signatures and public key infrastructure into a national digital trust layer; it follows a February 2026 memorandum with a foreign institute covering credentialing, auditing, training and technical assistance for operating a root certification authority (discussions). 2026-09-05 - the prime minister directed the state digital certification system extended across all sectors.	MOVEMENT
Namibia	A biometric fingerprint system underpins identity checks, and a chipped electronic identity card with remote authentication missed its September 2026 launch. The home affairs ministry's own annual report describes the operational biometric fingerprint system and the electronic birth management system connectivity that underpin identity verification (report). The minister confirmed in Parliament a September 2026 rollout of electronic identity cards, following delays to finalise legislation on data protection and identity management (confirmation). A pilot ran at Otjimbingwe from September 2025 and a public awareness campaign explaining the consent-based authentication model opened in Omaheke in August 2026 (campaign). The card is free at the point of issue for first-time applicants and carries a digital identity component for remote authentication. The legislation the launch waited on is still not enacted. 2026-10-08 - a trade publication reported the electronic identity card's September rollout delayed because the legal framework had not been finalised, as two ministries briefed Parliament.	MOVEMENT
Niger	A national public key infrastructure was enumerated as planned in July 2025 and nothing on record has been built. It was listed by the critical-infrastructure committee alongside the cybersecurity centre and the forensics laboratory (infrastructure). No trust anchor, certification authority or electronic-signature capability exists for the country on this record, which is the layer the biometric card would need to authenticate against anything other than itself.	NO CHANGE
Nigeria	Consent-based verification went live in May 2025, the identity commission holds the national root certification authority, and airport identity verification runs on number and face. Consent-based verification launched in May 2025 (verification). The root certification authority role was handed over from the technology agency, with the wider partnership formalised in July 2026 covering the key-infrastructure transfer and harmonised digital-trust standards; it creates an overlap with the electronic-signature provisions of the still-pending economy bill, and which instrument governs digital signatures is unresolved (overlap, duties, certification). Travellers enrol identity number and face biometrics for digital security checks and boarding (airport). 2026-09-23 — the identity commission denied that identity data had been breached and offered for sale, and its Director-General ordered an investigation into whether licensed tokenisation verification agents had breached their licences, directly or through sub-licensees. No finding or timetable is published. 2026-10-05 - a technology outlet reported that a presidential directive orders every ministry, department and agency to adopt the authentication service as its default identity check.	MOVEMENT
Rwanda	The 2023 law defines authentication against the single digital identity, and an upgraded public key infrastructure went to tender in January 2026. The statute enacted in June 2023 defines authentication against the single digital identity and obliges relying parties to integrate with it (law). Design, supply and installation of an upgraded national public key infrastructure went to tender in January 2026, as the foundational trust layer for signing, encryption and trusted transactions (tender). A consent and access-log layer sits alongside it on the ledger. No authentication transaction volume is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sao Tome and Principe	Resolucao 35/2020 mandates an authentication platform on single sign-on integrated with digital identity management, and prototypes are live with no production service confirmed. The resolution names a platform based on single sign-on fully integrated with digital identity management and supported by the interoperability platform, alongside a state certification infrastructure providing qualified digital signature (resolution). A lender mission reported credential, portal and electronic-signature prototypes live with a system integrator engaged and a roadmap running January to May 2026 (mission, pilot). No source confirms an authentication service in production, and the citizen portal that would consume it is in beta (portal). Six years on from the mandate, the repository holds prototypes.	MOVEMENT
Senegal	The state operator issues certificates to users of the administration; no citizen-facing sign-on or identity-register verification interface is described. The operator runs a key management infrastructure under the 2008 electronic transactions law and its certification decree, issuing server and personal certificates for authentication, signature and encryption, with registration, renewal, revocation, publication, archiving and key recovery, and centralised server-side signature. Two limits sit in the same account: the certificate service is scoped to administration users rather than citizens, and no citizen-facing single sign-on or national identity-register verification interface is described. What citizens do authenticate with is the identification number itself, used as the login key of the government single-window portal — an identifier presented, not a credential verified against the register.	NO CHANGE
Seychelles	The digital identity authenticates with a password and a second factor through an authenticator app, digital certificate or email, on OpenID Connect. The platform's own security documentation states password plus two-factor authentication through its authenticator app, a digital certificate or email, built on the OpenID Connect protocol and a commercial PKI (security). The wallet extends the same credential to a Digital Driving Licence connected live to the licensing authority's system (wallet) and, for minors, to a QR-presented virtual card (Minor ID). No assurance level, conformance assessment or independent security review of the platform is published, and the page carries no date of its own. Enrolment is a five-second video of an identity card or passport page followed by a five-second video selfie, with no in-person step (enrolment). The platform was built on a commercial identity product under a 2022 project, after a 2014 public-key infrastructure contract with the same supplier (delivery).	NO CHANGE
Sierra Leone	Identity verification now gates services: banks were directed to enforce the national identification number in all transactions, and the permit portal requires registration. The central bank set commercial banks a deadline to enforce the identification number in all transactions (directive). The unified permit portal, the online channel for work and residence permits, requires registration for a number before an application can be made (portal). The verification platform behind this was launched with the first securitized multipurpose biometric cards in January 2023 (launch), and coverage stands at about 93 per cent with a live eKYC platform (coverage). No authentication volume, uptime figure or failure rate is published for any of it.	MOVEMENT
Somalia	Authentication is deployed and operational: real-time verification with fingerprint and facial biometrics and consent-based one-time codes through the verification portal. The authority's own current description states the service is deployed and operational, using real-time identity verification, fingerprint and facial biometrics and consent-based one-time passcodes initiated through the verification portal (description). Its director general described the same capability at an international conference in October 2025, naming the mobile identity application and a certificate delivery system alongside it (conference). No transaction volume, uptime figure or independent assurance is published for the service.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
South Africa	The online verification service is running with its fee under review litigation, and an investigation found adjudicators approving visas on fraudulent documents without verifying them. The online verification service is running, with its fee under review litigation, and no accuracy, volume or availability figure is published for it (service). The special investigating unit found home affairs adjudicators took payments to approve visas on fraudulent supporting documents without conducting any verification, flagging 205 visas for revocation and deportation with seven disciplinary referrals, under a 2024 proclamation covering almost two decades of visa and permit administration; it recommends reducing human intervention through technology and integrating departmental systems so verifications run automatically (investigation). Beneath both sits a missing layer: the state has policy, draft regulations and a presidential promise for a public key infrastructure, and no root of trust deployed, while Zambia and Namibia launched national root authorities in the same fortnight.	MIXED an online verification service runs while an investigation found visa adjudication carried out with no verification at all
South Sudan	Registration is being extended - school-based and by mobile kit - with no verification service on record. School-based national identity registration launched in August 2026 (schools) and mobile registration kits were deployed from April 2026 (kits). The immigration directorate's head set out a digital reform programme with a memorandum on an integrated registry (reform). Enrolment is not authentication. No verification interface, no relying party and no transaction count appears in the repository, and the identity legislation recorded separately does not provide for one.	MOVEMENT
Sudan	A national root key for the public key infrastructure was launched in March 2026, two months before the identity platform it underpins. The cybersecurity authority launched the national root key on 12 March 2026 as the trust anchor for electronic signatures and for verifying digital documents and certificates (launch). The identity platform's own description specifies multi-factor authentication using biometrics, a personal number and a QR code, with near-field registration integrated into government and service systems (description). The legal validity of the signatures rests on article 8 of the 2007 Act, as the platform's terms state (terms). Nothing states how many credentials have been issued. The national certification authority states that its root is in no browser trust store, so government domains are certified through a commercial partner while the root serves the passport trust chain (products).	MOVEMENT
Tanzania	147 institutions were linked to the identity register at April 2026, under 2023 regulations governing access. Government Notice 96 of 2023 is the operative instrument regulating external access to the identity register, the data-sharing contracts under which it is granted, and verification of identity information against it. The home affairs budget speech puts 147 institutions linked as at April 2026, against more than 138 across banking, insurance and social security in a July 2026 financial-inclusion report — two counts that are nowhere reconciled. Registration of vital events is framed by the responsible minister as the front end of the chain authentication depends on. No query volume, uptime figure or authentication-failure rate is published. The central bank backed a credit bureau's locally hosted fraud detection, anti-money-laundering screening and know-your-customer verification for Tanzanian lenders (backing). Local operation is the point: the checks run inside the country rather than offshore. No directive, licence or hosting requirement is held.	MOVEMENT
Togo	The identity agency holds exclusive authentication competence by statute; no authentication service, volume or interface is documented. Article 16 of the 2020 statute reserves authentication to the agency, and article 13 makes use of the number compulsory on every administrative document, extended by the 2022 amendment to every form and document the administration exchanges with persons and households. What actually operates between systems is a paper-and-convention route: the September 2024 order has a public body request access, sign a convention with the agency, obtain data-protection clearance and be logged, with quarterly reporting. The subscriber decree obliges operators to collect the number, not to query an authentication service. No verification interface, service level or transaction count appears anywhere in the repository.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Tunisia	The mobile identity credential became compulsory for investment declarations and business registration from 1 July 2026, and an agriculture ministry circular requires it across that ministry's online services by 15 November 2026. It was made compulsory for investment declarations and for business registration from 1 July 2026 (mandate, register, milestone). An agriculture ministry circular requires every body under it to integrate the credential into its online services by 15 November 2026, with its identifier the sole reference for any new service and strong multi-factor authentication. The public-services mobile application released at the end of August 2026 is reached through the same credential. No enrolment count since March 2025, coverage figure or fallback for a user without the credential is published.	MOVEMENT
Uganda	The single sign-on and e-signature platform publishes no usage figure at any date, and card verification was still failing in August 2026, five months past its deadline. The state platform is described by its own operator as a single sign-on, digital authentication and electronic signature platform, and in August 2025 the authority convened chief executives to drive adoption. No user, transaction or integration figure has been published. 2026-08 - the card's own verification is the harder finding. The authority had acknowledged in February 2026 that the code function was not integrated into its operational system and promised a fix by 31 March; in August members of parliament reported holders still turned away from banking and SIM services, and an added UGX 5,000 charge for a letter letting a citizen whose card cannot be verified have their details integrated. A charge levied because the system does not work is the sharpest thing held on this indicator, and no ministry response is on record. 2026-09-17 — the authority set out a digital signature service being built on the platform, binding the signature to the holder's national identification number so land documents can be signed digitally, with real-time verification carried to the registration authority so a lands office checks the register rather than a photocopied card. Forged signatures in land transactions are the first target; no launch date is published.	REGRESSED the authentication that exists on paper is failing in the field
Zambia	A national authentication service runs single sign-on, OpenID Connect, multi-factor and passwordless credentials for e-government. The state technology institute publishes the service description of the national authentication and access-control service: single sign-on, OpenID Connect, multi-factor authentication and passwordless credentials for electronic government services. An operating authentication service with named protocols is the strongest identity artefact on this ledger, and it is what makes the downstream uses recorded elsewhere possible. The page is undated, so the position is dated to retrieval, and no user count, uptime figure or list of relying services is published — so the repository can describe the service and not its reach.	MOVEMENT
Zimbabwe	Identity rests on the National Registration Act; a nationwide handover in August 2026 puts voter registration under the same authority and sub-offices are being computerised. The National Registration Act, consolidated to 31 December 2016, is the statute under which the register of residents and the issue of identity documents sit (Act). The civil registry department and the electoral commission began a nationwide joint transfer of voter registration and voters' roll management to the registrar-general on 18 August 2026, provincial and district officers of both bodies meeting in Harare to operationalise it (handover). The home affairs ministry announced in October 2025 that civil registry sub-offices would be computerised countrywide to safeguard citizens' records; ten sub-offices across eight districts are now being computerised, digitalised and solar-powered under a China-funded, UNICEF-managed project (announcement, project). No authentication service, credential or transaction count is published, and the national digital identity itself remains announced and unlaunched.	MOVEMENT

Digital id from birth

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	Civil status is automated nationally and its electronic documents are now compulsory to accept in the education sector, on a 2023 identification number. The chain from birth to credential is unusually complete here. The national automated civil status register issues documents that the education ministry told its directorates and schools in August 2026 they must accept in electronic form, and the national unique identification number was established by decree in 2023. What the repository does not state is whether the number is assigned at registration or later, and no birth registration coverage figure is published. The unified national digital identity is the layer above, with an electronic-identification law gazetted in February 2026. 2026-10-09 - the digitalisation commission set out how the national digital identity is obtained, by registration and appointment at the commune, activation and verification against the holder's biometric data.	MOVEMENT
Angola	Registry posts opened in maternity wards in one province so newborns leave registered and issued a first identity card, with no national rollout published. 2026-03-04 — registry posts in maternity wards were launched in one province, running there since October 2025, so that newborns leave registered and issued a first identity card, foreign-funded with United Nations support, following the start of card issuance to newborns in November 2025. No national rollout map, no registration count and no target is published, so what the repository holds is one province and a stated model. The universalisation programme reported under registration names cards at birth as one of its three phases, which is the nearest thing to a plan on file. The measure that would test it runs the other way: birth registration among children aged nought to four is the weakest cohort in the census, reported under the civil register.	MOVEMENT
Benin	The law requires every birth to be entered in the national register, with a personal identification number assigned on that registration; the single-window pilot reached 76.56% against about 22% nationally. The founding instrument requires every birth to be entered in the Registre national des personnes physiques and gives the child a personal identification number on that registration. 2026-02-25 — six months into the single-window pilot, the window was live in ten health facilities and had removed the parents' separate trip to an identification centre. The instrument is a decade old and the delivery is a ten-facility pilot; the gap between them is the finding. 2026-10-04 - the identification agency said a September campaign issued a first birth certificate to 50,109 children under 14.	MOVEMENT
Botswana	A unique number is issued at birth registration and becomes the Omang number at sixteen; no digital credential sits behind it. 2026-08-01 — the statistics office describes the birth and death registration system as partially automated and decentralised, integrated with the identification system, with the identifier issued at birth carrying through to the identity card at sixteen. 2025-11-25 — an electronic identity card was piloted and a feasibility study commissioned. No digital credential is issued at birth, and the repository holds no birth-registration completeness figure.	NO CHANGE a number from birth on paper rails
Burkina Faso	The 2025 family code assigns a unique electronic identifier to every natural person from birth registration, leaving the modalities to an implementing decree the repository does not hold. 2025-09-01 - the 1,113-article code creates a national digital civil registry and assigns a unique electronic identifier to every natural person from birth registration or from entry into that registry, leaving operational modalities to a subsequent implementing decree. It was adopted unanimously and mandates digitisation of civil-status records. The mechanism it formalises already exists in one form: every newborn receives a bracelet carrying a unique code that links to their digital birth certificate. 2026-06 - registry agents in a rural commune were trained on the national civil-registration software, moving that commune from digitised archives toward active digital registration. Against that, 60.65 per cent of births were registered within the two-month legal deadline in 2024, so nearly four in ten children start outside the deadline the identifier attaches to.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burundi	The civil registry's link to health facilities now runs in 123 facilities and has recorded more than 52,000 births, on the interior ministry's own count. 2026-08-11 — the civil-registry to health-facility link for birth registration, piloted since 2023 and institutionalised in 2024, is stated to run in 123 health facilities and to have recorded more than 52,000 births. The figures are the ministry's own and no coverage denominator is given, so the share of births captured is not knowable from the record. A national unique identifier is planned with fingerprint and facial biometrics, which would be the link from registration at birth to a credential. Nothing states when, or how a child registered through a health facility today obtains one.	MOVEMENT
Cameroon	Digital birth certificates began to be issued under a system covering ten municipalities in three regions from January 2026. A drive to reach one million pupils without a certificate was found far from its target and restarts in September 2026. The certificates were provided for in the 2024 civil-registration law with none issued at the window's opening. The first was issued at a Limbe council in January 2026, and issuance has begun under a system covering ten municipalities in three regions, with the same legal worth as physical certificates. 2026-08-07 - equipment for three pilot centres digitising civil-status registration went out to tender by the United Nations development programme, the centres, their locations, the value and the timetable not named. Three pilot centres is the whole of that scope, against a register the repository elsewhere records being used to draw fraudulent payroll claims. 2026-08-26 — a drive launched in 2024 to reach one million pupils holding no birth certificate was found far from its target, and the Basic Education minister ordered pupils' files submitted to the courts before 15 September, restarting mobile court hearings from September. No count of certificates issued under the 2024 drive is published, so the shortfall is stated and not measured. The court route is not discretionary: the law requires a declaratory judgment wherever the 90-day deadline was missed.	MIXED digital birth-certificate issuance began under a system covering ten municipalities while a one-million-pupil registration drive missed its target and restarts
Cape Verde	Birth registration reached 99%, with a unique identification number issued to every child at birth, from about 91% before the linkage reforms. Coverage stood at about 91% before the linkage reforms, with fragmented systems and weak institutional coordination. 2026-05 - the justice-modernisation institute reported 99% birth registration and 100% registration of deaths occurring in health facilities, reached within five years, with a unique identification number issued to every child at birth. The figures are the institute's own and are registration coverage, not identity-card coverage. It is the strongest measured position on this ledger, and the only one on it where a stated outcome rather than an instrument has moved.	MOVEMENT
Central African Republic	Registration is being caught up by late campaigns rather than at birth; no identifier is issued at the birth event. What the repository holds is the opposite of registration at birth: a late birth-registration campaign reporting 61,000 additional registrations in the capital prefecture, catching up people already born. No system issues an identifier at the birth event. The health system does assign one - an electronic medical record deployed with the health ministry assigns each patient a unique identification on registration - but it is the clinical record's own number and nothing links it to civil registration or to the national identifier.	NO CHANGE a first stated position with no earlier account behind it
Chad	A child birth-registration campaign opened a six-month first phase, backed by a moratorium on court fees for supplementary birth judgments until 2030. The campaign runs a first phase of six months to December 2026; one account puts its household component in twelve provinces and another says every province (campaign, registration, identity). The fee moratorium was signed in February 2026, suspending court fees for children aged four months to seventeen years until 2030; the instrument's own text is not held and its terms are known only from launch statements (moratorium). Health-facility-integrated registration is reported by a practitioner, with stated plans to raise digitised hospital points from ninety-seven to six hundred and reach zero unregistered births by 2030 (facilities), and a francophone civil-registration project has a second phase in preparation on the organisation's own claim (project).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	A birth-registration campaign was launched in September 2025 above a 2023 law providing for computerised civil status. The legal basis is in place and the system is not. The law promulgated on 25 September 2023 amends the 1984 civil-status law to provide for computerised processing of civil-status data, a national civil-status and population register and a civil-status agency; the agency is still a draft decree in island consultation. 2025-09 - a campaign was launched in Moroni to raise birth-registration rates, particularly in remote areas, run with the national human rights commission. 2026-08 - at the African civil registration day the interior minister and the modernisation project's coordinator tied digitised registration of newborns in rural communities to legal identity. No registration rate is on file at either end.	MOVEMENT
Congo	The integrated civil-status system is designed to follow a person from birth to death, and it remains in development. The state information systems agency's own product record describes the integrated civil-status system as designed to follow a person from birth through marital life to death. The ledger carries that system as in development. No birth registration rate, and no figure for identifiers issued at birth, appears at either end of the period.	MOVEMENT
Cote d'Ivoire	283 digital birth-registration terminals were handed to Tonkpi health workers to link maternities to civil-registry offices. 2026-08-11 - the identification office handed 283 digital birth-registration terminals to health workers in the Tonkpi region to link maternities directly to civil-registry offices under a zero-invisible-child programme, part of a digitisation the office also reported in the Goh region. 2026-06-09 - national-language announcers were trained as community relays on civil registration and the identification number, with community collection points to follow; no number of speakers trained, budget or coverage is stated. No registration outcome is attached to either: the terminal count and the training are inputs, and the on-time registration rate they exist to move has not been republished. The number's own basis in civil registration is a 2019 decree: the national identification number is generated during automated processing of civil-status data and assigned on registration in the national register of natural persons, so the identity is minted at the registration event rather than issued separately afterwards. What the repository does not hold is any figure for how many births are processed that way, against a civil-registry rollout the identification office reports by centre count and not by record.	MOVEMENT
Djibouti	The identification number is assigned from birth by law; civil registration that would trigger it stays largely paper-based. The rule has stood since before the period: the founding law assigns the national identification number from birth, and its implementing decree defines it as a digital instrument combining civil-status and personal data and requires it on property, hospital, school, university, utility and commercial records. What the repository does not hold is the mechanism. A comparative regional report finds no electronic records in local civil-registration offices for births or deaths, no central national civil-registration database, and paper-based transmission between registration levels and institutions. No birth-registration rate, and no count of numbers assigned at birth, is published.	NO CHANGE
DR Congo	A rural eastern sector has had no birth registers for several months and newborn registration has stopped outright. 2026-07-25 - a sector chief told the provincial interior division that his civil-status office has had no birth registers for several months, that newborn registration has stopped outright, and that the province promised resupply with no date. The stated consequences are exclusion from school enrolment and from proof of nationality. It is the concrete measure of how far civil-registry modernisation reaches into rural territories, and it runs in the same year a national digital identity platform launched in Kinshasa. No registration rate, register-stock figure or resupply programme appears anywhere on this ledger.	REGRESSED

COUNTRY	DEVELOPMENTS	PROGRESS
Egypt	An electronic birth and death registration system was recorded as under way from 2017; no identifier at birth is stated. An electronic birth and death registration system was recorded as under way from 2017, and the country's own submission puts birth registration completeness at 96.6%. Registration is close to complete and nothing states that an identifier is issued at the birth event, or that the civil status system and the identity system exchange at that point. The country's own presentation contrasting 2017 with 2026 is the fullest account held and it does not close that question.	NO CHANGE a first stated position with no earlier account behind it
Equatorial Guinea	Birth registration coverage passed 90 per cent from administrative records for 2024, from 46 per cent unregistered in 2019. The starting point was poor: 192,000 birth records digitised to 2019 with 46 per cent of children unregistered. The second vital events report of September 2025 puts birth and death coverage above 90 per cent from administrative records for 2024, drawn from hospital and community data. Registration is not an identifier, though: no number is assigned at birth and the registry law dates from 1957.	MOVEMENT
Eritrea	The card is issued from age 18; birth registration feeds the zoba population registers, which also record the identity number. There is no credential that follows a person from birth. Civil registration of births exists and is partial; the identity card is a separate document issued from age 18 by the immigration and nationality department at a fee of 100 nakfa. The registers that do exist are held at zoba level, and birth registration reaches them through the local family register.	NO CHANGE
Eswatini	The Closing of the Tap initiative registers newborns inside health facilities under the Civil Registration Act of 2023, with offices in seven towns. The ministry's own retrospective describes the Civil Registration Act of 2023 and an initiative registering newborns directly within health facilities, with registration offices now open in seven towns (ministry). A unique identification number is issued at birth and appears on both the birth-registration record and the birth certificate (scoping study). Registration completeness stands at 61 per cent of births in 2025 (commemoration), so the pathway exists for rather more than half of newborns. What is issued at birth is a number and a certificate, not a credential: the identity document itself comes at 16 under the 1998 Order, and no count of births registered through the health-facility route is held.	MOVEMENT
Ethiopia	Birth registration is being extended operationally, including backlog clearance for refugee children in Afar (mission). A joint field mission by the refugee service with UNICEF, UNHCR and the Immigration and Citizenship Service cleared birth-registration backlogs and assessed service delivery for refugee children in Semera and Asayita refugee camp in April 2026 (mission). The government's own account of civil registration digitalisation describes family and vital-event registration running digitally from the central level down to woreda level (statement). The repository holds no birth-registration rate, and nothing states whether a registered birth produces a national identity number, so the link this indicator asks about is not evidenced either way.	NO CHANGE a first statement of the position with nothing measuring registration at birth
Gabon	A joint programme registers birth certificates for people without civil status and enrols them with the health insurance fund: 500 files in one province, 486 sent for supplementary judgments. 2026-09-01 - a field mission by the director general of social welfare across the nine departments of one province carried dated operational figures: 500 files registered province-wide, 486 transmitted to the court of first instance for supplementary judgments, and 100 birth certificates ready for collection. The programme is described as guaranteeing every citizen the right to identity and to social protection. The ratio is the finding: nearly all the files needed a court to establish a birth that was never registered. Registration at birth is not what the programme is fixing; it is fixing its absence, years later. The institutional frame is being redrawn around the same problem: two draft decrees taken in December 2025 reorganise who governs ministerial systems and create an infrastructure and cybersecurity directorate, and the civil status statute which provides for a digital and biometric civil registry has produced no birth-registration rate the repository can cite.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Gambia	Registration is the entry point in law — a birth certificate supports the identity card — with no identity number issued at birth. The government's own statement of the credential chain makes the birth certificate the document that supports an identity card and then a passport. That is a paper chain, not an identifier assigned at birth. The electronic civil register has scale — more than 1.4m cumulative registrations by June 2026 — but the figure is cumulative rather than a coverage rate, and no link from a birth record to a national identity number is recorded as operating.	NO CHANGE
Ghana	A renewed registration application for children aged nought to five was tested at health facilities in August 2026, resuming a programme launched in 2024. 2024-03-14 - the number-at-birth system was launched, integrating the health service tracker, the births and deaths registry and the identification authority so newborns receive a unique personal identification number linked to the mother's identity and to a birth-registration number. It was then suspended after a technical fault. 2026-08-11 - the authority, the registry and the health service successfully tested a renewed registration application for children aged nought to five at health facilities, with nationwide issuance at health facilities expected to follow. No rollout date, facility count or issuance figure is published, so what the repository holds is a working test two and a half years after the launch it resumes.	MOVEMENT
Guinea	Birth registration was put at 72 per cent for 2025 from 54 per cent in 2022, on a base where communes ran out of secured paper. The figures are the territorial administration minister's own, given in a ceremonial statement with no statistical source named (minister's figures). A civil-registration officer said on 7 August 2026 that the secured paper the digital birth certificate is printed on had run out, leaving communes across the capital and beyond unable to issue extracts for about a month; his own commune processes all applicants regardless of home commune and holds reserve stock for urgent cases (stockout). No ministry statement, restocking date or national count of affected communes is held.	MIXED the registration rate rose while the paper the certificate is printed on ran out
Guinea-Bissau	Birth registration now happens at school enrolment and in health services, which registered 20,000 children in nine months. Two service points were added to the register in the window. The justice and education ministries agreed in August 2025 to issue birth registration at the moment of school enrolment, and more than 20,000 children were registered through health services in the nine months to June 2025. A third mobile justice caravan using the digital registration system launched in June 2026 for children's birth registration. Registration is not an identifier: no number is assigned at birth on the record.	MOVEMENT
Kenya	The birth-notification system registered more than 270,000 newborns in its first two months, and a statute mandates a civil-registration office in each of 290 sub-counties, with the identifier issued at birth feeding automatic identity at 18. The amendment Act was assented in February 2026, shifting vetting to birth registration (statute, reform direction). A digital birth-notification system linking hospitals to the registry began in one Nairobi hospital (pilot) and, extended from June 2026, registered more than 270,000 newborns with unique personal identifiers in two months; integration with the health ministry's hospital system is planned. No facility count or county coverage is published. 2026-10-06 - the immigration principal secretary said electronic birth notification will reach every insurer-contracted hospital by December 2026.	MOVEMENT
Lesotho	A unique personal identification number is issued on birth registration, with a scale-up roadmap to 2030. 2011-03-21 — the founding Act provides for a unique identity number at registration, including for children entered through a parent or guardian. 2026-07-18 — the registry's own presentation states a unique personal identification number is issued on birth registration, with a nationwide scale-up roadmap running to 2030. 2026-04-01 — a proposal was put to use maternal health records to trigger earlier birth registration. No birth-registration completeness figure is published, so how many children the number actually reaches cannot be stated.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Liberia	A UNICEF-funded pilot issues identity documents to under-sixes in three counties, free to parents. The registry changed its system in June 2023 to issue unique identification numbers to children under six, and a UNICEF-funded pilot was inaugurated on 16 January 2025; by the registry's March 2025 account the pilot dated from September 2023 and had enrolled 5,000 children in Montserrado, with Grand Bassa and Gbarpolu to follow. It pilots in Montserrado, Grand Bassa and Gbarpolu, funded by UNICEF for an initial 5,000 children at no cost to parents, with the health ministry issuing free birth certificates alongside. The fee is the reason it exists: ordinary enrolment carries a US$5 charge that put registration out of reach. No national rollout, budget line or successor cohort is on the record.	NO CHANGE
Libya	Law 8 of 2014 makes the national number mandatory from birth; no birth-to-number workflow is described. The statute is unambiguous that the twelve-digit number attaches from birth and is required for every state service, so the entitlement exists in law. What the repository does not hold is any account of how a birth becomes a number in practice. The registry match across 257 offices was a reconciliation of existing records, and the project remained unfinished in July 2026.	NO CHANGE
Madagascar	A unique identification number at birth has been mandated in law since 2018, with assignment mechanisms only now in place. Article 38 of the civil status law of November 2018 mandates a state-issued unique identification number assigned to every person at birth, applicable nationwide (law). The repository holds no figure for how many newborns have been assigned one, no registration completeness rate, and no account of the mechanism by which a birth declaration generates the number. The capture stops at article 111 of 152, so the law's later provisions on the registers and their maintenance are not in the repository.	NO CHANGE
Malawi	58 health facilities issued point-of-care digital birth certificates in 2025, with registration assigning a lifelong identity number. The UN agency's own account of 10 October 2026 puts the registration application, which links civil registration to identity management, in pilot at 87 locations across five districts, with 250 planned by 2028. The bureau's plan treats birth-to-identity linkage as a 2025-2030 objective, with birth registration being integrated to assign a national identity number at birth. 2026-02 - 58 health facilities issued point-of-care digital birth certificates during 2025, 104,177 births registered and 56,268 certificates issued, with registration now assigning a lifelong identity number. Certificates run at just over half of registrations and nothing on file explains the gap. 2026-07 - the third phase of the national campaign was under way with cumulative registration past 3.5 million children of an estimated 7.5 million eligible. Under half the children in the country have been reached. 2026-10-09 - UNDP handed over 152 printers to decentralise birth, marriage and death registration, the minister saying 180 health facilities had already been digitalised.	MOVEMENT
Mali	A community birth registration arrangement for remote areas was presented in July 2026, and the country set out a modern and resilient civil status system in August. Community health workers notify perinatal deaths and births through an electronic platform in four health districts on a peer-reviewed account (study). No registration rate, notification volume or coverage of the arrangement is published, and the repository separately holds fewer than half of births registered on an older measure — so what has moved is the method and not yet the number.	MOVEMENT
Mauritania	The 2025 amendment to the civil status code provides for digital acts, over a population register at 5.1 million. The legal chain from birth to credential is being closed. The civil status code, itself resting on the 2011 law that created the national population register, was amended in February 2025 to provide for digital civil-status acts. The interior directorate's first-half 2026 report describes biometric interconnection with civil status. The register reached 5.1 million enrolled on the account given to parliament in June 2026, where the same sitting heard that exclusion from civil status remains. Registration at birth as such is not separately measured.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritius	The 1985 identity card Act governs issue, and the repository holds no provision assigning an identifier at birth. The Act has been in force since April 1986 (Act). Statistical and registry measures were carried in the 2026-2027 budget annex (annex). What the repository does not hold is any provision assigning a unique identifier at birth, any linkage rule between the birth register and the card, or a figure for how many newborns are registered. The card is an adult instrument on the record as it stands.	NO CHANGE
Morocco	Law 36.21 creates a birth-linked identifier, and its implementing decree operationalised the platform. The 2021 law creates a national digital civil-status register and an identifier attached at birth, and the 2023 implementing decree put the platform into operation. The legacy stock is what remains: the interior ministry gave ten regional governors three weeks in October 2025 to digitise paper civil-status registers, a deadline the minister restated in the same month.	MOVEMENT
Mozambique	A mass campaign launched in March 2026 targets up to 7 million citizens by December through 500 mobile brigades issuing a birth certificate and, first time round, the identity card on the spot, free of charge. 2026-03-20 — the justice ministry launched a mass civil-registration campaign of about US$9m targeting up to 7 million citizens by December 2026, through up to 500 mobile brigades that jointly issue a birth certificate and, for first-time applicants, the national identity card on the spot and free of charge. Issuing both in one encounter is what makes this an identity-from-birth movement rather than a registration drive. The system behind it registers births and deaths by USSD, SMS and web, coordinated across justice, health, interior and the statistics institute, with the stated objective of a single lifecycle citizen identification number linking civil registration to civil identification. 2026-04-27 — a package of memoranda with Ethiopia covered digital transformation with a stated emphasis on digital identity and public infrastructure, bringing another country's identity-system experience into the build. No registration figure against the 7 million target is yet published.	MOVEMENT
Namibia	A unique identity number is created for every child notified at birth, and electronic notification now runs across 153 facilities. The population registration system creates a unique identity number for every child notified at birth, from the electronic birth-notification rollout of 2016 to 2018 onward (case study). Electronic birth and death notification operate across 153 facilities on the home affairs minister's account, with birth-registration coverage put near 99 per cent (coverage). Staff were deployed to 24 state hospitals in December 2025 to issue certificates immediately after delivery (hospitals). A mobile identity prototype was tested so a remote mother could register a newborn by phone with a digital signature (prototype). 126,737 birth certificates were issued in calendar 2025 (documents). What is issued at birth is a number and a certificate; the credential comes later, and from September 2026.	MOVEMENT
Niger	Timely birth registration has risen from 53% to 79% since 2022, with the population register to become the single authenticating base. The ministry's campaign launch at Tahoua in August 2026 states that timely birth registration has risen from 53% to 79% since Niger joined the regional identification programme in 2022, that the population register will become the single interoperable base authenticating each citizen through a personal identifier, and that rollout begins in Niamey with national extension from 2027. The programme's steering committee validated an interim 2026 work programme and budget of over 12 billion FCFA on 24 February 2026 for six months to catch up delays, reporting 95.19% physical completion across its three components. No birth registration issues a digital identifier today; the chain from registration to credential remains in implementation.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	The registration platform is live nationwide from 1 July 2026 with about 57% of births registered, on a 2026 identity Act. The population commission's platform went live across all 36 states and the federal capital territory from 1 July 2026, the commission reporting about 57% of births currently registered — the first registration rate the repository holds against the digital chain. A pilot in Gombe State trained personnel from 114 health facilities and 114 wards to capture births electronically and integrate registration with identity enrolment. The legal footing is the identity Act assented in June 2026, which makes the national identification number the foundational credential. No figure for identity numbers actually issued at birth registration is published.	MOVEMENT
Rwanda	The 2023 law links children under five through a guardian's identity number, and the new credential launched nationally in August 2025. The statute provides for children under five to be linked into the single digital identity through a national identification number held by a guardian (law). The credential itself was launched nationally in August 2025 (launch), and the integrated civil registration system launched in June 2026 moved registration authority from sector to cell level and made it interoperable with the national population registry (launch). No figure is published for how many children have been linked, so the provision's reach cannot be stated.	MOVEMENT
Sao Tome and Principe	Birth registration is entered electronically at every maternity unit, free up to one year, with 3,077 births registered in 2025. The chief conservator of the civil registry states that free birth registration up to one year is available in every maternity unit in the country, staffed by directorate technicians and trained midwives, and that an electronic system now allows registration to be entered directly into the database from computers and printers at those points, eliminating paper (registry). He gives annual birth registrations of 3,077 in 2025, 4,701 in 2021, 3,954 in 2020 and 4,374 in 2019 (registry), and describes campaigns aimed at mothers who give birth at home and so miss registration at the maternity. The country diagnostic records the centralised civil registry database as holding birth data from 1920 to 2010 (diagnostic), so the digitised historic series stops fifteen years before the electronic present. Nothing links a birth record to an identity credential issued at birth.	MOVEMENT
Senegal	The externally funded civil-registration modernisation programme closed at a final steering committee in June 2026 — a programme closure rather than a capability closure. The final steering committee was held on 29 June 2026, closing the programme (closure, programme). It is the only European governance instrument on file for the country. The capability it built continues — software is deployed across most centres and millions of records are loaded — but the financing that built it has ended, and the agency running it says its own 2026 budget has not been notified. 2026-09-23 - the civil-registration promotion body said 58,462 candidates sat the primary-school leaving exam without a civil-status record, with 7,823 at the lower-secondary exam and 98 at the baccalaureate. The exam year is not stated.	STALLED
Seychelles	Digital identity is not issued from birth: a citizen applies for a physical card with a birth certificate, then separately enrols for the digital one. The department's own current procedure states that a Seychellois citizen applies for a National Identity Card for the first time using a birth certificate, and then separately signs up for a virtual identity once the identity number and physical card are issued (procedure). The wallet's Minor ID lets a parent or guardian activate a child's virtual card, but against an existing national identity number rather than at registration (Minor ID). So the chain runs birth certificate, physical card, then digital credential, with a separate enrolment step at the end that nobody is obliged to take. Birth registration is in person at a regional office within 30 days, on a paper maternity certificate and the parents' identity cards (procedure). No digital route and no electronic link to the population database is published.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Sierra Leone	The civil registration authority announced that the Maternal and Child Health Handbook will be valid for birth registration, routing registration through the health contact. The Director General announced the recognition at a high-level coordination meeting in Freetown on 5 March 2026, sponsored by the health ministry, JICA and UNICEF; the handbook was piloted in selected districts from 2019 to 2021 and adopted as a national standard in 2022 (handbook). It is an announcement, not an instrument. No regulation, circular or commencement date gives it effect, and no registration figure is published against it.	MOVEMENT
Somalia	A civil status law was gazetted in April 2026 and a ministerial briefing followed; registration of under-twos was 4 per cent at the last measurement. The last coverage figure the repository holds is from a country profile finding no operational national civil-registration office, 4 per cent of under-twos registered, and the relationship between civil registration and digital identity still at policy-design stage (profile). Law No. 46, gazetted 5 April 2026, puts civil registration and vital statistics on a statutory footing beside the identity infrastructure (law). The interior ministry's registration directorate briefed the minister in June 2026 on service expansion and implementation of the law (briefing); a centralised platform for birth and marriage certificates was announced in February as beginning the following year (announcement).	MOVEMENT
South Africa	680,555 babies were registered within 30 days of birth in 2025/26 against a 677,000 target, with automation in health facilities still planned. 2026-05-15 — 680,555 babies were registered within 30 days of birth in 2025/26 against a target of 677,000, with automation of the birth process in health facilities still planned for 2026/27. It is the department's own figure and no total-births denominator is given, so the share registered in time is not derivable. The statutory basis is old and unchanged: the Births and Deaths Registration Act has been in force since 1992, held as an excerpt. The link to a credential is what the white paper reported under interoperability proposes to build; today the registration is timely and the identity that follows from it is a separate transaction.	MOVEMENT
South Sudan	The civil registry directorate announced plans to link birth registration to the identity system for real-time registration. The directorate announced plans to digitise civil registration and link it to the national identity system for real-time birth registration, coordinating the health, justice and interior ministries, in response to recommendations in an identity diagnostic (plans). A plan with three ministries named and no instrument behind it. No birth registration rate, no pilot and no timetable is published against it.	MOVEMENT
Sudan	A joint health and civil-registry committee was formed in March 2026 to record a citizen from birth to death; nothing yet operates. The health ministry's undersecretary and the civil registry's director agreed on 16 March 2026 to form a joint higher committee and technical subcommittees, and to prepare a new memorandum, to restore and develop electronic linkage between the two systems, with the stated goal of recording a citizen's health status in the national registry from birth to death (agreement). The hospital management system launched in May 2026 integrates civil registration and vital statistics at two hospitals (launch). At locality level the first electronic birth certificate after the war's suspension was issued in South Gezira (certificate).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tanzania	Registration from birth is in pilot with under-fives linked to the mother's identity because no biometric solution works for them, and the pilot ran about six months ahead of its enabling bill. The registration agency and identity authority are linking to issue the identifier from birth; under-fives are linked to the mother's identity, and as at August 2026 the minister reports over 22 million people holding a national identification number as of April 2026 and describes the two agencies' integration as the route by which the identifier is issued from birth, with no integration milestone, date or technical description accompanying it (pilot, children, rollout). The enabling bill was set for a session opening in January 2026 and was not tabled; one source's headline says the scheme rolls out where its body says only that government is preparing to table, and the body governs (bill, registration). The identifier as a distinct issued credential was named a 2026/27 budget priority, having been declared design-complete in March 2024 with an end-2025 conclusion target (identifier, design). 2026-09-16 — the identity authority restated its plan for a Jamii Namba carrying social services, with no identifier yet issued. 2026-09-16 — the Prime Minister directed the identity authority to drop the age bar and register young children; no start date is published.	MIXED a from-birth registration pilot running about six months ahead of the bill that would enable it
Togo	Two catch-up campaigns regularised 11,461 children between November 2025 and July 2026, against a stated target of about 7,400. The first campaign launched at Bagbe on 12 November 2025 aimed at 5,000 pupils without a birth certificate across 25 of the 117 communes, 200 a commune, by awareness sessions, itinerant hearings issuing supplementary judgments, then transcription at civil-registration centres. The second, launched at Agbandi on 31 July 2026, regularised 6,461 more. The ministry states plainly that many children, particularly in rural areas, remain without the document despite the reforms. The scale of the problem is the country's own: 22 per cent of under-fives without a birth certificate, 31 per cent in rural areas, an estimated 400,000 children.	MOVEMENT
Tunisia	A citizen unique identifier is assigned to every Tunisian in the civil-status birth register, with no issuance figure published since. A 2020 decree-law created the register of the citizen unique identifier, held by the ministry of local affairs, assigning an identifier to every Tunisian registered in the civil-status birth register including births registered abroad through diplomatic and consular missions, with the data-protection authority's opinion required before the technical specification and usage rules are set, and an implementing decree three days later fixed the identifier's content, technical specification and register rules. A restricted Council of Ministers in April 2026 directed development of digital consular services including remote registration of births, deaths and marriages abroad. No issuance figure, coverage rate or measure of how far assignment at birth actually reaches is held.	NO CHANGE the register's legal basis is unchanged and nothing states what it has issued
Uganda	Identification numbers are issued at birth by statute and in practice: registration teams were deployed to referral hospitals and 636,000 children enrolled. The obligation is statutory: the Registration of Persons Act 2015 provides for allocation of a national identification number when a citizen child's birth is registered. 2025-09 - during the mass enrolment exercise the authority deployed registration teams to referral hospitals to register births and issue numbers on the spot. 2026-01 - by January 636,000 children had been enrolled, alongside 21.4 million of the 28.5 million records held on the old system being transferred to the new one, with hospital-based newborn registration centres in operation. What none of these accounts carries is a denominator: no source here states what share of births is registered, so the number of children enrolled cannot be read as coverage. The status report carries the completeness figure this repository does not.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zambia	Civil registration funding was raised 67 per cent after advocacy, against only 22 per cent of under-fives with registered births. The Births and Deaths Registration Act of 1973 requires uniform registration of every birth and death, the statutory root from which a birth-time identity number would derive. 2026-05 — advocacy reversed a proposed cut and secured a 67 per cent funding increase for civil registration in the 2026 budget, and helped establish a 26-member parliamentary caucus in October 2025, explicitly framed as the foundation the digital identity reform needs, since only 22 per cent of under-fives have registered births and 15 per cent in rural areas. Those two percentages are the finding. An identity number issued at birth reaches roughly a fifth of children, and a budget increase is the first movement toward changing that.	MOVEMENT
Zimbabwe	Birth registration stands at 57 per cent, and ten rural sub-offices are being computerised to widen access to registration at the point of birth. The Births and Deaths Registration Act, in force as amended to 6 March 2020, requires registration of births, still-births and deaths (Act). Birth registration coverage stands at 57 per cent, with no later national figure held (coverage). Ten decentralised civil registry sub-offices across eight districts are being computerised, digitalised and solar-powered under a China-funded, UNICEF-managed project, aimed at children and families in remote communities who need legal identity documents to reach health, education and social protection (project). A provincial registry office commissioned in Mutare in September 2025 for biometric passport and identity services was described by the registrar-general as foundational to a digital identity system (registry office). There is no identity credential issued at birth: registration produces a paper certificate, and the identity document comes later.	MOVEMENT

Interoperability of birth registration and digital id

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The education ministry made electronic civil-status documents compulsory to accept in its directorates and schools: interoperability enforced by instruction rather than by interface. Algeria has joined registration to identity by obliging bodies to accept the output rather than by connecting the systems. The education ministry's reminder that electronic civil-status documents must be accepted is the operative mechanism, over a nationally automated civil status register. The technical route exists in parallel and is not yet described as carrying civil status: the national interoperability system in development, for which the Council of Ministers ordered a presidential decree on 20 September 2026, extended to the wilayas, and the unified national digital identity keyed to the 2023 identification number. No source states that a registration event creates or updates an identity record automatically. 2026-10-09 - the digitalisation commission set out how the national digital identity is obtained, by registration and appointment at the commune, activation and verification against the holder's biometric data.	MOVEMENT
Angola	The identity card is generated from the birth record by system interoperability, a link standing since 2017 and unmeasured since. The link exists and is old. The card is generated from the birth record by system interoperability, on a platform installed with foreign assistance in 2017 that tied card issuance to birth registration from the start. Nothing in the twelve months to 2026-08-26 states how well it works. No figure exists for how many registrations produce a card, how long the step takes, or what happens to the 39.2% of children aged nought to four registered at the 2024 census — the population the link is supposed to serve. The maternity-ward posts reported above are the operational answer being built, and they are in one province.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	Secure birth certificates are now produced from the national register's own data, and the single window removed the separate trip to an identification centre. 2026-05-06 — an agency instruction formalises that secure birth certificates are produced from register and civil-registry data, and that enrolment requires a birth certificate or supplementary judgment plus reconstitution of old certificates. 2026-02-25 — the single window removed the structurally blocking step, the parents' trip to an identification centre after a birth. The two registers are joined in procedure as well as in law, which is what this indicator asks. 2026-10-04 - the identification agency said a September campaign issued a first birth certificate to 50,109 children under 14.	MOVEMENT
Botswana	Online registration of births, deaths and marriages is complete and waiting on the government platform to go live. 2015-09 — a country report set out the identity lifecycle from birth registration through to the identity card at sixteen, the repository's fullest technical account of the link. 2026-02-24 — the ministry reported digitisation of online birth, death and marriage registration complete, awaiting the government platform's go-live. The marriage register is still manual, and no go-live date is held.	MOVEMENT
Burkina Faso	The code ties the unique electronic identifier to birth registration, and the civil-registration strategy reports 3,710,617 records digitised across 30 communes by end-2025. The legal join is made: the code mandates digitisation of civil-status records and the creation of personal identifiers, laying a basis for a civil-registry identity reference usable across public data systems. 2026-06-25 - the civil registration strategy's steering committee reported for 2025 that the national registration software was deployed in 30 main and 140 secondary centres with 78 main centres networked, 3,710,617 civil-status records digitised across 30 communes, and 128,051 birth certificates issued to previously undocumented and vulnerable people; financial execution ran at 81.83 per cent against physical execution of 45.55 per cent. That gap between money spent and work done is the strategy's own account of itself. The identity side is at a different stage: the decree organising nationwide mass biometric enrolment was adopted and a vendor recruited. No source states that a birth registration yet produces an identifier the identity system recognises. 2026-10-09 - the digital-transition minister said enrolment for the digital identity, budgeted at over FCFA 40bn, was due to start in October 2026.	MOVEMENT
Burundi	The country's own account states civil registration is not yet interoperable with the future digital identity; interoperability with health facilities is planned. 2026-07 — Burundi's country presentation to the African registrars general meeting states the position plainly: paper-based and manual elements persist, there is no single national civil-status database, and civil registration is not yet fully interoperable with the future national digital identification system. 2026-08-10 — the territorial administration directorate set out planned interoperability with health facilities for births and deaths, with notification through hill chiefs, alongside a national digital identity carrying a unique identifier and biometrics. The two accounts a month apart give the shape of it: the link is designed and not built, and the register it would connect to does not yet exist as a single database.	MOVEMENT
Cameroon	An implementation partner was engaged for civil-registration digitisation with a 2029 target, to integrate with the biometric card and the voter kits. No implementation partner was named at the window's opening. In October 2025 one was engaged, with a fully digital target for 2029 and a stated intention to integrate with the biometric identity card and the voter enrolment kits. That is the only stated link between civil registration and the identity credential anywhere on this ledger, and it is an intention with a four-year horizon rather than a built interface. No design, standard, milestone or interim deliverable has been published, and the event date is month-precision only.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cape Verde	The card's data is drawn from the birth registration act and its civil identification number generated through the national identification system; 290 birth certificates were issued remotely in the justice portal's first usage figures. The link is statutory. The card is optional from birth and compulsory from age four, its civil identification number is generated through the national civil identification and authentication system, and the data printed and encoded on it, filiation included, is drawn from the birth registration act. Coverage on the registration side is high: 99 per cent birth registration and 100 per cent registration of deaths occurring in health facilities, with a unique identification number issued to every child at birth. 2025-12-16 - the justice ministry published the first usage figures for its portal: 905 acts performed without any physical attendance at a conservatoria, of which 290 birth certificates and 150 identity card renewals — the two ends of the chain served through one channel. What is not held is the throughput of the link itself: no count of identity numbers issued at registration, and no identity-card enrolment or mobile-credential activation count at any date.	MOVEMENT
Central African Republic	Civil-registry archives are being diagnosed before digitisation; no link to the identity system is held. 2026-03-30 - a national physical-archiving expert was recruited to diagnose civil-registry archive holdings across registry centres, courts, health facilities and justice bodies - the step before any digitisation of what those holdings contain, let alone a link to an identity system. 2026-07-17 - agents were trained in scanning and securing communal and judicial civil-registry documents. Scanning is not interoperability. Nothing on this ledger records a birth record passing to the identity system, or an identifier being issued from one.	NO CHANGE a first stated position with no earlier account behind it
Chad	A campaign launched July 2026 aims to give a million children a birth certificate carrying a national identification number. The operation launched on 24 July 2026 aims to register and issue a secured birth certificate carrying a unique national identification number to at least a million children aged four months to seventeen, in a first phase across twelve provinces (campaign). The frame beneath it is the 2013 civil registration law, the 2016 ordinance creating the identity agency with civil registration among its missions, and a 2017 decret (bulletin). A workshop of 25 February 2026 laid groundwork for interconnecting the courts of first instance with the biometric register and covered access to supplementary judgments (workshop) — a reflection stage, with paper village registers still on the table.	MOVEMENT
Comoros	The 2023 law provides for a national civil-status and population register; the identifier meant to join it to identity is unissued. The law provides for computerised civil-status data and a national civil-status and population register, and the personal identification number provided for by the same law was designated the cornerstone of citizen identity, with interoperability to other state systems specified, at a validation workshop in March 2026. No issuance date, coverage target or numbering scheme has been published since. 2026-08 - the civil registration day ceremony tied digitised birth registration for rural newborns to legal identity, which is a statement of intent rather than a link built. A register that exists in law and an identifier that exists in a validated framework do not yet meet.	NO CHANGE the number designed to link them is still at framework validation
Congo	Financing for the digital transformation acceleration project was ratified in October 2025, on a civil identification directorate established in 2022. 2022-06-02 — the civil identification directorate was established by order. 2025-10-30 — financing for the digital transformation acceleration project was ratified, which is the vehicle for the integrated civil-status system. The system is in development and no interface between birth registration and the identifier is yet recorded.	MOVEMENT
Cote d'Ivoire	At the new terminals a parent's national identity card populates the child's identity data directly - the only stated link between the two registers. 2026-08-11 - the civil-registry office presented terminals for systematic birth registration on which a parent's national identity card populates the child's identity data directly, at the ninth African civil registration day. The claim to be the first in West Africa to use the technology for systematic birth registration is the office's own, and no deployment count or registration figure is published for the mechanism. It is the only stated link between birth registration and the identity register anywhere on this ledger; nothing states whether the child receives an identification number at that point or later.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Djibouti	Civil-registry archive digitisation is under way with no completion date; the link to the identity register is not evidenced. The law provides the link in principle - the register of natural persons is the source for every secure document and the land register may cross-check identity documents against the national population database. In practice a regional survey finds no central civil-registration database and fully paper-based exchange between registration levels and institutions. The one movement is preparatory: archive digitisation at the population directorate is under way, with no completion date published. No interface between civil registration and the identity register appears in the record.	NO CHANGE
DR Congo	A consultancy tendered in April 2026 will assess civil registration digitalisation and design integration with health and education data. Nothing links a birth registration to the identity platform. 2026-04-25 - a United Nations tender for a national consultant frames civil registration and vital statistics systems as foundational digital public infrastructure for legal identity, and scopes a rapid assessment of the country's current digitalisation status, design of digital tools including mobile registration and integration with health and education data, and engagement with the interior ministry and civil-status authorities. It is a consultancy at tender. The identity platform it would connect to launched in June 2026 with no enrolment figure published, and the population file beside it is digitalising the capital's register from November 2025, with communal agents being trained on digitalised enumeration by August 2026. At the registration end the position is worse than partial: one rural eastern sector went several months without birth registers and stopped newborn registration outright. A link cannot be built to a registration that does not happen.	MOVEMENT
Egypt	The health cooperation strategy records interoperability with the national identification systems; no birth-registration link is stated. The one interoperability with the identification systems the repository holds is on the health side: the health cooperation strategy records it. On the civil registration side, the electronic birth and death registration system recorded as under way from 2017 and the country's own 2017-to-2026 presentation describe the registration system without stating a link to the identity system. The new biometric platform is a verification service rather than a registration one: unified national biometric verification and instant authentication.	NO CHANGE a first stated position with no earlier account behind it
Equatorial Guinea	Registration feeds statistics rather than credentials: vital events reports draw on hospital and community data with no link to the identity document. The first vital events report describes hospital and community data feeding a statistical pipeline. That is the route the birth record takes, and it ends at the statistics institute. No link from the register to the identity document or the passport is described anywhere in the repository, and the registry law reform that might create one was still under interministerial review in November 2025.	NO CHANGE
Eritrea	Birth registration feeds the regional population registers, and a national identity card is required before a passport is issued (guidance). Operational country guidance published in March 2026 states that Eritrea issues national identity cards and that a national identity document is required before an Eritrean passport can be issued (guidance). Birth registration feeds the zoba population registers through the local family register and transfer documents, and the identity and residence cards are printed extracts of those registers (technical description). The chain therefore exists but is regional rather than national, and the repository holds no birth-registration coverage rate, so how many children enter it is not known. What feeds them is not measured: the 2025 vital statistics return leaves birth and death registration completeness blank, and the only structural account, from 2002, records registration under a transitional civil code in eight urban areas only, optional rather than obligatory, kept for administrative purposes with no statistical data retained. An identity layer fed by a registration system of unknown coverage inherits that unknown.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eswatini	A unique identification number issued at birth appears on both the registration record and the certificate, linking civil registration to the population register. A seven-country regional scoping study confirms that a unique identification number is issued at birth and carried on both the birth-registration record and the birth certificate (study). The annual vital statistics report is the repository's clearest primary description of how that number assignment links registration to the national population register (report). The draft data governance policy names birth-certificate services among the intended uses of the proposed national exchange platform (proposal). The same study finds registrars in some of the seven countries making a citizenship determination at the point of birth registration, which is a linkage that decides status rather than merely records it.	MOVEMENT
Gabon	Separation is by design: the three foundational systems' databases are to be technically, logically and architecturally separate because their purposes and eligible populations differ. The project document states the intended relationship and its deliberate limits: an inclusive population registry managing the personal identification number, a digitalised civil registration system for vital records including birth records, and an upgraded national identity card system, with the databases underlying the three to be technically, logically and architecturally separate because their purposes and eligible populations differ and to protect personal data, while sharing common underlying infrastructure. Separation by design is the finding. Interoperability between birth registration and digital identity is an architectural choice to be engineered rather than a neglected default, and nothing in the repository states that the engineering has been done. What sits at either end is IBOGA, listed among the existing systems the planned common biometric reference is to interconnect, and two draft laws named for the identity system — one on the personal identification number and one on the national civil registry centre, neither adopted, promulgated or gazetted.	NO CHANGE a standing position the repository holds for the first time
Gambia	Designed in 2023, the civil-register-to-identity link is still not counted as working. The health project paper of June 2023 details interoperability between electronic civil registration and the national identity system, alongside a mass registration drive covering 1.17m people. Three years on the interoperability indicator across the social, education, civil registration and health insurance registers stands at zero with one link under verification, and a Civil Registration Bill 2026 cleared first reading on 5 March 2026 with a second reading set for 12 March.	STALLED
Ghana	The number-at-birth system joins the health tracker, the registry and the identity authority, and a credential wallet is proposed to carry certificates digitally. The working join is the number-at-birth system, which integrates the health service tracker, the births and deaths registry and the identification authority so a newborn receives a personal identification number linked to the mother's identity and to a birth-registration number the registry generates; it was suspended on a technical fault and tested again in August 2026. 2026-06-25 - the technology agency held an early market engagement on a proposed secure, interoperable digital-credential layer using public key infrastructure, intended eventually to let birth certificates and other credentials be issued, shared and verified digitally. It is a proposal, not an implemented interoperability.	MOVEMENT
Guinea	Digital civil-status solutions were deployed in 28 communes in 2025 with mobile registration hearings in 375, and the archive digitisation workshop cycle closed at Kindia in July 2026. 2026-03-29 - the territorial administration minister's budget address is the first quantified official account of the 2025 rollout: digitisation of civil status through the identity office, establishment of the national persons register and the national civil status register, deployment of digital solutions in 28 communes, mobile registration hearings in 375 communes and a biometric census at national scale, alongside a biometric electoral file, 21,732 electoral agents trained and electoral cartography deployed. Self-reported and unaudited, with no coverage or completeness rate for birth registration given. 2026-07-18 - a regional workshop cycle closed coupling dissemination of the two 2023 laws with continued digitisation and indexing of civil-status archives, installing digitisation centres, training agents and putting monitoring and quality control in place. No volume of records digitised, and no number of centres, is given. The legal link is already made: the personal identification number is assigned on issue of the birth record, and the persons register is fed by the civil status register. Against that, 72 per cent of births are registered.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea-Bissau	Registration reaches new service points but no link from the register to the identity card is described. The register is being pushed outward — to school enrolment, to health services and to mobile caravans — and the repository describes no connection between it and the identity card production network. The first fully digital registry office opened in the window, at Santa Luzia, which is a digitisation of the office rather than a link to another system.	NO CHANGE
Kenya	Civil registration and the identity system were presented as integrated at a regional registrars-general meeting in July 2026. Amendment rules under the Births and Deaths Registration Act were made in October 2024 (rules). Kenya presented its civil registration and national identity integration to the annual regional expert group meeting for registrars-general in July 2026, under a session on interoperability (presentation). Administration officers were trained on the revised registration system in June 2026 (training). The presentation is the only account of the integration held, and it states no volume, coverage rate or date from which the link has operated.	MOVEMENT
Lesotho	The registry runs an integrated civil registration and identity architecture, now under a modernisation framework. 2022-05 — an assessment documents the integrated civil registration and national identity architecture and the interoperability gaps left in it. 2026-02-26 — the 2026 work plan frames civil registration and digital identity development together. 2026-06-29 — a stakeholder consultation opened on a systems architecture and modernisation framework covering both. The architecture is integrated on paper and the gaps named in 2022 have not been reported closed.	MOVEMENT
Liberia	A point-of-birth pilot links birth certificate, identity number and immunisation record; integration remains a stated priority. The identification session at Digital Liberia Week in October 2025 carried the results of a UNICEF-supported pilot integrating birth registration with the national identity system, with the registry's executive director and UNICEF's chief of child protection setting out a point-of-birth workflow linking birth certificate, national identity number and immunisation record. In July 2026 the health ministry named interoperability with the identity registry among its civil-registration priorities for 2026-2036. Those are objectives rather than achieved conditions, and no national link is recorded as live. The identification registry plans one NID-CRVS system linking national identity with civil registration and vital statistics under the proposed US$54m partnership, signed but awaiting parliamentary approval. Nothing of it is built.	MOVEMENT
Libya	The civil registry database is still under development and the linkage service names no civil registry connection. The information authority's electronic linkage service connects national bodies to the central database and names no civil registry link among them. The registry's own electronic database is still being built: the attorney general reviewed progress on it in March 2026 amid a forgery investigation, and the government reviewed the wider project again in July without a completion date.	NO CHANGE
Madagascar	A law of 28 May 2026 lets births be registered en masse inside the biometric enrolment operation, against a de-duplicated database. Late birth registration had been available only through a costly judicial process; the new law permits mass registration within enrolment, with over 2,000 teams and more than 19,000 local chiefs confirming identities against a de-duplicated database (law). About six million adults, roughly 40 per cent, lacked a birth certificate (identity), so the interoperability here is not a technical link between two working registers but the use of one operation to populate both at once.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Malawi	970,400 birth records were synchronised into the central register and one app now covers four vital events. The design is stated in the bureau's own plan: civil registration kits synchronising with the central register, and an integration layer exchanging data between the civil registration and identity management subsystems. 2026-01 - the integrated registration application was fully tested for national identity, birth, death and marriage registration with online and offline biometric verification, and moved toward phased deployment. 2026-02 - the first phase of the birth registration campaign synchronised 970,400 of 1.1 million targeted child records into the central register, which is the exchange working on nearly a million records rather than in specification.	MOVEMENT
Mali	A 2025 ordinance created the identification agency and the national population register together, and community birth registration reaches remote areas. The institutional link was made by ordinance. The 2025 instrument created the national agency for the security of identity documents and civil status together with the national population register, putting registration and identity under one body — the structural precondition this indicator asks about. Capture is being pushed outward at the same time: community birth registration in remote areas, marked at the ninth African civil status day in August 2026, and perinatal death and birth notification by community health workers. What no source states is whether a registration produces the national identification number automatically.	MOVEMENT
Mauritania	The interior directorate reports biometric interconnection with civil status, and the regulator has taken up register interconnection. This is the one link the repository can show being built rather than promised. The interior directorate's first-half 2026 report describes biometric interconnection with the civil-status system, on a population register that stood at 5.1 million in June 2026 and runs through 153 reception centres. The legal enabling step was the February 2025 amendment providing for digital civil-status acts. The data-protection authority has taken interconnection between the population register and other registers into its monthly meetings, which is oversight arriving with the connection rather than after it.	MOVEMENT
Mauritius	The verifiable-credential wallet is the route by which civil-status records could reach the identity layer; nothing yet flows. Birth registration runs under the Civil Status Act in its 2023-revised form (Act). A clarification of October 2025 set the shape of the secure identity wallet the superapp is built on (clarification). Registry and identity systems are carried together in the public sector investment programme for 2026-2027 to 2030-2031 (programme). No integration between birth registration and the identity system is recorded as operating.	MOVEMENT
Morocco	The birth-linked identifier created by law 36.21 is the join between registration and the identity credential. The law assigns its identifier at birth, which makes the civil register rather than the identity card the root of Moroccan identity. The systems on top are being connected in the same period — the electronic identity card and the national digital wallet tied to it, launched with the protection commission and the security directorate in February 2026 — and the repository does not yet record a live link between the register and either.	MOVEMENT
Mozambique	Hospital births notify the civil register electronically in nineteen facilities of one province, against a civil registration system the Code integrates with the identity system. Real-time digital birth registration launched on 22 July 2024, connecting the hospital birth module to the electronic civil registration system; the pilot expanded from five to nineteen health facilities in Inhambane province and registered over 11,589 newborns, with health workers entering birth data directly and receiving instant confirmation (integration). The civil registration system is itself established by the revised Civil Registration Code as integrated with the national identity and health systems (code). Coverage is one province of eleven, nationwide expansion carries no date, and no figure later than 2024 is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Namibia	Birth, identity, marriage and death modules were staged into one person profile against the unique identity number between 2012 and 2014. The case study traces the staged integration of the birth, identity, marriage and death modules into a single person profile in the population registration system, keyed to the unique identity number assigned at birth notification (case study). Electronic notification reached 126 facilities by December 2025 and 153 by March 2026, which is the pipe that carries a birth into that profile (facilities). The electronic identity card launching in September 2026 is the credential that would sit on top of it (launch). Namibia's birth-to-identity chain is the most complete on this repository among its neighbours, and the thing it has never had is a data protection statute governing what flows along it. 2026-10-08 - a trade publication reported the electronic identity card's September rollout delayed because the legal framework had not been finalised, as two ministries briefed Parliament.	MOVEMENT
Niger	The identification project was relaunched in September 2025 and the May 2026 decree ties the civil register to the population register under one identifier. This is the indicator the window's reform was aimed at. The government launched the identification project's restructuring mission on 22 September 2025, led by the economy and interior ministries with a financier's delegation, reorienting it to give every citizen a government-recognised identity that eases access to services. A February 2026 mission then aligned the population register with the civil-status system. The legal step followed: the May 2026 decree provides interoperability mechanisms between the civil and population registers and a national unique identifier for every resident. Capture at birth is being piloted separately, through biometric birth-certificate work at Filingué.	MOVEMENT
Nigeria	Registration went nationwide on a digital platform from 1 July 2026, on a commission that states its system is interoperable with the identity commission. The platform is live across all 36 states and the federal capital territory from 1 July 2026, and the Gombe pilot was explicit about the link: personnel from 114 health facilities and 114 wards were trained to capture births electronically and integrate registration with identity enrolment. The commission's own statement puts the electronic civil registration system as interoperable with the identity commission and other identity agencies, and the 2026 identity Act strengthened the legal basis. No volume of records exchanged between the two is published.	MOVEMENT
Rwanda	The 2023 law requires synchronisation between the identity system and civil registration, and an integrated civil registration system launched in June 2026. The statutory requirement is explicit: the single digital identity system must be synchronised with civil registration and vital statistics (law). The system launched in June 2026 is interoperable with the national population registry, the health management information system and the government services platform, with registration authority decentralised to cell level (launch). All nine modules of the digital civil registration system were reported complete in January 2026, ahead of the government's own schedule (announcement).	MOVEMENT
Sao Tome and Principe	The civil registry is being built out as the technical basis for the electoral register, with equipment handed over in September 2025 reinforcing the security of the registry systems. The country diagnostic records that the registries directorate began digitising the civil registry and civil identification systems in 2017 and implemented the life-events system in 2018, enabling digital registration of life events across the country (diagnostic). A public session in September 2025 presented an automatic voter registration platform under development by a Portuguese university, handed over equipment reinforcing the technological component and the security of the civil registry systems, and awarded training certificates to registry and electoral commission technicians (session). The source does not itself name the life-events system or the identity card as the platform's data sources, and no such linkage is asserted here beyond what it states. The registry is being readied for one consuming system; the identity credential is a separate build (mission).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Senegal	Birth registration coverage rests on two instruments on different bases, and an audit of civil registration in 74 communes covering 2018 to 2025 was launched in July 2026. The coverage figures come from two instruments on different bases — a census stock figure and a survey coverage rate — which is why they cannot be read as one series (coverage). The audit mission was launched at Rufisque on 28 July 2026 covering 2018 to 2025. It tests the reliability of the paper base the digital register is built on, and no findings or reporting date are stated (audit). An audit of that scope, opened while the register is being loaded, is the right sequence and the one the record most often shows reversed elsewhere in this unit.	MIXED birth registration coverage advancing while an audit tests the reliability of the paper base the digital register is built on
Seychelles	Digital identity is issued through the immigration department's own digitalisation programme built with DICT, tied to the identity number and permit validity. The department told the National Assembly's budget sitting in November 2024 that digital identity, linked to the National Identity Number and to permit validity, is issued through its own digitalisation programme built jointly with the ICT department (verbatim). Civil registration sits in the same department, whose Division holds the population database (division), and the 2021 amendment obliges it to digitise every disused register (amendment). Birth registration and digital identity therefore share a custodian rather than an interface, and nothing held describes a data flow between them.	NO CHANGE
Sierra Leone	The National Civil Registration Act 2016 puts civil registration and identity in one authority, and a health record is to become a valid registration document. The 2016 Act establishes the authority as an independent body with its own board and a confidentiality duty, holding both the civil register and the identity function (Act). The authority marked the sixth Africa CRVS Day in August 2023 on the integration of civil registration with identity (integration), and announced in March 2026 that the maternal and child health handbook will be recognised for birth registration (handbook). Institutional integration is not technical integration. No figure is held for births registered and identity numbers issued from the same event.	MOVEMENT
Somalia	The statutory basis arrived with Law 46 in April 2026; the link itself is still a planned platform, not an operating one. The 2021 country profile found the intended link between birth registration and legal identity still at policy-design stage rather than operational (profile), and nothing since states it working. The deputy prime minister announced in February 2026 a centralised platform through which citizens would obtain birth and marriage certificates through one interface, with implementation to begin the following year (announcement). A coordination meeting on modernisation and service expansion was held in February (meeting), and the identity conference agreed a technical working group in November 2025 (conference).	MOVEMENT
South Africa	Cabinet approved a white paper anchoring digital identity in an intelligent population register with real-time integration and digitally enabled mandatory birth and death registration. 2026-04-08 — Cabinet approved the Revised White Paper on Citizenship, Immigration and Refugee Protection, anchoring civil-registration reform in turning the National Population Register into an Intelligent Population Register through biometrics, interoperability and real-time integration as the foundation for digital identity, alongside digitally enabled mandatory birth and death registration. It is a white paper rather than a bill, and the identification statute it anticipates is carried separately on this ledger. What it states plainly is the design: registration at birth and the digital credential are to be one system rather than two, which is the position this indicator asks about and which no instrument has yet delivered. No timetable, cost or architecture is published with it.	MOVEMENT
South Sudan	The two sit in one directorate and are not yet linked; a plan to connect them was announced in July 2026. The Directorate of Civil Registry, Nationality, Passport and Immigration holds both functions and announced plans to digitise civil registration and link it to the identity system, coordinating three ministries (plans). The statutory basis for the identity side is the Nationality Act 2011, which requires the directorate to maintain a register of nationals (Act). Institutional unity has not produced technical connection. No figure is held for births registered and identity records created from one event.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sudan	The same joint committee is the only mechanism on the repository, and it is a governance step rather than a working link. The March 2026 agreement is explicitly to restore and develop electronic linkage between the health and civil-registry systems, with technical subcommittees and a memorandum to follow; the health side disclosed twelve digital-transformation projects under way (agreement). The hospital management system's first phase integrates civil registration and vital statistics alongside patient records and disease surveillance at two hospitals (launch). No source states that a birth registered in a health facility creates or updates a civil-registry record automatically. The committee exists to build that, which is the evidence it does not yet exist.	MOVEMENT
Tanzania	A 2021 amendment requires an electronic birth register and authorises sharing with identity bodies; a Child Registration Act is drafted. The 2021 omnibus amendment adds section 19A to the Births and Deaths Registration Act, requiring an electronic register and authorising the sharing and exchange of registration information with institutions mandated to identify and register persons — the enacting instrument for civil registration to digital identity interoperability. The registration agency operationalised 48-hour birth certificate issuance, framed by its chief executive as the gateway to national identity, passports, health insurance and education services. The identity authority's director general announced a forthcoming draft Child Registration Act extending national enrolment to registration from birth; it was scheduled for the January 2026 session and no enactment is on file. No figure for identifiers issued at birth is held.	MOVEMENT
Togo	Birth registration is being wired to education and to maternity units, and not to the identity register. Togo's own account to the continental experts' meeting on 18 July 2026 claims more than 125,356 identities assigned to pupils since 2024 and an 18 per cent rise in the share of children holding an identity and sitting examinations, with an annual dashboard tracking undocumented children in schools — alongside insufficient coordination, very expensive late issuance and a legal framework needing updating. An application deployed across four communes of Vo prefecture since February 2026 lets maternity data reach the town hall once the facility head validates it, against a threshold of 90 per cent of children documented within eight days of birth. The agency's own standing statement is that the identity file is not linked to the civil registry.	MOVEMENT
Tunisia	The citizen identifier is assigned off the civil-status birth register, and birth certificates now issue remotely. The 2020 decree-law assigns the citizen unique identifier to every Tunisian registered in the civil-status birth register, including births registered abroad through diplomatic and consular missions, which is the link between birth registration and the identifier by construction. Birth certificates are now issued remotely through the national services platform, with a remote translation service alongside. What is not held is whether the link works in practice: no figure for identifiers assigned at birth, no lag between registration and assignment, and no statement of what happens to a person registered before 2020.	NO CHANGE
Uganda	The identity platform carries a birth and death registration module issuing a number automatically on birth notification, with a working group adopting process maps and data sharing. 2026-07 - the registration authority's own account of the architecture describes the secure identification system carrying a birth and death registration module, with an identification number issued automatically on birth notification and certification following immediately. 2026-04 - the technical working group on civil registration and vital statistics adopted a health-facility death process map and data-sharing arrangements with the statistics bureau. 2025-09 - in practice this ran through hospitals: registration teams issued births and numbers on the spot at referral hospitals during the mass enrolment exercise. The architecture is presented rather than evaluated. No share of births actually notified electronically, no time-to-certificate figure and no reconciliation between the civil register and the identity register appear in the repository.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zambia	A system integrator was invited to deploy and integrate foundational identity and civil registration modules, over a regulation deriving the card number from the birth record. Regulation 6(2)(a) of the National Registration Regulations, 2019 is the clearest legal linkage: for a person born in Zambia the national registration card number is derived from that person's birth-registration record. The link exists in law. 2025-09 — the acceleration project invited vendors for a system integrator to deploy, customise and integrate foundational digital identity and civil registration core modules, including data migration and enrolment kits — the procurement that would make the legal link technical. 2026-04 — the country's civil registration experience informed validation of a continental interoperability framework's non-functional requirements; it is not among the six pilot countries.	MOVEMENT
Zimbabwe	A secure exchange platform for birth and death notifications is in build, with automated validation against the national population register and a pilot set for 2027. The registrar-general's ICT deputy told the regional registrars' meeting on 18 July 2026 that Zimbabwe is still in the implementation phase, with a secure interoperability platform being built to exchange birth and death notifications between health facilities and the civil registry (presentation). The same account names automated validation and synchronisation against the national population register as the mechanism for minimising duplicate records, and sets a roadmap of a business intelligence module in the third quarter of 2026, middleware design in the fourth, training through 2026 and 2027, and a three-province pilot in the first half of 2027 (roadmap). Registry modernisation itself remains under way with no completion date and no coverage figure. Nothing interoperable is yet in service: what the repository holds is a design, a roadmap and an acknowledged gap.	MOVEMENT

Use by other systems

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	Remote biometric passport renewal opened to the diaspora on 24 June 2026 at the Paris consulate general first. The service did not exist at the window's opening. 2026-06-24 - remote renewal opened at the Paris consulate general, to be extended to other consular posts. No application count, processing time or issuance figure has been published since. It is the clearest use of the identity layer by a service that is not itself an identity service, and it reaches a population outside the country - which makes the absence of any stated data-transfer basis, in a state with mandatory in-country localisation, the open question the record does not address.	MOVEMENT
Angola	A bill would make the identity card the only valid document for banking, telecoms, school enrolment and contracts, and a law makes it the sole electoral credential from 2027. 2026-04-29 — the Council of Ministers approved a bill making the identity card the only valid document for banking, telecommunications, school enrolment, property registration and contracts, replacing an arrangement in which voter cards, driving licences and passports are accepted substitutes. No parliamentary stage has followed. Separately, an official electoral registration law replaces in-person enrolment with automatic enrolment drawn from the civil identity database, with the voter card used for the last time in 2027 and the identity card becoming the sole registration credential thereafter. No gazette reference is on file and the law reaches the repository through a secondary account. Both make the card load-bearing for services it does not yet reach: 52.4% of the population aged five and over holds one. Nothing on the ledger records an authentication service, an interface or a verification volume behind either instrument.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	Identity is required for SIM registration and now carries diaspora passport renewal in more than 80 countries. 2025-04-30 — the regulator ordered unregistered SIM cards deactivated, an anti-fraud measure that reporting itself noted demands a strong data-protection frame. The position is unchanged since. 2025-10-24 — a diaspora biometric passport renewal platform went live, available in more than 80 countries with renewals reported at about 15 minutes, built by an external vendor on the national exchange and tied to national identity and immigration systems. The register's reach is the country's distinguishing feature and is measured under the population register below. What is missing across both cases is any published rule on which body may query identity for what purpose: the access conventions reported under data exchange are the nearest thing, and they govern connection rather than use. 2026-10-03 - the finance ministry let pensioners prove they are alive from a smartphone, identified by personal identification number and checked by fingerprint.	MOVEMENT
Botswana	Identity-linked SIM registration has been mandatory for all users since March 2024, with no later regulator statement or registration rate held. Registration has been mandatory for all users since a public notice of March 2024. Nothing has moved it: no later regulator statement, registration rate or de-registration figure is held. It is the only case on this ledger of the national identity being required by another system, and it is the oldest instrument in this section. Nothing states what identity document satisfies it, which matters against the card replacement failures reported above, or how it is verified without the certificate layer the country does not have. 2023 — the Omang became usable as a travel document between Botswana and Namibia, and a German supplier was contracted in May 2023 to build a shared platform for automated card checks at the Mamuno-Trans-Kalahari crossing. Whether the automated checks are live is not stated. 2024 — the Gaborone City Council linked a city-wide facial-recognition CCTV network to the Omang database for real-time public-security surveillance, a use outside the registration statute's founding purpose.	NO CHANGE
Burkina Faso	Two systems consume it: subscriber-card activation requires prior identification of the subscriber, and the universal health insurance scheme began issuing about 3,000 cards a day from 1 February 2026. 2026-02-01 - the universal health insurance scheme began paying benefits, requiring beneficiary registration and card issuance at a stated rate of about 3,000 cards a day at the managing fund, starting with civil servants in two regions before a phased national rollout. No cumulative enrolment figure is published. The telecommunications case runs on a decree of 31 December 2018 making identification of the subscriber a mandatory precondition for activating a subscriber card. The general position is broader than either: possession of the national identity card is a requirement for most aspects of economic life, which makes issuance coverage an exclusion measure and not only an administrative one. What is missing is any statement of how a system checks the card — no verification service, interface or volume is published. 2026-09-16 — the next use named for the identity chain is academic: the security minister made the securing of diplomas the theme of the seventh International Identity Day, setting the aim as a centralised national interoperability and trust framework that leaves academic prerogatives with the institutions while making the production and verification chain tamper-proof. No instrument, operator or timetable is published.	MOVEMENT
Burundi	There is no central national identity database able to support digital know-your-customer; identity is consumed as a document, not as a query. A payment-infrastructure assessment records that the national identity system is non-biometric and that there is no central national identity database able to support digital know-your-customer, national identity cards being presented as documentary evidence at account opening rather than authenticated against a register. It distinguishes identity interoperability from the payment switch, which does exist. That is the position the whole of this chapter rests on. Every system that requires identity in the window — the financial sector's customer identification rules, compulsory SIM registration, social protection enrolment — verifies a piece of paper, because there is nothing to ask.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Cameroon	Compulsory taxi and driver registration opened at Yaounde with a QR code per driver, and a student digital identity was provided for. 2026-07-03 to 2026-10-05 - compulsory registration on a city platform opened, with a QR code and a unique door number per driver, unregistered taxis barred after the deadline. It is a city council order with development-agency support. 2026-06 - a memorandum addendum provided for a secondary-school student digital identity card linked to academic, financial and disciplinary records and to school-fee payment, replacing a unique student identification number assigned through a ministry portal since 2024; no issuance is reported and no signature date is published. Neither is stated to draw on the national register, so both are sectoral credentials rather than uses of the foundational identity.	MOVEMENT
Central African Republic	The unique identification number is recorded as mandatory; no consuming system is named. A development bank's completion report for a general budget-support operation records the unique identification number as made mandatory - the clearest statement the repository holds that one identifier is required across other systems. No instrument imposing it is named, no coverage figure is given and no system is stated to consume it. The one system that assigns an identifier on the record is clinical rather than national: an electronic medical record deployed with the health ministry assigns each patient a unique identification on registration, which is its own numbering, not the national one.	NO CHANGE a first stated position with no earlier account behind it
Chad	A mass enrolment and subscriber-data partnership was signed with a mobile operator, wiring subscriber data into the identity register. The partnership was signed in May 2026 (partnership). It wires subscriber data into the identity register with no data-protection authority on file overseeing it. No enrolment target, retention rule, consent mechanism or regulator role is stated. Together with the finance ministry's real-time feed, that gives the register two live interconnections and no supervision.	MOVEMENT
Comoros	A digital identity layer is asserted as a workload of the public-administration data centre, with no architecture or timetable. The layer is asserted by the agency that would run it, the data centre stated to support the national domain name system, digital identity and service portals, with no architecture, standard, supplier, timetable or coverage target, and no counterpart line at any grain in the 2025 or 2026 vote. It reaches the repository through a rolling agency page dated by proxy. A biometric driving-licence programme, named in the 2025 budget bill, is still named in no finance law at any grain, with no instrument, tender, supplier or issuance date on record, and the 2026 classification carries no line for it, nor for a national identity card, biometric enrolment, passport system or voter register.	NO CHANGE
Congo	The unique identification number is mandatory for eight economic transactions and five administrative or social formalities. The number is now mandatory for eight economic and five administrative or social formalities, among them bank accounts, transfers abroad and telecom subscriptions. That is a substantial dependency built on a credential whose coverage is unpublished: no national issuance figure exists, and the repository records cards going uncollected in the thousands in a single city. Nothing states what a person without the number does when a formality requires it, or whether any alternative route remains open.	MOVEMENT
Cote d'Ivoire	A postal application carrying identity-card, birth-certificate and criminal-record applications was launched in January 2026. 2026-01 - a register-backed application for mail and parcel management, identity-card, birth-certificate and criminal-record applications was launched, with card delivery through more than 200 post offices. No download, registration or transaction figure has been published since launch, so what the route carries is unknown. The postal operator is the second commercial-scale consumer of the register in the window, after the bank authentication service, and neither has a published legal basis for the query.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Djibouti	The mobile identity system gives partner administrations access only to authentication services, without direct access to the databases. Nothing of the kind existed when the period opened. 2026-02-10 - the mobile identity system was launched with biometric authentication, partner administrations reaching only the authentication services rather than the databases directly, positioned as complementary to the identification number and civil-registry modernisation. Closing the forum that launched it, the President set out identity theft, cloning, hacking, espionage and over-centralisation as the risks alongside the benefits. No relying party is named, no service is on record as connected, and no authentication volume is published - the architecture is stated by its owner and not evidenced in use.	MOVEMENT
DR Congo	The biometric passport stands at US$75, 2,400 a day across 100 stations, with no later figure held. The passport price was cut to US$75 with a new supplier and online enrolment, on 50 fixed and mobile stations plus 50 at missions and a stated 2,400 a day, against prior prices of US$185 then US$99, under a 2022 contract worth US$48m. No later price, volume or station figure is held, so the position is unchanged through the window. Nothing states whether the passport draws on, or will draw on, the identity platform launched in June 2026, which is the question the indicator asks and which no held source addresses.	NO CHANGE
Egypt	The central bank approved rules for a digital financial identity, and the Prosecution opened criminal-record self-enquiry through digital identity. 2026-08-23 - the central bank's board approved rules for the digital financial identity system: customers may open accounts and take banking products through digital channels without visiting a branch, with electronic acceptance of terms and electronic authentication in place of a handwritten signature, the rules setting out governance, participants' roles, technical and operational requirements and data-protection and cybersecurity controls, the system having been launched in November 2025. No enrolment or verification volume is held. On the non-bank side, lending, investment and insurance companies may create digital identities, run biometric and non-biometric checks against national-identity and mobile-registry databases and execute binding electronic contracts, the licensee reporting over 25m verifications a year. 2026-07-27 - a citizen may now query criminal judgments registered against their own national number through the digital identity system, the Prosecution stating the result is not a substitute for official certificates. The incumbent operator launched electronic identity verification with e-signature for buying and activating mobile lines without paper documents, without naming the identity database it checks against.	MOVEMENT
Equatorial Guinea	One documented use: a wallet accepting a SIM and an identity document copy at fuel stations. The identity document appears once in the repository as an input to another system, at onboarding for a mobile wallet at fuel stations. Everything else that would consume it runs on its own enrolment: the business single window on a company file, the tax identification number under a draft recoding decree, and social benefits on the insurance institute's own roll.	NO CHANGE
Eritrea	Banks carry a customer identification duty, and the card is required before a passport is issued; no electronic check is recorded. The clearest standing example of the national credential being used by a system other than the one that issues it is the anti-money-laundering proclamation, which requires financial institutions to set customer identification policies for business relationships and large cash transactions. Beyond that, a national identity card is a precondition of passport issue and of a fixed telephone line, and there is no online public service portal that could ask for it.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eswatini	The e-KYC registry is being built so banks and ministries can verify against one identity record, with 500,000 users targeted by 2028. The central bank convened banks, financial-service providers and government ministries around a national identity-verification registry, with a cross-border dimension inside the regional bloc (registry). The FinTech Strategy 2025-2030 commits to it, targeting 500,000 users and 80 per cent interoperability by 2028 (strategy). Technical assistance is funded to connect the national system into a federated regional framework. Against the commitments, the credential itself does not qualify: the national identity card does not meet the criteria for digital identification, and no verification volume is published for any system. 2026-09 - an Immigration Bill would let a vetting system's automated notice bar a foreigner's entry, at about E6 million. 2026-09-15 — identity is the gap the revenue service names: it says businessmen change the order or variation of their names to evade detection, and digital identification would establish that different names belong to the same person.	MOVEMENT
Ethiopia	Bank accounts must be linked to the identity, with a 9 November 2026 deadline outside the cities already enforced, and one bank opens accounts on it alone. The December 2025 directive required every bank account to be harmonised with the national identity by 30 March 2026 (banking integration). A commercial bank opened the first accounts on the identity alone in April 2026, without other documents (remote account opening). 2026-09-16 — the largest state bank has placed unlinked accounts in 26 cities and the Harari Region under debit restrictions, and gave customers everywhere else until 9 November 2026 to link theirs. No share of accounts linked is published.	MOVEMENT
Gabon	The electoral code identifies each elector from the personal identification number, the roll drawn and updated from the national biometric file, and the ministry publishes an online lookup on that number. The code is the clearest operative instance in law of the identity register being used by a system other than itself: it institutes a single national biometric electoral file, places establishment of the roll with the interior ministry, provides that for all political elections and referendums each elector is identified from the personal identification number with the roll drawn and updated from the national biometric file, enrols automatically any citizen holding a number, and prescribes documentary alternatives. 2025-09 - it is in service rather than stated: the ministry publishes an online service through which a citizen checks their entry on the roll and their polling centre by entering the number with their name. A second consumer is being built: the single payroll declaration makes the number obligatory for employees across three administrations. No count of lookups, verifications or numbers issued is published for either.	MOVEMENT
Gambia	No system is recorded consuming the identity credential issued in June 2026; the register links stand at zero. The credential is new — first issued in June 2026 — so its absence from other systems is expected rather than a failure. What makes it material is that the connections were designed years earlier and have not been made: the health project paper specified the civil-register link in 2023, and the count of working register-to-register links remains zero as at November 2025.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	The card has been the sole identification for transactions at regulated financial institutions since 1 July 2022, is an optional travel document within the sub-region, and carries no payment function. The banking requirement is older than the repository carried. The central bank directed, under regulation 7 of the National Identity Register Regulations 2012, that from 1 July 2022 the card be the only identification accepted for transactions at all institutions it licenses and regulates. The January 2026 guidance added biometric and liveness checks to a position already in force, and rests on a supervisory guidance note of June 2022 directing accountable institutions on use of the card, held here in full. The immigration service has admitted returning citizens and dual nationals on the card since 1 March 2022, following its recognition as compliant with the international civil aviation standard, verified against the identity register at designated airport booths. It cannot be used to leave the sub-region until bilateral agreements are signed, so the credential is accepted at the border it was issued behind and nowhere else. 2026-09-17 — the identification authority said the Ghana Card will become an electronic wallet secured by biometrics and PIN, linked to bank accounts and loadable through vendors. No date or central-bank approval is stated. 2026-10-05 - a public campaign pressed for the regional biometric card's acceptance at every member state's borders by December 2026.	MOVEMENT
Guinea	A biometric civil-service payroll audit confirmed about 130,000 of about 277,000 registered staff and reports 233bn GNF saved since 2024. The system has been in use since 2024 with no audit result published before this one (audit). The saving is about US$26.9m at the reported date and is the government's own claim (audit); no methodology, payroll series or independent verification is held, and the audit confirmed under half of those registered.	MOVEMENT
Guinea-Bissau	The regional card was used for cross-border trade by more than 260 women; no domestic system consumes the identity. The one recorded downstream use is regional rather than domestic: more than 260 women traders received regional biometric cards at the Senegalese border in a pilot handover. Inside the country the registers run on their own identifiers — the tax identification number issued solely through the payment platform and the electoral roll — and none is recorded checking against the identity register.	MOVEMENT
Kenya	The High Court barred discontinuation of physical vehicle logbooks pending a petition on public participation and data-protection assessments. The electronic system stands but cannot replace the paper one while the order holds; the petition argues it was introduced without public participation and without adequate data-protection and cybersecurity impact assessments (order). A compulsory digital seller identifier for electronic commerce was proposed by the trade ministry and is still a proposal with nothing on record being built (proposal). A twenty-one-year partnership approved by Cabinet on 15 December 2025 would issue smart driving licences through a KCB Bank and Pesa Print consortium on KSh 42bn of private debt and equity; no financial close or first issuance date is named.	MIXED an electronic logbook was suspended by court order while a seller identifier remains a proposal
Lesotho	The identity number is in use for customer verification across the financial sector, and cross-sector authentication is being formalised. 2025-11-17 — the financial sector strategy is the most current statement of the identity number's linkage to the credit bureau, banks, insurers and mobile network operators. 2026-02-26 — the 2026 work plan formalises cross-sector authentication and financial-services identity verification. 2025-08-26 — a framework workshop set out identity-verified access to services, the earliest in-window statement of the design. What the repository does not hold is a transaction figure: how often the identity is actually checked, by whom, and at what cost to the relying party.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Liberia	Module registration was tied to the identity number with a July 2025 deadline, and no compliance figure or enforcement action has followed. The deadline was set under an October 2024 memorandum between the telecoms regulator and the identity registry (memorandum). No revised deadline is published either, on a register whose issuance was halted for most of the period the deadline ran, so the requirement and the credential it requires were unavailable at the same time. The civil service uses the register for its payroll: under a memorandum signed in May 2024 the Civil Service Agency verifies government employees through the registry's e-verification portal and carries identity numbers on their work cards, and the registry reported ghost names removed from the payroll by March 2025 without publishing a count.	NO CHANGE
Libya	The National ID Number gates SIM registration, passports, bank accounts, marriage and voting, and that position has not moved since 2024. The number is in force and required across those services, which makes it the country's operative credential rather than one of several (gating). Nothing has been published since 2024 on how many transactions are gated on it, on which further systems have taken it up, or on what a resident without one can still obtain.	NO CHANGE
Madagascar	The unique identifier was integrated into the household register and civil-servant enrolment by December 2025, with gaps outstanding. A World Bank implementation-support mission of December 2025 records integration of the unique identifier and the biometric database into the household register, human-resources enrolment of civil servants and digitisation of a court records system, with integration gaps outstanding before the project's June 2026 closing date (mission). The law on identification of natural persons that underpins the use cleared constitutional review in August 2025 (decision). The mission report names the integrations; it does not state which are in production, and no transaction volume through any of them is held.	MOVEMENT
Malawi	Mandatory biometric SIM registration authenticates against the identity system, and no completion figure, compliance rate or closure date is held. 2025-12-01 - banking took up the identity system first: the Reserve Bank of Malawi announced in 2018 that the national ID would verify new accounts and required existing customers to link their accounts to it. The National Registration Act 2010 names neither banks nor the other institutions that rely on the card, so the banking use rests on the regulator's instruction rather than the identity statute. 2026-09-17 — a first relying party outside government administration: the higher education loans board moved loan-contract bonding onto a paperless process in which students present the national identity card and scan fingerprints against the registration bureau's database. No volume or data-sharing instrument is published. 2026-09-29 - an e-KYC and digital identity project implemented with the central bank was reviewed for its achievements and transition by India's High Commissioner with two UN agencies; no deliverable or transition date is published. 2026-09-29 - the biometric tobacco grower registration broke down at centres in three districts, devices failing to sync and scanners failing on elderly farmers' fingerprints.	NO CHANGE
Mali	The NINA national identity number is in use as the national identity key and authenticates applications to the justice e-services. The number is the identity key on which the online criminal record and nationality certificate applications are made (number). No count of systems keyed on it, no authentication volume and no coverage share of the population holding one is published, so its reach into other systems is recorded by example and not by measure.	NO CHANGE
Mauritania	Formal notices went to all three operators in January 2026 over biometric SIM identification, with a two-month deadline before sanctions of up to 3 per cent of turnover. Deactivation of non-biometric cards had been ordered in October 2023 with compliance not established; formal notices with a two-month deadline followed in January 2026 (notices). No compliance outcome is on record. Three years between an order and a sanction threat, with no published measure of how many cards were affected either time, is the shape of enforcement here.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritius	SIM registration by electronic identity check has been in use since the re-registration exercise, with no completion or coverage figure held. The electronic verification steps were published for the re-registration exercise and remain in use (steps). No completion or coverage figure is held, and no other system is recorded taking the national identity as its authentication, so the identity layer's reach into other sectors cannot be established from this repository. 2026-09-29 - the digital driving licence was soft-launched on the KOREK app, with legal effect from 1 January 2027; access needs a fully activated MauPass account. 2026-10-02 - the ICT minister said a driver without a smartphone may go on showing the physical licence, and put MauPass registrations at 500,000.	NO CHANGE
Morocco	The national digital wallet binds five state bodies on a card-authenticated core, on eight partnership conventions signed in February 2026. Eight conventions were signed in Rabat in February 2026 and two vendors engaged on architecture, on a stated six-month build (conventions, architecture). The bodies bound are the social security fund, the road safety agency, the land registry, transport, and youth and culture. No launch date, service count or user figure is held, so the repository records which systems have agreed to take the identity and not one that has.	MOVEMENT
Mozambique	Biometric SIM registration became compulsory in 2024 with blocking from 2025, and nothing has entered the repository on the regime since. Registration was optional from a pilot in January 2024, compulsory in the second half of that year and subject to blocking from 2025, as described at the time (regime). No later account is held and no registration, blocking or enforcement figures exist in the repository at all. Nothing has entered it on this regime for over two years, which for a compulsory nationwide identity-linked measure is the notable fact.	NO CHANGE
Namibia	The population register is read by social protection for beneficiary verification and by the payment network for the first government grant disbursements. The home affairs ministry's annual report documents the register connected across its own offices and border posts (report). Outside the ministry, social protection verifies identity and live status against it, and uses it to identify and refer undocumented people (integration); the effect showed in June 2026 when 15,825 unverified old-age grants were suspended (suspension). The first live government grant payments ran over the national instant payment network in June 2026 through one certified bank (payment). Two systems read the register today: social protection and, through it, payments. No banking, tax or land system is recorded doing so. 2025-12-01 - mobile operators are a further user outside government: requirements introduced in 2023 under the Communications Act 2009 oblige operators to collect and keep subscriber identity details at SIM registration. No compliance figure or register linkage is stated.	MOVEMENT
Niger	The May 2026 decree creates a national unique identifier for every resident — the key the tax and electoral registers have never shared. Niger's registers each carry their own key. The tax administration issues a fiscal identification number, used in the 2026 property tax census; the electoral file runs on the 2017 electoral code; the land register is building a unique parcel identifier of its own. The reform of May 2026 supplies what none of them share: the decree provides interoperability mechanisms between the civil and population registers and a national unique identifier for every Nigerien and long or short-term foreign resident. Nothing yet reports a second system consuming it, so what moved is the legal precondition rather than a working consumption.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	A learner identification number was integrated with the identity register, farmer verification is planned on a subsidy taper, and pre-registered SIMs ended. Katsina State sought a partnership with the national identity commission, reported 10 October 2026, to integrate its identity management system with the national architecture; the two agreed a technical working group to draft a framework and memorandum within eight weeks. A sixteen-digit learner number issued from April 2026 reached 1.9m at launch and was integrated with the identity register across a stated 80m student records; birth registration is integrated so newly registered children receive a number automatically, yet school admission remains manual and the birth register is not connected to any state education platform, so the failure is interoperability rather than enrolment. It was announced on a social platform rather than in an instrument (learners, gap). A centralised farmers database would target subsidies on a three-year taper (farmers), and on 29 September 2026 the agriculture minister called for a national digital farmers register linked to the identity number, with states enumerating; and a proposed bureau would tie credit scores to the number with consequences for defaulters extending to passport and licence renewal and tenancy (credit). Pre-registered cards ended in November 2025 (cards). A state credential has gone further than the national one.	MOVEMENT
Rwanda	A biometric SIM registration regulation was issued in August 2024 and piloted the following month. The regulation governs registration of subscriber cards and was piloted in September 2024 (regulation, pilot). Nothing on file records completion, coverage or a link to the digital identity register, so whether the two biometric captures are one enrolment or two is not established here.	NO CHANGE
Sao Tome and Principe	The migration service now issues passports non-presentially on a scanned copy of the identity card, whose authenticity it verifies - the first system recorded relying on the national credential. The foreign ministry announced that passports are being issued by non-presential means under the amended passport regime, aimed at citizens in the diaspora and particularly where the State has no diplomatic or consular representation, on a signed application form and a copy of a valid identity card whose authenticity is verified by the migration and borders service (announcement). The verification described is a documentary check on a scanned copy rather than a digital authentication against a register (announcement), which is the distinction the indicator turns on. The registry's own exchange interface names no consuming system in production (interface), so this is reliance on the credential as a document rather than use of the register as a service.	MOVEMENT
Senegal	Two large systems made the identity credential a condition of service in the window: mobile subscriber identification and pension proof of life. The regulator opened the final phase of the national subscriber identification campaign with the five operators and the interior ministry's file-automation directorate: unidentified lines suspended on 31 March 2025, terminated definitively from 29 September and no regularisation accepted after 31 October 2025. Whether verification queries the national file or only inspects the card is not stated. The pension institution opened its periodic proof-of-life collection on 1 July 2026 on a digital platform requiring the national identity card, with assisted routes for those who cannot use it. The technical arrangement behind such use was diagnosed rather than built: a 2019 feasibility study analysed the existing biometric files and what it called the problem of the national identification number, and proposed a register of natural persons coupled to the civil register — recommendations, not a system since built.	MOVEMENT
Seychelles	The credential carries a Digital Driving Licence connected to the licensing authority's own system, beyond its originating identity domain. The wallet names a Virtual ID Card built with Immigration and Civil Status and a Digital Driving Licence built with, and connected to, the licensing authority's system (wallet); the same authority's business and vehicle licence services require the credential to log in (licensing). The social protection platform launched in October 2025 is reached through the same portal (platform). A business-facing gateway is being built: the tender board recorded the Ease of Doing Business Portal awarded at USD 1,295,452.86 in December 2025 (award).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sierra Leone	A national digital farmer registry was agreed for integration with the identity number in May 2025, and an agricultural voice-response platform is reported 98 per cent complete. The registry integration was agreed with the agriculture ministry in May 2025 and has not moved since (registry). The voice-response platform is described as 98 per cent complete, which is the ministry's own description (platform); no launch date, language coverage, call volume or cost is stated (platform). Neither carries a data-protection arrangement, in a country with no data-protection law in force.	NO CHANGE
Somalia	The credential was enforced at the main airport for inter-state travel from March 2026, and a legal analysis holds the proclamation behind it exceeds the Act, which confers a right and imposes no duty. Making a credential compulsory when about 2m of an estimated 19.7m people hold one is an exclusion question before it is a legal one, and no exception, appeal or alternative document route is published. 2026-09-07 - the deputy prime minister asked for the identity number to be required to open a social media account, with no draft rule published. 2026-09-16 — the immigration agency presented its biometric passport, electronic visa and exchange of travel data to the African Union's counterterrorism centre as the basis of border-security cooperation. No issuance figure, coverage or data-sharing instrument is published, and the exchange is described as cooperation rather than as an agreement. 2026-09-19 - the information minister said access to communication services, including SIM cards, will depend on holding the national identity credential; no rule or date is published. 2026-10-01 - the federal government began enforcing the national identity card requirement for domestic travel, and passengers in Puntland, where the authority has no registration offices, were refused boarding. 2026-10-06 - the identity authority moved to link its services to the national unified public service delivery centre; the integration is planned, not implemented.	MIXED the credential made compulsory for inter-state travel while a published legal analysis holds the proclamation exceeds the statute
South Africa	Home affairs built the Treasury a real-time biometric employee-verification portal against the population register, and voter details are checked against the register through an interface with the electoral commission. 2026-05-26 — a real-time biometric employee-verification portal was built for the National Treasury and linked to the population register, to detect payroll records with no matching person, with go-live stated as 15 June 2026. No confirmation that go-live occurred, and no count of records checked or discrepancies found, is on file. It is the clearest case on this ledger of the identity layer being consumed by another department's system rather than by a bank, and it is priced: the verification service it runs on charges per query, reported under national maintenance. A payroll integrity check that costs the state money per employee is a design choice nothing on the record discusses. 2026-09-23 - the minister told Parliament that an electronic interface between home affairs and the electoral commission verifies identity details given at voter registration and voting against the population register, with biometric checks detecting duplicate, cancelled or blocked records. No transaction or rejection count is published.	MOVEMENT
South Sudan	Identity registration is reaching schools, which is distribution rather than a system consuming the identity. School-based national identity registration launched in August 2026, taking enrolment to where the population already gathers (schools). More than 4,000 processed cards and passports were distributed across the four counties of Greater Yei from July 2026 with European Union support (distribution). No second system reads the identity. Every record here is the identity programme extending itself.	MOVEMENT
Sudan	Banking is the one working case: the national number is verified against the registry at account opening under a December 2024 circular. The circular of 2 December 2024 adopts the national number alongside account-opening documents and requires banks to check it against the civil registry's own system to confirm validity (circular). The digital identity launched in May 2026 is intended for banking, telecommunications, education and healthcare (launch), and the earlier safety-net project entered registry data over an interface into its own management system (report). Outside banking and that closed project, the repository holds intentions rather than integrations.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tanzania	25 of 37 identified systems were connected to the civil registration system, and certificates now issue in 48 hours. The performance audit quantifies stakeholder-system integration with the civil registration system at 25 of 37 identified systems connected, 68 per cent, naming the local government hospital system and the health ministry's own records system among them. The registration agency operationalised 48-hour birth certificate issuance, which its chief executive framed as the gateway to national identity, passports, health insurance and education services. Which twelve systems remain unconnected, and what falls through as a result, is not stated. 2026-09-16 — the registration authority said it will link the national identity to nine services from four today, among them birth certificates, health insurance, the taxpayer number and driving licences. No timetable is given.	MOVEMENT
Togo	Telecom operators are compelled by decree to carry the number, the clearest case of a regulated third party doing so. The decree of 26 December 2024, gazetted 23 April 2025, requires the number for every subscriber, admits the identity card where no other document exists, and obliges operators to retain the data and report to the regulator. Statute extends the same duty inland: the number must appear on every administrative document, at the mortgage service under the land code, in health records and in employer files, and the 2022 amendment lists the registers that must carry it. Collection is not consumption. Nothing in the repository shows a system querying the agency to verify an identity, and the data-exchange platform that would let it was not in place at the last report held.	MOVEMENT
Tunisia	The national health identifier is the repurposed Covid-19 vaccination identifier, and a single social identifier was worked on at a ministerial session in August 2026. The health identifier was confirmed as the repurposed vaccination identifier in July 2026; three counts circulate at three scopes and do not contradict each other, no national coverage figure has been published and no public dashboard exists (identifier, pilot, portal). The social identifier sits inside the health half of a wider social-security reform decision, on the government's own communique (social). Repurposing a pandemic identifier as the permanent health identifier is a decision about scope that no published instrument governs, which is the same gap the health dataset's missing legal basis names. 2026-09-29 - the health minister set a target of a unique health identifier and a digital medical record for every citizen before the end of 2026; no coverage figure accompanied the target. 2026-10-07 - the Sahloul university hospital reported 180,000 health identifiers unified under the national health identifier, first among public hospitals.	MOVEMENT
Uganda	Seventy-four financial institutions had electronic verification access to the register as at June 2024, and a constitutional challenge to identity-based access was dismissed with each party bearing its own costs. The institution count reaches the repository through a central-bank annual report that is not itself held (institutions). The challenge was dismissed in June 2025; the case number is a specific miscellaneous cause, not the form circulated in secondary coverage (ruling, barrier).	NO CHANGE
Zambia	Passport and travel-document applications now require a national authentication account on the government service bus. The Electronic Government Act, 2021 creates a citizen card as the cross-system identity and authentication credential. 2025-12 — the home affairs minister announced that passport, diplomatic passport, refugee travel document and identity travel document applications are integrated into the government service bus and require a national authentication account — the clearest live downstream use of the authentication service by another government system. 2026-01 — an agricultural input voucher ran electronic know-your-customer across all 116 districts, the largest-scale consumption of identity the repository holds for the country.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zimbabwe	A cotton farmer biometric registry was cleared to proceed on the model of a tobacco farmer identity registry for which the repository holds no primary. The marketing authority was cleared to proceed with field teams stated for October 2025; that date is the acting chief executive's stated intention rather than a confirmed start (cotton). The tobacco registry is cited as the model the cotton registry emulates, and the repository holds no primary from the marketing board — only a secondary reference (tobacco). Biometric registration of farmers by commodity marketing boards, modelled on a system nobody has published anything about, in a country with no working national digital identity. A third farmer registry, run by a United Nations agency rather than a ministry, entered a second phase in October 2025 targeting 36,588 farmers across 12 districts in four provinces for the 2025/26 cropping season, with 14,915 registered by 30 October and completion expected in the first week of November (farmer registry). Three separate farmer registries on three separate applications is the pattern worth naming: each is built for the programme that funded it.	MOVEMENT
