PROGRESS REPORT

Strategies, plans and policies: progress report, October 2025 – October 2026

Edition of 2026-10-12 · compiled by Claude Opus from the documents in the Corpus repository

> *54 countries. Each row below is carried verbatim from that country's own progress report, which answers a fixed frame of indicators over the period; nothing is written here. A country not listed under an indicator has* **No evidence** *on it in its own report.*

DIGITAL TRANSFORMATION STRATEGY · ICT STRATEGY · BROADBAND STRATEGY · DATA STORAGE / CLOUD STRATEGY · DATA INTEROPERABILITY FRAMEWORK / ROADMAP · AI STRATEGY · DATA LOCALISATION POLICIES · DATA GOVERNANCE POLICY · OPEN DATA POLICY

Progress values. *Movement* — some form of progress, however minor, has been recorded. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the repository holds a standing position and nothing in the period touched it. *No evidence* — the repository holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Movement, regulations still pending*.

The place reports do not share one window; the period above is the range they span.

Digital transformation strategy

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The 2030 strategy's targets are unchanged, and the high commission seated a scientific committee in October 2025. The strategy was published in May 2025 targeting all public services online by 2030, 500,000 information and communication technology jobs and a fifth of national output from the digital economy, announced the day before. Its targets did not move in the window. 2025-10-23 - the high commission for digitalisation, created by decree in 2023, seated a fifteen-member scientific and technical committee, three of them from the diaspora. It had been operating without one. No delivery figure against any of the three targets is published, so what has been added is a governance organ rather than a measured position. 2026-09-08 - and what is published instead is description. State media restated the vision as resting on data-protection and cybersecurity laws and on local infrastructure including national data centres, and as aimed at transparency in public management and at combating administrative malpractice. It carries no target, budget or completion date, and sixteen months after publication the repository still holds no delivery figure against the 2030 strategy's own three.	MOVEMENT
Angola	The digital transition agenda now counts 218 structuring projects across six objectives, up from 214. 2026-03-05 — the agenda was restated at 218 structuring projects across six objectives and seven axes, against 214 when it was presented abroad in March 2025. The project count is the only published progress metric. Nothing states how many of the projects are complete, what any of them cost or which public services they produce, so the agenda's movement over the window is an increase of four in its own inventory.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	A 2031 digital strategy opened drafting in February 2026, beside a 2060 vision and a presidential programme to 2033; the portfolio then changed hands. 2026-02-05 — drafting of a digital strategy to 2031 opened with external facilitation, building on more than 3,000 km of fibre, the population register and more than 250 digital services, set out as a strategic vision the same month. A digital pillar of a 2060 vision was published in February. 2026-03-21 — the presidential programme for 2026 to 2033 commits to a data-localisation law, national supercomputers and a state platform monetising locally produced data, and counts a government artificial-intelligence super app among existing foundations, framed as a technology hub. Nothing held establishes that the super app exists. 2026-05-27 — the portfolio changed hands and the ministry was renamed for digital transformation and innovation with an explicit artificial-intelligence strategy mandate, created by decree after the April poll returned a new government. The same decree moved the budget programme codes, so any ministry-keyed budget series breaks at that date.	MOVEMENT
Botswana	An ICT roadmap to 2030 targets 100,000 ICT jobs within five years and a double-digit sector share of output; its priorities appear as projects in no estimates volume. 2026-03-09 — a roadmap to 2030 was set out at a policy dialogue, targeting 100,000 ICT jobs within five years and a double-digit ICT share of national output, following ministerial priorities stated in November 2025. The repository does not establish when it was adopted, the document is not held, and its named priorities appear as projects in no estimates volume. The institution meant to carry it has not arrived. A Digital Services Authority was announced in the ministry's plan for the year with no establishing instrument found, and it was publicly contested as duplicative a year earlier. Nothing is on record being built. An e-waste strategy is the one instrument that did land: launched in July 2026 with an inter-agency memorandum, and no targets, budget, collection volumes or implementation dates published. 2026-09-23 - the President said the SmartBots strategy would be formally launched in November 2026, with no budget or targets published. The strategy is older than its launch date suggests: Cabinet adopted it in February 2020 and implementation began that October, and a 2022 diagnostic found it to be an action plan on a website with no published text.	MOVEMENT a blueprint with no budget trail behind it
Burkina Faso	The digital ministry worked out its contribution to the 2026-2030 national plan in August 2026; the plan text, the digital component and any target are unheld. 2026-08-17 — a ministerial session considered what the digital transition ministry contributes to the RELANCE 2026-2030 national plan. No baseline was held before it. The plan text, the digital component, any budget line and any target are all unheld, so what the record shows is that the process is running and not what it will produce. What the country has instead of a published strategy is a list of twelve structuring projects, named across the ministry's own reporting and visible in this report as the data centres, the citizen service centres, the supervision centre and the white-zone programme. Each is traceable; the document that would tie them together is not. The territorial plan is being reworked. The authorities are revising the national plan for the digital development of the territory to a 2030 horizon, against an international telecommunications union figure putting about 70 per cent of the population off the internet in 2024. A revision under way, with no draft, budget, target or adoption date held.	MOVEMENT a process running with nothing published from it
Burundi	The ten-year public-service digitalisation master plan is in force and its financing project was reviewed at mid-term in March 2026. The Plan directeur de digitalisation des services publics 2023-2033 was adopted in Council of Ministers on 10 May 2023 and is the country's standing digital transformation instrument. 2025-11 — a high-level workshop under the Prime Minister's patronage turned the plan into an implementation roadmap across administration digitalisation, connectivity, financial inclusion, innovation and cybersecurity. 2026-03 — the World Bank conducted a mid-term review of the project financing that work. What the repository does not hold is any published progress measure against the plan: no service count, no target achieved, and no evaluation of the plan itself as distinct from the project funding it.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cameroon	The 2016 plan expired and a successor has been in preparation since 5 August 2024; what stands in its place is a ministerial roadmap for 2026. The project unit's own statement is the finding: the 2016 national digital plan's five-year validity has expired and a successor aligned to the national development strategy has been under preparation since 5 August 2024. Eighteen months on, no draft, adoption instrument or date is published. 2026-02-19 - the minister set out a 2026 digital transformation roadmap tied to the national development strategy and the head of state's end-of-year message, covering artificial intelligence, cybersecurity and electronic government. An annual address is not a strategy. Where planning is being bought rather than written, it is narrow: a six-month assignment to produce a master plan for digitising the public-procurement information system went to a consulting grouping for FCFA 241.36 million, the award named to the same grouping and the same sum in a second account a week later. Neither account gives an award date, a delivery timetable or the plan's relationship to the electronic procurement platform already in service.	STALLED
Cape Verde	The strategic bases of an Agenda Digital 2035 were approved by Resolução 72/2026 in May 2026, after the 2021-2025 action plan's horizon ended. The plan of record was presented to a lusophone interministerial meeting in March 2025 with interoperability between systems and electronic authentication as its stated components, and its horizon ended on 31 December 2025 with no extension or evaluation held. The digital economy strategy is in force by resolution for 2024-2030. 2026-05 - the Council of Ministers approved Resolução 72/2026 setting the strategic bases of an Agenda Digital 2035 on eight axes, naming fragmented initiatives and systems that do not communicate as the problems to overcome, with progress to be monitored by the information society observatory. The resolution text is not held; the account is a national newspaper's. 2026-08-06 - a strategic consultation in Praia was convened to feed a national diagnosis and the agenda's priorities. No draft, adoption date or budget is held. 2026-09-10 - the prime minister named state modernisation and digital transformation among the government's priorities for the new phase of its United Nations partnership. 2026-09-16 - a territorial programme for Maio was launched with internet-access, digital-economy and training projects, Fogo to follow; no budget is stated.	MOVEMENT the strategic bases of a 2035 digital agenda were approved by resolution after the 2021-2025 action plan's horizon ended
Central African Republic	The 2024-2028 national development plan remains the frame for the digital agenda, cited at a ministry platform launch in February 2026. The national development plan has been the governing framework since 2024 and is cited as the frame for the ministry platform launched in February 2026, reported again in March. It did not move in the window. There is no separate digital strategy on this ledger: the plan carries the agenda, and the round-table mobilisation total the ministry states for it appears in a source that reads as a rewritten press release and is not independently corroborated. The one sector plan that exists is for public finances, reported under data governance, and its costed operational version is still unpublished. The national digital plan never got past its studies. Drafting of Centrafrique Digitale 2025 was commissioned in 2018, its studies were presented in November 2021, and the financier's completion report records them as validated; no adopting act is held. A digital development agency was created by law in June 2023 to implement the national strategy, and a call for a firm to draft a costed government digitalisation roadmap closed in January 2025.	NO CHANGE
Chad	A national connectivity strategy launched with US$1.5bn of planned investment to 2030, with no implementation report, expenditure statement or monitoring framework published. The strategy was developed with lender support and external analysis; its horizon is rendered as 2030 in one account and as within six years in another (strategy, framework, registry). Nothing is published against it: no implementation report, expenditure statement or monitoring framework at any date. Its named components — a third mobile operator, the fibre backbone, the data centre — are each recorded separately and none has a delivery figure. An economic and social council adopted recommendations on the digital transition in August 2026; it is an advisory body, nothing binds government to act, and no response is on record (recommendations). The strategic plan for digital and postal development 2020-2030 was validated in July 2020 on nine axes and 30 programmes, costed at about XAF 1,453bn, and was the plan the minister presented to a United Nations commission in June 2024. No execution report is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	The 2028 strategy is unrevised and still the stated delivery frame, while the agency's board was seated in July 2026. The strategy has been in force since December 2018 with six axes and thirteen strategic orientations costed at KMF 52,995,160,485, and no mid-term review, revision or successor is on file. 2026-07 - the agency held its first board session, members having been named by decree of 11 June 2026, adopting rules of procedure, electing a bureau and examining the 2026 action plan, the bureau's composition reported separately. It had operated without constituted governance organs until then. The observatory designed in the same strategy as one of three bodies still does not exist, its establishment now to be paid for by an external loan with no domestic appropriation - the sector-measurement body whose absence is why no Comorian connectivity indicator series exists. 2026-09-16 - the digital agency and UNDP signed a memorandum to run a national digital readiness assessment covering skills, connectivity, public services, regulation and the digital economy, presented as a way to target the strategy's next investments. No timetable or publication date is stated.	MIXED the digital agency's board was seated seven years after the strategy designed it while the strategy itself is unrevised and its measurement body has never been created
Congo	A ministerial roadmap of five ambitions and nine programmes was published while the 2030 strategy still awaits a decree. The 2030 national digital strategy was completed with external support and is under general-secretariat review awaiting adoption by presidential decree; no adoption instrument is on file, the repository holds nothing on it dated before October 2025, and the predecessor strategy has expired. 2026-07-28 - a roadmap was set out publicly with five ambitions and nine programmes, delivery placed in an interministerial task force under the Prime Minister rather than the ministry acting alone, on a presidential instruction of May 2026. The roadmap reaches the repository through a signed opinion piece by an adviser rather than an adopted instrument, and a separate nine-point ministerial list of 10 July 2026 is not reconciled with it.	MOVEMENT
Cote d'Ivoire	A 2026-2028 ministerial digital roadmap on seven pillars and 40 priority projects replaced the expiring national strategy as the working instrument. The roadmap was presented at African Digital Week in June 2026 and to the ITU leadership on 8 July 2026, and is described as carrying seven pillars and 40 priority projects. The roadmap text itself is not held, and the pillar and project counts are ministry-sourced press claims with no published document behind them. Nothing on file states a budget, an implementing body or a monitoring arrangement for the forty projects. Governance is the gap the state now names. Closing a national workshop on prioritising public digital services in Abidjan on 4 September 2026, the digital transition minister argued for unified governance through a relaunched National Digital Council under the Prime Minister, calling it a condition of the state's digital transformation; the workshop settled on 59 priority services out of 620 mapped and ten quick wins to deploy by the end of 2026, against a paperless state by 2030 (workshop). It is an argument for a relaunch, not an instrument constituting one. The 2021-2025 national digital strategy set seven pillars; it names no adopting act.	MOVEMENT
Djibouti	A third national development plan was adopted by decree on 30 June 2026, after a period with no adopted successor plan. There was no adopted successor plan at the window's opening. 2026-06-30 - the 2025-2030 plan was adopted by decree in the Council of Ministers. The plan text is not held, so its digital content, costing and delivery arrangements are not established from anything on file. The standing frame above it is Vision 2035, in force at both ends of the window and cited in the June 2026 decree fixing ministerial attributions as the frame of the state's economic strategy.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
DR Congo	A sectoral digital economy policy 2026-2030 was validated and referred to the Council of Ministers, uncosted and unpublished. 2026-08-04 - the policy was presented and validated by government on axes covering infrastructure, digital transformation of the administration, the digital economy, innovation and start-ups, cybersecurity and data governance, and referred to the Council of Ministers for adoption. It is not published, not costed and not budgetable, and the validators' own conditions name what is missing: reliable baseline data and a completed costing. Behind it sits a national digital plan carrying a US$1.5bn envelope, US$1bn of treasury investment over five years plus US$500m of external partner support; no finalised plan document is locatable and the treasury half is an announcement rather than an appropriation. 2026-07-29 - a governance framework was launched with a digital maturity diagnostic and a proposed six-to-twelve-month timetable. The government's programme for 2024-2028, costed at US$92.9bn, commits to finishing the national digital plan and adds a digital identity and 50,000 km of fibre.	MOVEMENT
Egypt	The minister put the platform at about 245 live services on 9 September 2026, with more than 400 targeted by 2030, after a July statement of over 270 by end-2026 and about 450 by 2030. The repository's last count before the window is more than 170 e-government services, with no target series on record. 2026-07-21 - the minister set out 242 services, a target of over 270 by end-2026 and about 450 by 2030, under a legislation and governance pillar alongside digital transformation, technology localisation, digital infrastructure and capacity building, the nearer target having been stated in June. The apex body behind the strategy is on record for the first time: the Supreme Council of Digital Society was formed under Presidential Decree 501 of 2022 as amended by Decree 511 of 2022, chaired by the prime minister, with the central bank governor, the commander-in-chief and six ministers among its members. It approves the national strategy for a fully digital state, sets digital government service policy and assesses the adequacy of financing for digital transformation. No minutes or decision after its first session is on record. 2026-10-03 - the communications minister put the platform at about 250 services in September 2026, with 270 targeted by the end of the year.	MOVEMENT
Equatorial Guinea	The digital agenda launched in 2019 on 33 lines of action ran to 2025 and has produced no implementation report, budget figure or successor. It was aligned with three international frameworks and is the agenda a World Bank diagnostic assesses against, with the diagnostic's recommendations outstanding (diagnostic, priority actions). The national development strategy to 2035 commits to gradual privatisation of state telecom ownership, a universal broadband backbone across all regions, an updated telecoms legal framework and a science and innovation fund that may be financed by a special tax on oil and gas exports; the diagnostic's own digital recommendations, a one-stop shop, online business registration and a digitised commercial registry, remain undelivered (strategy text, economic memorandum). A consolidated action plan for the second half of 2026 was adopted in July with 35 strategic objectives under three national priorities, one of them restoring sovereignty over the national digital space; it is not yet financed and goes to the Council of Ministers, which decides what is recorded and funded (action plan).	NO CHANGE
Eritrea	No national digital transformation strategy is held. What exists is sectoral: a policy for technology in education and a geospatial framework action plan. The repository holds two sectoral instruments touching digital questions and no overarching one. The first is the policy for technology in education, which governs one sector. The second is a domesticated geospatial information framework action plan filed in April 2026, which concerns one class of data. Against that, the telecommunications union's own survey of national plans records the country as having no adopted broadband strategy. A country with a sector policy for schools, an action plan for maps and nothing for the network they both run on has no strategy in the sense this indicator asks about, and nothing on the repository records one being drafted.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eswatini	A digital readiness assessment published in November 2024 places the country at the systematic stage across all six of its pillars. The assessment was launched by the ICT ministry with a development agency in November 2024 and places the country at the systematic stage across digital public infrastructure, connectivity, government, regulation, economy and people (assessment). It finds that a national digital strategy is in place but that digitalisation holds only moderate political support, naming limited political prioritisation and coordination as the constraint on the government pillar (finding). The strategy the assessment refers to is not itself held, and no implementation plan or budget against the assessment's recommendations is published.	MOVEMENT
Ethiopia	Digital Ethiopia 2030 was launched in December 2025 on three pillars of access, equal opportunity and trust, and is the standing national strategy. The strategy sets targets of 128m subscriptions and an identity for every adult by 2030, together with a sevenfold rise in digital payments (Digital Ethiopia 2030). The council overseeing the programme restated in July 2026 that it is to be judged on lives changed rather than systems deployed, a claim with no published measure behind it. No implementation plan, budget allocation against the pillars or progress report is held. Digital Ethiopia 2025, the strategy the present one succeeds, was read in a 2021 United Nations study beside the 2016 ICT policy and the 2019 telecoms opening.	MOVEMENT
Gabon	There is no strategy document; the digitalisation ordinance of 11 August 2025 is the framework instrument, and the council adopted a national operating method for digitalisation projects on 22 May 2026. The ordinance applies to all State services and to public and private bodies, defines electronic, mobile, open, digital and smart government, and sets the principles of universality, interoperability, security, digital inclusion and national private-sector participation, with information systems required to be interoperable. It is a framework, not a plan: no national digital strategy document is held. 2026-05-22 - in one sitting the council approved a negotiated procedure to extend the national backbone as a concessive partnership, adopted a national operating method framing digitalisation projects across the administrations, and took draft decrees on start-up promotion and labelling and on creating a directorate general of emerging technologies. 2026-02-20 - the fifth steering committee of the two financed programmes validated 2025-2026 priorities and recorded disbursement rising from about 2.5 to 3 per cent in May 2025 to about 7 per cent. Seven per cent after four years is the delivery figure the strategy documents do not carry.	MOVEMENT
Gambia	The digital economy master plan for 2024 to 2034 is the framing instrument, with no mid-term review or costed implementation plan held. A ten-year science, technology and innovation policy for 2027-2035 was validated, after its minister conceded the previous one achieved none of its objectives (validation). It was adopted for a ten-year period and its position is unchanged (master plan). No monitoring report, budget allocation against it or delivery milestone appears anywhere in the repository, and no domestic budget appropriation for the digital sector is held at any date, so a ten-year plan runs without a measurable financing line behind it. 2026-09-04 - a second policy in the same space entered the repository and stopped at the same stage: a national digital government policy and roadmap was validated at a workshop convened by the communications and public service ministries, with no adoption, gazetting or published text since. The country's standing on the continental governance index moved from 28th of 54 in 2014 to 20th in the 2024 edition, at 54.7 of 100 - a composite governance measure, not a digital one.	MOVEMENT
Ghana	A second public-sector reform strategy was validated in July and August 2026, and runs to seven pillars. The draft runs to seven pillars, 27 programmes and 135 activities (programmes), and the document is expected to be ready by the end of 2026 before going to cabinet and Parliament (reform strategy). It was validated again at a stakeholder workshop on 12 August 2026, one pillar being digitalised public-sector systems, with no text, budget or adoption date published (validation). Lessons drawn from the first phase include delays in funding and incomplete implementation in some institutions (service delivery).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	Digital is pillar three of the national development programme, launched in November 2025 against a target of 20 per cent of gross domestic product. The pillar was launched at a continental summit the country hosted (pillar launch); two months earlier the summit's host profile named ICT one of the programme's five pillars (host profile). No implementation plan, budget line or interim milestone for the target is held, so the repository records an ambition stated at a summit and nothing measuring progress toward it.	MOVEMENT
Guinea-Bissau	The ENTD.GW strategy was launched on 29 January 2025 with ten pillars, six objectives and 55 interventions and approved by Decreto n.º 10/2025 in March 2025. 2025-01-29 — the National Digital Transformation Strategy 2025-2030 was launched by the prime minister and the minister responsible for digital transformation, with UNDP support and six strategic objectives, alongside ten pillars and 55 interventions. 2025-02-04 — a UNU-EGOV and UNDP follow-up meeting recorded that Council of Ministers approval of the strategy's decree was still pending, a step Decreto n.º 10/2025 then took, approving the strategy as its annex, promulgated on 28 March 2025, before the twelve months to 2026-08-26. The strategy is the instrument the World Bank-financed WARDIP programme and the UNDP Mais Digit@l grant both implement, so the financing behind it is moving. 2026-09-09 - UNU-EGOV presented the project document for implementing the strategy, setting priorities, governance structures, partners and resources; no adoption date is published.	NO CHANGE
Kenya	The digital public infrastructure roadmap is the section's central coordinating instrument and the repository holds no text of it. It is under development on five pillars, launched at an inaugural inter-ministerial steering committee (roadmap, launch). A technical-assistance tender was issued in July 2026 with offers closing 1 September, a German development agency having funded a work package inside a European service contract to develop a bankable national project; no roadmap document, timetable or cost is published (tender). The digital programme is named a priority sector in the FY2027/28 budget process, with no ceiling, figure or timetable published (budget process). The ten-year National Digital Master Plan 2022-2032 was launched in April 2022 with 19 flagship projects, on four pillars costed at KSh 484.2bn.	NO CHANGE
Lesotho	The National Digital Transformation Strategy: Agenda 2030 has been in force unamended since 2024, with no review or successor on file. The strategy was launched in 2024 and stands unamended (strategy). No mid-term review, progress report, costing or delivery schedule under it has been published, so the repository holds the instrument and no account of what it has moved.	NO CHANGE
Liberia	Digital Liberia 2025-2029 was published in February 2026 on eight priority areas across four pillars, with no costing or delivery schedule. The pillars include universal connectivity, digital addressing, cybersecurity and data sovereignty, replacing an ICT policy already past its stated period (strategy, text). A development bank's country strategy approved the same month still cites the superseded 2019-2024 ICT policy and does not mention the new strategy at all (country strategy).	MOVEMENT
Libya	The prime minister approved a National Strategy for Government Digital Transformation in April 2025, with no text or costing held; the civil service ministry began preparing a plan of its own in August 2026. The Ministry of Civil Service held a preparation meeting on 4 August 2026 for a national digital transformation plan, with no timetable, budget, lead agency or published document behind it (preparation meeting). The prime minister approved the National Strategy for Government Digital Transformation on 21 April 2025, set on four tracks: integrated digital government, a competitive digital economy, an inclusive digital society and a safe digital environment. The information authority's chairman, who led the committee that prepared it, named a national digital accessibility policy among its outputs. It is named elsewhere in this repository as the parent of the country's digital identity work, but no text, period, targets or costing for it is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Madagascar	The Plan Strategique Numerique 2023-2028 is the standing national digital strategy, with no published implementation report held. The plan is recorded as in force and is the country's only whole-of-government digital instrument on file (plan). No implementation report, mid-term review or costing under it has been published, and the projects recorded elsewhere in this ledger cite donor programmes rather than the plan as their authority. 2026-05-20 — the ministry put a Madagascar Digital 2030 vision to a World Bank delegation. No period, cost or adopting act is stated.	NO CHANGE
Malawi	The President directed all agencies to digitalise passports, identity cards, licences and procurement, while a draft transformation strategy is still in validation under the 2023-28 digitalisation policy. The directive was given in the State of the Nation Address against a target of 80 per cent internet usage by 2026, with no baseline given against which it could be assessed (directive); of the four named services only public procurement is evidenced as delivered inside the window (directive). A draft national digital transformation strategy went to a validation workshop in February 2026 and remains pre-adoption (validation, consultations). The 2023-28 policy remains the reference framework, with the e-government department under pressure to onboard all agencies onto the service bus intended to let ministries exchange data (framework, implementation, enforcement). A national digital readiness assessment was published by the information and digitalisation ministry with development-partner support, covering digital public infrastructure - data exchange, payments and identification - alongside connectivity and its physical layer (assessment). The held capture carries its front matter and contents; its scores, recommendations and any commitment made against them are not read out here. The Digital Economy Strategy 2021-2026 was recorded in February 2023 as finalised and awaiting Cabinet approval; no approval is held.	MIXED a presidential directive to digitalise four named services against a strategy still pre-adoption and a service bus that has never operated
Mali	A Conseil national du Numerique was recommended at the national digital week in August 2026 and has not been constituted. The recommendation came out of the Semaine du Numerique on 1 August 2026, which produced a set of proposals framed around digital sovereignty (recommendations). No council, founding text or membership is on record. The repository holds no whole-of-government digital strategy for the country either, so the coordinating body and the plan it would coordinate are both absent. A national digital economy policy and its 2025-2029 action plan were validated on 24 October 2024, the predecessor having been executed at 27.30%; the draft sets four axes and a digital development fund. No adopting decree is held.	MOVEMENT
Mauritania	The National Digital Transformation Agenda 2022-2025 has run out its period, and no successor agenda is held. The agenda set four axes and its period has since ended, with no successor, evaluation or extension on record (agenda). The pattern repeats across this unit: the cybersecurity strategy and the university research accreditation both expired in the same way, so what the repository records is a set of instruments that ran their term and were not replaced.	NO CHANGE
Mauritius	The Digital Transformation Blueprint 2025-2029 has an inter-ministerial committee behind it and no delivery report, milestone or revision published against it. The blueprint was launched in May 2025 with new digital regulations announced alongside it, and an inter-ministerial coordinating committee was established in August 2025 (blueprint, committee). Fifteen months on, nothing has been published against it (launch, regulations). Its interoperability commitments in particular have produced no instrument, and the framework they would replace dates from 2002. 2026-09-11 - Cabinet approved Vision 2050, a US$50bn economy target with digital among seven strategic sectors.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Morocco	Digital Morocco 2030 has been in force since September 2024 and picked up a US$250m acceleration programme in June 2026. The strategy's stated targets include a place in the global top 50 for electronic government and 100,000 people trained by 2030, and the technology sector was 6.8 per cent of gross domestic product on a 2025 figure (strategy). A US$250m programme was attached to it in June 2026 (programme). Two held sources give the 2030 jobs target as 150,000 and as 240,000, and the repository holds no progress report against any of the targets (programme). The digital development agency's 2020 orientations to 2025 targeted 85% citizen satisfaction, 2,500 startups and 50,000 young talents; the present strategy followed in 2024.	NO CHANGE
Mozambique	The national digital transformation strategy is still unpublished, while an agency and a technical commission were created in March 2026. Drafting was formally launched in February 2026, with more than 700 stakeholders engaged across six regional consultations and validation workshops, and no text published by August (launch, engagement). A donor project recorded in January 2026 that its own strategy work had been deprioritised against the ministry's stated preference for implementation over new policy documents (deprioritisation). A Digital Transformation and Innovation Agency was created with a remit covering interoperability of state platforms, data-centre integration and procurement (agency), and a Multisectoral Technical Commission by decree of 10 March 2026 (commission). The integration roadmap the commission was to draft by mid-2026 is not on record. 2026-09-15 — an operational plan was begun: the agency set priorities for 2026-2029 around a common architecture, a sovereign cloud and data centre and a national interoperability platform. Nothing is costed or dated. 2026-09-21 - the plan went before the technical commission, which expects to harmonise and cost it within two to three months, and the state administration minister said data produced by the administration must belong to the state.	NO CHANGE in drafting at both ends while two coordinating bodies were created above it
Namibia	A National Digital Strategy was published in August 2025 and a ministry strategic plan and ICT policy launched in January 2026, with neither text held. The digital strategy is in force and the national data centre it calls for was still at concept-note stage a month after publication; the document itself is not held and two sources give its period differently (strategy, readiness). The ministry's strategic plan and national ICT policy were launched at Opuwo in January 2026, prioritising affordable broadband and mobile coverage in rural and underserved areas, cybersecurity, data protection and electronic government, and naming high data costs, limited infrastructure and unequal access as the barriers; neither document text is held (plan).	MOVEMENT
Niger	A national digital-development policy for 2026-2035 went to national validation in March 2026 on three strategic axes, and has not been formally adopted. A redrafting committee was installed in July 2025 with one month to update the draft (committee). The validation workshop of March 2026 covered governance and security of the digital sector, infrastructure and services, and skills and innovation, targeting 2035 and aiming to position the country as a regional fibre-interconnection hub (validation, interview). It is not yet formally adopted, so the country's connectivity build is running ahead of the policy that would frame it.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	A presidential committee and a civil service working committee sit above a digital public infrastructure framework still in development against a 2027 services target. The presidential committee on implementation was constituted in May 2025 and is operating (committee). An eleven-member civil service technical working committee was inaugurated in August 2026, tasked with drafting the architecture, roadmap and governance mechanisms within one week ahead of a steering committee; no terms of reference, budget or publication commitment is stated (working committee). The framework itself remains in development against a target of 75 per cent of public services digitised by 2027 on an integrated-government model (framework). All three sit beneath the National Digital Economy Policy and Strategy 2020-2030, issued in November 2019 as an eight-pillar roadmap. No review of it against its own targets is held. 2026-07 — the communications minister paused enforcement of new rules on internet platforms pending a unified digital-economy framework, with a joint committee of the three digital regulators to resolve overlapping mandates. No timetable is given. 2026-09-30 - the public service reform bureau's director general said the President has approved renewal of the National Strategy on Public Service Reforms, to take in policies on artificial intelligence and blockchain.	MOVEMENT
Rwanda	A national digital public infrastructure strategy was launched at a first national infrastructure day in March 2026, and the strategy document itself is not held. The launch was at the country's first national digital public infrastructure day in March 2026, framed as laying groundwork for artificial intelligence and inclusive growth (strategy, launch). The document is not held, so its sequencing, targets and financing cannot be checked against the identity, payments and data-sharing components that are separately recorded here.	MOVEMENT
Sao Tome and Principe	A National Strategy for Digital Governance adopted in 2020 runs on nine thematic axes, and a Public Administration Reform Strategy approved in 2025 names electronic governance its essential pillar. The digital governance strategy is a whole-of-government instrument on nine axes; the source page is undated and the year is taken from its context, so even the strategy's own date rests on inference (strategy). The reform strategy was presented as newly approved in June 2025 with electronic governance named as its essential pillar (reform). Neither carries a target, budget, milestone or review published anywhere the repository can reach, so what either instrument commits the state to is unstated. 2026-07-15 - the Integrated Financing Strategy for Development was published, naming digitalisation of tax and customs and a digital government platform for oversight of public finance among its 2026-2030 actions.	NO CHANGE
Senegal	A technology strategy carries a stated FCFA 1,105bn envelope across twelve programmes to 2034, above a digital council with no published output and a steering committee not yet operating. The strategy launched in February 2025 with the stated envelope across twelve priority programmes to 2034; the dollar equivalent in circulation rests on an undated conversion and is not a second figure (envelope, strategy). A national digital council was inaugurated in October 2025 with twenty members, its mandate covering personal-data protection and cybersecurity advice, and no published output is held (council, projects). A digital governance steering committee was created in March 2026 and was still stated to be operational in the near future five months later (committee). 2026-09-04 - the roadmap's shape was stated at an international forum: 54 projects across 12 programmes, US$2bn over ten years, of which US$700m is unallocated. The figures are the government's own; no project list, allocation schedule or financing plan for the unallocated third is published. 2026-09-08 - the new prime minister's general policy declaration kept the New Deal as the framework, named a sovereign cloud for sensitive state data and required projects to prove feasibility, financing and impact before implementation. The ministry's sector policy letter for 2025-2029 went through its final validation workshop on 10 February 2025; no signed text is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Seychelles	The President reaffirmed a fully digitalised electronic-government target for 2030 while receiving a foreign envoy's credentials, exploring bilateral technical cooperation. The restatement came in August 2026 at a credentials ceremony (target). No strategy document, delivery plan, milestone set or budget for the target is held at any date. What the repository can show against it is a relaunched portal, an electronic case management system, a certificate of origin, a business one-stop portal in pilot, and an invoicing system at procurement — five services, no plan. Cabinet approved a forum in September 2026 to agree a national digital architecture. The finance ministry's review for the continental agenda names a National Digital Economy Action Plan as the roadmap and a Digital Economy Agenda in development; neither text is held.	NO CHANGE
Sierra Leone	A National Innovation and Digital Strategy 2019-2029 is the standing frame, with a Digital Development Policy under it. The strategy runs on a three-part philosophy of digital identity, digital economy and digital governance, and on three principles - mobile-first, country-as-AI-lab and hybrid technology systems (strategy). The sector policy that operationalises it, Towards a Digital Economy, was issued in 2021 (policy). Both predate the current ministry, and neither has a published mid-term review, delivery report or successor in the repository. The strategy's own window closes in 2029. Above both sits the Medium-Term National Development Plan 2024-2030, the Big Five Game Changers agenda that carries the data and census commitments.	NO CHANGE
Somalia	A Digital Transformation Strategy 2025-2030 was in finalisation with international support, while domestic analysis names interoperability as the central risk. The strategy was in finalisation in October 2025 and no adopted text has entered the repository since (strategy, context). A domestic analysis and the national digital public infrastructure summit communique both name interoperability between government systems as the central risk; the analysis argues the danger is digitising the existing fragmentation rather than failing to digitise (analysis, summit). That argument is the sharpest domestic critique in this ledger, and it is aimed at a strategy that has not yet been published.	MOVEMENT
South Africa	The Cabinet-adopted roadmap is unchanged, but Operation Vulindlela's reporting moved from 80% of initiatives on track to uneven and slower than anticipated. The instrument itself did not move. The Digital Transformation of Government Roadmap was approved by Cabinet in March 2025, before this window opened, and nothing in the twelve months amends, replaces or reviews it. What moved is the account of its delivery. A briefing in April 2026 put 80% of digital transformation initiatives on track with a fifth complete. The quarterly report of July 2026 replaces that with a statement that progress has been uneven and in certain instances slower than initially anticipated, and publishes no later percentage. A quantified claim withdrawn and not restated is a worse position than the one it replaced, whatever the underlying delivery did. Cabinet's own diagnosis of the problem — interdepartmental coordination, outdated systems, overlapping mandates and limited skills — names institutional fragmentation rather than technology. A 2021 final draft ICT and digital economy masterplan was never published as adopted; the department planned a digital economy framework and strategy for Cabinet in 2023/24.	REGRESSED the roadmap stands and its own delivery reporting withdrew a quantified claim
South Sudan	A presidential decree ordering full digitisation set a January 2026 adoption deadline, and the deadline passed without a compliance report. The decree granted an electronic services council full authority over the digitisation of public institutions (decree). The deadline passed and nothing on file records compliance, an extension or a report against it. The country is placed 192nd of 193 on the international electronic government index for 2024. A decree with a deadline and no compliance mechanism is the shape of much of this ledger, and the reason is recorded separately: there is no operating gazette in which an instrument can be published or checked. 2025-06 — the ICT minister said the government is implementing the 2012 ICT policy, a 2023 digital government strategy and a 2024 digital roadmap while developing a new digital transformation strategy. None of the three later texts is held.	STALLED

COUNTRY	DEVELOPMENTS	PROGRESS
Sudan	A Digital Transformation Authority was established by prime-ministerial decree alongside data, artificial-intelligence and cybersecurity authorities, and no account connects the decree to the platform claims that follow it. Three authorities were created at once by decree: digital transformation, data and artificial intelligence, and cybersecurity (decree, roundup). No account held connects the institutional decree to the platform launches recorded through 2026 — the national platform, the identity credential, the payment switch — so which authority owns which system, and under what powers, is not established anywhere in this repository. That gap runs through the whole unit: institutions are announced by decree, systems are announced by ministry, and nothing published links the two. The ministry launched phase two of its 3x3 transformation plan, naming consular, visa, university, business-registry and identity services and an interoperability gateway as its pathways (phase two). No text of the plan is held. A development partner's country programme records no digital public infrastructure policy framework in place at 2025 and targets one by 2028 (programme).	MOVEMENT
Tanzania	A Digital Economy Strategic Framework 2024-2034 opened its implementation year, and the repository holds no dated 2025 progress position against any of its targets. Targets were restated at an annual conference in January 2026, and the framework is held as stated intent only (framework). The sector's contribution to gross domestic product carried into that restatement is a 2022/23 figure carried forward, with nothing dated 2025 or 2026 on file (contribution). A ten-year framework whose headline economic measure is three years stale at its own implementation launch is the position, and it is the frame for the delivery counted below. 2026-09-16 — the planning ministry presented e-Delivery as the system to track every state development project from planning to execution, with fund releases matched to it. 2021-04 - the e-government agency's five-year strategic plan set targets to June 2026, among them shared government data-centre infrastructure and 300 institutions on the government network and data centres; the ledger holds no outturn against them.	NO CHANGE
Togo	A national digital strategy for 2025-2030 reached consultant procurement with no adoption reported, under a government roadmap whose text is not held. Neither the 2020 strategy nor the 2025-2030 draft is held, and the repository does not settle whether the two names denote one instrument or two (strategy, toolbox). The roadmap for 2026-2031 is present only through the government's own account of a private-sector contribution workshop convened under it; the government said it would specify by the end of 2026 the reciprocal commitments it will offer the private sector (roadmap, financing). At a national review on 28 August 2026 the finance ministry reported an average reform implementation rate of 68.4 per cent at end-June 2026, the digital items named being expansion of biometric identification and a broadened mandate for the national cyberdefence company (reforms); the digital share of that average is not separated out.	MOVEMENT
Tunisia	The digital-transformation vision is now carried inside the 2026-2030 development plan, whose sectoral volume holds the digital chapter and was approved by statute in July 2026. The communications minister said on 9 October 2026 that the postal operator has a 2026-2030 strategy built on digital transformation, with artificial intelligence and digital identity to be integrated into the postal system, and a resource-planning system already being introduced in phases. All three volumes of the plan's digital annex are held (annex). A ministerial council in February 2026 placed 192 projects under national follow-up and declared 2026 the launch year, and set out the unified national vision for digital transformation carried within the 2026-2030 development plan (vision). A further ministerial council was held under the head of government in August 2026, and the decisions taken are not itemised in the record held (council). A plan chapter approved by its own statute is a different instrument from a sectoral strategy, and it names no delivery machinery of its own. 2026-08-28 — a head-of-government circular directed ministers, secretaries of state, heads of public enterprises and state controllers to adopt strategic action plans on the governance and performance of public establishments, invoking among its legal bases the 2020 decree-law on electronic data exchange between public bodies (circular).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Uganda	A five-year technology authority strategic plan was launched in June 2026, and the plan document is not held. The plan covers financial years 2025/26 to 2029/30 and was launched in the capital (plan). Its one figure that reaches this report is an agency-integration baseline for the government data exchange, recorded separately. A five-year plan whose text is unavailable is the frame for a unit that otherwise reports a great deal: 143 sourced rows, and the governing strategy is not among them.	MOVEMENT
Zambia	The 2023-2027 strategy is in force and its implementation now reports against measured connectivity, with bulk international bandwidth out to bid. The National Digital Transformation Strategy 2023-2027 sets out five digital-transformation pillars and is the standing instrument. 2026-02-25 — the acceleration project invited bids for pre-purchase of bulk dedicated international bandwidth capacity for the one government network, a concrete implementation step rather than a plan. 2026-05-14 — the third digital economy round table recorded 94 per cent connectivity coverage, quarterly public quality-of-service reporting and K255 million approved for network-quality upgrades. The strategy is being reported against connectivity numbers; no progress measure against its own five pillars is published. 2026-09-10 - the new term's Grow Zambia Agenda 2026-2031 carries eight digital-infrastructure targets, with a real-time Cabinet monitoring dashboard being built; the targets themselves are not published.	MOVEMENT
Zimbabwe	National Development Strategy 2 was launched in December 2025 for 2026 to 2030, and Cabinet names it with three standing instruments as the digital agenda's frame. NDS2 was launched on 8 December 2025 as the successor national plan for 2026 to 2030, presented as the outcome of broad-based national consultations taking in the private sector, faith-based organisations, development partners and the diaspora (launch, strategy). Cabinet's briefing of 14 July 2026 names NDS2, the Smart Zimbabwe 2030 master plan, the National ICT Policy and the National AI Strategy 2026-2030 as the frameworks the digital transformation agenda runs under (briefing). The repository holds no single whole-of-government digital transformation strategy. The agenda is carried by four documents of different vintages, two of which state no adoption date of their own (ICT policy, master plan). 2026-09-04 - planning moved a generation further out: the ICT ministry's permanent secretary was appointed to the parliamentary body planning a thirty-year national roadmap to 2056, which the ministry presents as putting the sector at the centre of long-term national planning. No terms of reference, membership list or work programme is held, and the roadmap does not yet exist.	MOVEMENT

ICT strategy

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The national digital transformation strategy announced in May 2025 governs, with a high commission and a digitalisation oversight body beneath it. Algeria's strategy is settled and its machinery is what moves. The national digital transformation strategy was announced in May 2025, with a high commission for digitalisation set up on expert-panel advice and a separate oversight body running the national services portal. Nothing in the twelve months to September 2026 amends or replaces the strategy itself. What the window shows is delivery under it — a national digital services centre inaugurated in July 2026 and a second national data centre at Blida — rather than a new statement of direction. 2026-09-19 - the high commission trained sector information-systems managers on deploying the mechanism for verifying electronic documents issued through the national portal, under a presidential instruction of 12 July 2026 to widen the portal's uses and strengthen cross-sector interoperability. No count of sectors, documents or verifications is published.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Angola	The white paper for 2023-2027, approved as an annex to a presidential decree, is the operative national strategy for the sector. The strategy is settled and its text is on the repository: the white paper for information and communication technology 2023-2027, approved as an annex to a presidential decree of December 2024 and replacing the 2019-2022 edition. It is what the sector's connectivity, cybersecurity and inclusion commitments hang from. Two subordinate strategies sit under it: a national cybersecurity strategy adopted by decree in December 2025, and a national artificial intelligence strategy that a UNESCO readiness assessment still found missing in June 2026. Nothing in the twelve months to September 2026 amends, extends or supersedes the white paper itself. 2019-07 — a presidential order approved the 2019-2022 white paper and repealed the 2011 order before it, the edition the current white paper replaced.	NO CHANGE
Benin	The policy that preceded it has no adopted successor, and drafting of a 2031 digital strategy opened in February 2026. 2026-02-10 — the ministry records that the prior NTIC policy has no adopted successor and that a multi-stakeholder process to draft a stratégie numérique 2031 had just begun. That is the ministry's own statement of the gap, and it is what makes the position stateable at all. 2026-01-19 — the government reports a GovTech Maturity Index 2025 score of 0.723 overall and 0.863 on online public services. The delivery is real and it has been achieved without an adopted sector strategy behind it. The sector policy declaration for 2016-2021 set six flagship projects and six structural reforms. Its term ended in 2021.	MOVEMENT
Botswana	The 2007 Maitlamo policy remains the only adopted national ICT policy; the 2030 roadmap that has replaced it in ministerial usage carries no adoption date. 2025-08-17 — Parliament passed the Digital Services Bill and the Cybersecurity Bill under certificate of urgency, the legislative core of the current agenda. 2026-02-09 — the national digital-ID programme is named among the strategic projects the 2026/27 budget analyses under the economic transformation plan. The repository holds no revision of the 2007 policy and no instrument adopting the roadmap.	NO CHANGE the adopted policy is nineteen years old
Burkina Faso	The national digital economy strategy runs to 2027 on five programmatic pillars, and FCFA 9.1131bn of 2026 procurement was authorised in April for a twelve-project programme to 2030. The strategy of record is the national digital economy strategy for 2018-2027, whose existence and five programmatic pillars are recorded in the ministry's own maturity diagnostic of the public administrations. The strategy text itself is not held and no monitoring report against its pillars is published. 2026-04-16 - the council of ministers authorised FCFA 9.1131 billion of 2026 procurement for the digital ministry's twelve major projects to 2030, naming an elite information-technology programme, citizen houses, data centres, the state network and institutional capacity — the strategy moving from stated ambition to a funded line. What sits beside it is a strategy still being written: the digital ministry is working out its contribution to the national recovery plan, with no draft or adoption date held.	MOVEMENT
Burundi	The national ICT policy ran to 2025 and has expired with no adopted successor; sector strategy is now to be written under a long-range vision instead. The Politique nationale de developpement des technologies de l'information et de la communication was adopted in Council of Ministers on 13 July 2011 for a term running to 2025. Its term has expired and no adopted successor was located. 2026-07-03 — the Prime Minister instructed ministries to produce implementation documents for the Vision 2040-2060, with public-administration digitalisation and e-government among the first priority programmes. That is now the mechanism by which sector ICT strategy is to be written, and it is a process rather than a strategy: no document, timetable or budget is published.	REGRESSED
Cameroon	The 2016 national digital plan expired with its five-year validity and a successor is still in preparation. The strategic plan that carried Cameroon's digital policy dates from May 2016 and ran to 2020, making broadband infrastructure its first axis (plan). A successor aligned to the national development strategy has been under preparation since the plan expired (successor), with a roadmap discussed in February 2026 (roadmap). No adoption instrument is held, so what governs is sectoral rather than general. The ICT agency's 2007 national strategy set twelve priority axes and a plan for 2008-2015, in a text that describes itself as a working draft.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Cape Verde	The digital economy strategy for 2024-2030 was approved by resolution and gazetted on 4 October 2024, and the strategic bases of a successor Agenda Digital 2035 were approved by Resolução 72/2026 in May 2026. The strategy of record was approved by resolution for 2024-2030, setting the vision of a Nacao Digital, six strategic pillars and 37 strategic objectives, with coordination, implementation, monitoring, evaluation and revision vested in the digital economy ministry through its telecommunications and digital economy directorate. Its full pillar-by-pillar text still carries implementation of an artificial intelligence strategy as a measure yet to be taken. The preceding action plan's horizon ended on 31 December 2025. 2026-05 - Resolução 72/2026 set the strategic bases of an Agenda Digital 2035 on eight axes, from digital government and fintech to cybersecurity and legal reform; its text is not held, and a strategic consultation in August 2026 was still gathering its priorities. 2026-02 - the national 5G strategy was presented on 11 February as a structuring instrument framing the phased introduction of the technology, developed jointly by the digital economy ministry and the regulator, and approved by resolution nine days later.	MOVEMENT
Central African Republic	No standalone strategy. Digital sits inside the national development plan for 2024 to 2028 and the investment programme beside it. The Central African Republic governs its digital agenda through general planning instruments rather than a sector strategy. The national development plan for 2024 to 2028 is the framework, with the investment programme launched in September 2025 as the financing envelope. One sectoral strategy is on the repository and it is narrow and old: a government-wide cloud strategy recorded as planned in a financier's status report of December 2023. Nothing since records it adopted. The ministry's 2026 orientations are the most recent statement of direction and are not a strategy document.	NO CHANGE
Chad	One article of the 2014 electronic communications and postal law was amended by ordinance, ratified by the Senate in December 2025 after the National Assembly in October. The ordinance was signed in August 2025, approved by the National Assembly on 22 October by 105 to 31 with 2 abstentions, and ratified by the Senate on 23 December by 65 of 67 (ratification, framework). The 2014 law is held only as a degraded scan with a proxied date, the two accounts number the instruments differently, and the amendment's subject is described as licence award conditions while the held article sits under sanctions (law). So a sector statute was amended by a route the repository can date and on a subject it cannot confirm.	MOVEMENT
Comoros	The digital code's own 2024 adoption target passed with nothing adopted, and nothing since 2021 re-dates it. The code was recorded in March 2021 as not adopted, with a 2024 target already at risk. That target passed and the code is still not adopted, checked at 2026-08-04. The target was set by the digital agency itself, and nothing since 2021 records the programme as abandoned or re-dated. The whole legislative position for this country is known through one agency account five years old, which is why the staleness is the finding rather than any particular status.	STALLED
Congo	Decret 2019-150 approved the national digital economy strategy, gazetted 4 July 2019. Decret 2019-150, gazetted on 4 July 2019, approves the national digital economy strategy — the instrument behind Vision Congo Digital 2025. UNESCO's 2026 assessment of internet development sets the adoption of that strategy and of the legal frameworks against insufficient enforcement of the cybersecurity and data-protection laws, high connectivity costs, persistent rural-urban disparities and limited public participation in internet governance. No mid-term evaluation of the strategy against its own targets is held.	NO CHANGE a standing instrument the repository holds for the first time

COUNTRY	DEVELOPMENTS	PROGRESS
Cote d'Ivoire	The 2021-2025 national digital development strategy remains the named umbrella instrument, with no successor text published. The strategy was in force and expiring at the window's opening. A year later the ministry's own roadmap is stated to sit under the national digital development strategy and the 2026-2030 development plan rather than to replace it. No successor national digital strategy has been adopted, published or dated in any held source, and the repository holds no text of the expiring one either. What exists in its place is a ministerial instrument of lower standing, which is a different thing from a national strategy renewed. The 2024 electronic communications law, promulgated on 6 June 2024 and repealing the 2012 ordinance, is in force, with operator compliance plans evaluated and licence terms under revision, and the regulator's new six-year council took office in May 2026.	NO CHANGE
Djibouti	The national ICT development policy is still the framework the ministry cites, with no adopted successor on file. At a world summit in July 2025 the communications minister based his account of national progress on the Politique Nationale de Developpement des TIC as the reference framework, naming broadband deployment and two donor projects as its delivery vehicles. 2026-02 - a World Bank supervision report records a decision to begin updating the Smart Nation strategy to align it with the new national development plan and the new cybersecurity agency. The ministry's own October 2025 stocktake still lists a national digital strategy and sectoral roadmaps among the things to be elaborated. Neither policy text is held here, so what either contains is not established. The Schéma Stratégique Intégré, adopted in 2014 as the government's ten-year ICT roadmap, provided for the national ICT development strategy; its term ended in 2024. A council chaired by the President was organised by decree in August 2023 to approve and monitor the digital-economy strategy, and no sitting of it is held.	NO CHANGE an update to the Smart Nation strategy initiated but not adopted
DR Congo	The 2019 plan set four pillars to a 2025 horizon that has now passed; its successor for 2026-2030 has no finalised published document. The plan of record was validated at a national workshop in September 2019 under the head of state's authority, on four strategic pillars — infrastructure, content, applicative uses, and governance and regulation. No separate enacting decree was found; the plan records only the decision creating its own validation workshop's organising committee. Its horizon has passed. The successor plan for 2026-2030 carries an announced envelope of treasury investment over five years plus external partner support, with no finalised published plan document locatable. 2026-08-04 - a sectoral digital economy policy for 2026-2030 was validated and referred to the council of ministers for adoption, on axes covering infrastructure, digital transformation of the administration, the digital economy, innovation and start-ups, and cybersecurity. Seven years after the last adopted plan, what the repository holds is two documents awaiting adoption and one whose term has run out.	MOVEMENT
Egypt	105 government entities are connected and 242 services live on the national platform, under the ICT 2030 strategy. The strategy runs on three pillars of digital transformation, digital skills and jobs, and technological innovation. 2026-01-02 - the ministry's annual statement puts the national platform at 210 services and 10.7 million users, and a 47-place improvement in an international ranking. 2026-07-19 - a cabinet follow-up meeting recorded 105 government entities connected electronically and 242 services available on the platform - 32 more services in six months, on the government's own count.	MOVEMENT
Equatorial Guinea	An international tender to draft a replacement telecommunications law opened in June 2025 and has produced no award, draft or revised timetable. The tender was scoped to cover artificial intelligence, cybersecurity, critical infrastructure, satellite connectivity and data protection (tender). Fourteen months on, the 2005 statute still governs a sector that has since acquired a second state operator, an offshore satellite authorisation and a directorate for artificial intelligence, none of which it contemplates.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	The sector rests on a 1998 communications proclamation and its regulations; the only sectoral policy named is for education. The repository holds no national digital or ICT strategy for this country. What it holds instead is the sector's legal furniture, listed in a country profile and not held as text: Communications Proclamation 102 of 1998, which set the legal basis for communications, the Regulations on Telecommunications Networks and Services issued as Legal Notice 43 of 1998, and a 2003 proclamation establishing the state telecommunications corporation. The one sector-specific policy named anywhere is a National Policy for ICT in Education setting goals for connectivity, ministry systems, staff training and school use of technology. The 2018-2022 National Education Sector Plan carries it forward, aiming at technology infrastructure and e-learning options, on the back of an ICT in education initiative the ministry launched in January 2005. The sector plan states its own result: incorporating technology in education remains difficult for want of facilities, equipment and teacher training. Neither the policy nor the plan is held as a document, and the profile carrying them is a legacy platform its publisher states is no longer updated.	NO CHANGE a first stated position with no earlier account behind it
Eswatini	The national ICT policy dates from 2006 and the ICT ministry's own 2024/25 report to Parliament still runs against it. The 2006 policy, adopted by Cabinet that August, is the identifiable national ICT policy; an implementation plan was drafted for 2012 to 2016 and no replacement is held (policy). What is moving is financing and legislation rather than strategy. A World Bank grant of US$2 million funds eighteen months of preparation for the Digital Eswatini project, including a consultancy to write a digital roadmap and implementation plan (procurement plan). The Senate moved in February 2026 to take the Critical Infrastructure Protection Bill at the stage it had reached in the preceding session, sponsored by the ICT minister (order paper). Neither produces a strategy: the roadmap is a consultancy not yet let, and the Bill is not an Act. 2026-10-06 - the ICT minister told senators that E26m of the guaranteed US$26m loan goes to the post office pension fund, after Parliament approved the guarantee. The regulator's 2022 sector report records an Eswatini Digital Strategy as in preparation; nothing later is held.	NO CHANGE a policy of 2006 still named as the governing framework
Ethiopia	The Digital Government Strategy and Enterprise Architecture 2024-2029 went to final review in July 2024 ahead of government approval, with no revision on the record. The strategy and its enterprise architecture, to run to 2029, were presented at a final-review workshop in July 2024 ahead of submission for government approval (the strategy). The repository holds nothing on implementation against it: no progress report, no compliance review and no register of systems assessed against the architecture. The national ICT policy was revised and endorsed by the Council of Ministers in 2017, on a research network's profile. The text held is the final draft of September 2016, which proposed a national ICT council and a data-protection law.	NO CHANGE
Gabon	Sector policy is applied through the regulator rather than stated in a document: it approved a five-year passive infrastructure-sharing contract between the two mobile operators on 11 June 2026. The regulator gave its conforming opinion to an infrastructure-sharing contract covering telecommunications pylons across the national territory, examined before the opinion issued, its stated purpose mutualisation to avoid redundant deployment, lower costs and extend coverage. That is what sector policy consists of here. No national information and communications technology strategy document is held, and the digitalisation ordinance is a framework for how the administration digitises rather than a plan for the sector. Where the sector's own infrastructure is concerned the position is fragile rather than planned: a massive outage took the national fibre network down in August 2026, the government announcing an investigation after copper cables were stolen.	MOVEMENT
Gambia	The 2018-2028 ICT policy is still inside its stated period and has been overtaken by the 2024-2034 master plan. The eight-pillar policy statement issued in December 2017 was the foundational instrument and runs on paper to 2028. It was overtaken rather than repealed: the National Digital Economy Master Plan 2024-2034 now carries the sector's direction, leaving two instruments with overlapping periods and no published statement of which governs.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	The digital economy policy and strategy is the standing instrument, and a mid-term review sharpened the financed project onto it. The Cabinet-approved digital economy policy and strategy is the successor to the 2003 policy and runs on four pillars of infrastructure, skills, trust and innovation. 2025-09-03 - the minister launched a national digitalisation study described as a roadmap for the country's digital journey and restated the four pillars; the study itself is not published. 2025-12-09 - a development bank mid-term review mission concluded with an agreed roadmap sharpening the financed acceleration project onto high-impact activities and aligning it more closely with the national strategy. The roadmap is not published either, so what was sharpened is stated and not shown. The 2003 ICT for Accelerated Development policy set fourteen pillars, delivered through four-year rolling plans to 2018, and gave itself a life of 15 to 20 years. No repeal is held.	MOVEMENT
Guinea	The digital portfolio lost its substantive minister by decree in August 2026, six months after the ministry was merged and reshaped. The ministry was formed by merger in February 2026 and the minister held it unchanged through the July 2026 reshuffle (formation, reshuffle). He was dismissed by presidential decree made public on 21 August 2026 with no reason given, the ministry's secretary-general appointed interim head; named successors in circulation are publications' own speculation (dismissal, succession talk). A National Assembly committee on communication and information technology was constituted and held its first working session on 7 August 2026, naming mobile money, social-media regulation and network security as priorities on its chair's own statement, with no work programme or timetable published (committee). The ICT policy and strategies for 2016-2020 set three pillars, 17 axes and 89 actions, costed at GNF 1,500bn over five years. Its term ended in 2020.	REGRESSED
Guinea-Bissau	The US$60m regional digital programme launched nationally in August 2026, giving the 2025-2030 strategy a delivery vehicle. The national digital transformation strategy for 2025-2030 sits on the ledger as enacted and approved. What it lacked was money and a programme. Both arrived: the programme launched nationally in August 2026 covering connectivity, data protection, the digital economy and electronic government, described by the minister as a pillar of effective public services, with a procurement plan and implementation reporting behind it.	MOVEMENT
Kenya	A business process outsourcing policy is claimed delivered with no text or adoption date on file, and the authority bill behind it is unwritten. Both sit on the ministry's forward legislative list, the outsourcing policy claimed as delivered and the authority bill named as a priority with no text, sponsor or stage held (legislative push). A harmonised county wayleave framework was agreed between the information technology and devolution departments, to be tabled at the intergovernmental sector forum, with no framework text, timetable, cost or wayleave figure published (wayleave framework). The communications regulator called a validation forum for 30 September 2026 to finalise its draft guidelines for commercial internet telephony services, after a public consultation whose responses it has published.	NO CHANGE
Lesotho	The National Digital Policy 2024 remains in force and unamended, sitting alongside the transformation strategy issued the same year. The policy was issued in 2024 and is recorded as in force, unamended (policy). Nothing on file records an implementation plan, a regulator instruction issued under it, or any assessment of its effect. The 2005 ICT policy superseded the 1999 telecommunications policy and set a universal service fund, and the 2008 communications policy put telecommunications, broadcasting and post under one regulator. A review of the 2008 policy and the 2012 Act was tendered in 2025, with bids closing 21 July; no award is held.	NO CHANGE
Liberia	A licensing and spectrum reform package was announced in July 2026, splitting infrastructure and service licences and promising first satellite rules. It also carries tower-sharing rules, a device-identity regime and repatriation of the country-code domain; none has been published as an instrument (reform package). Licensing has otherwise run unchanged under a 2007 statute with no satellite or device rules, so the package would be the first structural change to the market's licensing in nineteen years.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Libya	The National Telecommunications and Informatics Strategy 2023-2027 remains in force, with root servers delivered under it in October 2025. The strategy period runs to 2027 and nothing on file records a mid-term review, a successor or a costing. Its one recorded delivery is the pair of root-server instances that entered service in Tripoli and Benghazi in October 2025, presented by the authority as a step in national control of internet infrastructure (root servers).	NO CHANGE
Madagascar	The digital strategy was independently assessed for the first time in December 2025, and a cybersecurity strategy entered drafting. A United Nations development agency assessment of the national digital strategy was completed in December 2025 and formally handed to government, finding leadership and strategy in place and implementation reporting absent (assessment, handover). Drafting of a national cybersecurity strategy was launched in the same month, intended to replace a cybersecurity law of 2014 (launch). A June 2026 monitoring session on the two World Bank digital projects reported one on work plan and the other in its closing stage, with no new figures (review). The strategy's own text on the ministry's site remains unreachable, so the repository holds an assessment of it rather than the document.	MOVEMENT
Malawi	The digitalisation policy is in force and its delivery vehicle completed the national data centre; a successor strategy is at validation. The standing instrument is the Digitalisation Policy 2023-2028, which the government's own open-government action plan records cabinet as having adopted and operationalised. 2025-10 - the acceleration project completed the Lilongwe national data centre and began first-client migration, at 19 per cent disbursement. 2025-11 - the mid-year fiscal statement named digitalisation among the priority sectors of the national economic recovery plan. The successor is not adopted: a draft national digital transformation strategy went through validation and remains pre-adoption, with no adoption date on record. The 2013 national ICT policy set ten priority areas and pledged universal ICT access by 2016. No repeal is held.	MOVEMENT
Mali	The national digital economy strategy ran to 2020 and nothing has replaced it on the record; the policy documents behind it were approved by decree in 2016. The strategy was drafted in November 2014 by the digital economy ministry and the document held is a draft (strategy); decree n. 2016-0066/P-RM approved the national policy documents (decree). Six years past its horizon the repository holds no successor, no implementation report and no evaluation. What has moved instead is institutional: an agency board setting strategic orientations and a national Digital Week whose recommendations went to the Council of Ministers (week).	STALLED
Mauritania	The national digital transformation agenda for 2022-2025 has run out, and preparation of a 2030 successor began in December 2025. The 2022 agenda is now held as the ministry's own document, carrying a vision, objectives, strategic orientations, implementation levers and project sheets (agenda). The ministry announced on 4 December 2025 that work on a National Digital Transformation Agenda 2030 had begun (successor). No implementation report, budget outturn or project-by-project status against the 2022 agenda's sheets is published, so a four-year strategy closed without the repository holding what it delivered.	MOVEMENT the strategy period expired with a successor only in preparation
Mauritius	The 2025-2029 digital transformation blueprint sits under a 2030 strategic plan, with a national data strategy added in 2026. The long-horizon instrument is the 2030 strategic plan of December 2018 (plan); the blueprint of May 2025 is the current term's programme under it (blueprint). A national data strategy for 2025 to 2029 was published in January 2026, the first instrument to revisit the 2017 open data policy (strategy). The repository holds three live strategy instruments and no published measurement against any of them. The one progress account on file is the digital government transformation strategy's own update of April 2025 (update).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Morocco	Digital Morocco 2030 is the standing strategy, launched by the ministry in September 2024. The ministry's own launch page is the primary record of the strategy the ledger carries, and no successor or revision has been published. What has moved under it is delivery rather than doctrine: a simplification drive that has digitised more than 2,700 procedures and cut paperwork by 45 per cent in pilot zones, and the interoperability platform recorded live in August 2025 with its binding legal framework still pending.	NO CHANGE
Mozambique	The ICT institute launched the process of drafting a National Digital Transformation Strategy on 12 February 2026, successor to the 2019-2028 information-society plan. 2026-02-12 — the national ICT institute opened the process of drafting a National Digital Transformation Strategy for sustainable and inclusive development, the announced successor to the Strategic Plan for the Information Society 2019-2028. What moved is a drafting process, not an instrument: no text, adoption date or budget is published, and the 2019-2028 plan remains the operative strategy until one is. The repository holds no delivery report against that plan either, so the succession is being begun without a published account of what it achieved. 2026-09-22 - a civil-society review cites the plan as Resolution 52/2019, under the 2018 Information Society Policy, and finds its execution hampered by limited consolidated public reporting and dependence on donor cycles. The information society policy was approved on 20 March 2018 on seven axes, revoking the 2000 informatics policy.	MOVEMENT a successor strategy entered drafting with the 2019-2028 plan still the operative instrument
Namibia	A National Digital Strategy was launched in August 2025 and the ICT ministry's five-year plan in January 2026. The minister launched the National Digital Strategy together with a National Emergency Telecommunications Plan on 5 August 2025, as the framework for the country's digital transformation (launch). The ministry's own strategic plan for 2025 to 2030 was launched regionally at Opuwo in January 2026, its priorities affordable broadband and mobile coverage in rural and underserved areas, cybersecurity, data protection and electronic government (plan). The national data centre the digital strategy calls for was still at concept-note stage a month after the strategy launched, and is now a flagship project inside a N$639.2 million ICT budget for 2026/27 (budget). Two strategies and a plan in eighteen months; what the repository does not hold is a delivery measure against any of them.	MOVEMENT
Niger	The 2021-2030 digital policy remains the reference framework, with a successor for 2026-2035 through validation and not yet adopted. The ministry confirmed in May 2026 that the 2021-2030 national digital policy remains the operative reference framework and that the new household survey of access to information technology will be used to update it. The successor draft was handed to the minister on 13 October 2025 after roughly two months of drafting, with implementation to follow only after adoption, and went to a national validation workshop in March 2026 on three strategic axes. The successor has not been formally adopted, so the repository holds two instruments — one operative and dated 2021, one drafted and unadopted. A national digital agriculture strategy adopted in October 2022 carries six axes, 19 programmes and 71 actions, with 22 projects across 37 prioritised actions in its 2023-2027 plan (strategy, summary). No implementation reporting against it is held. The sector policy the present one succeeds was adopted by decree in 2013 for the period to 2020; a civil-society study sets out what it delivered.	MOVEMENT
Nigeria	The National Telecommunications Policy is being rewritten for the first time since 2000, a licensing regime built for voice and messaging. The rewrite was under way in May 2026 (rewrite). A licensing regime built for voice and short messaging is cited as a reason hyperscalers route investment to other African markets, which is the argument the rewrite has to answer. No draft, timetable or consultation is published. 2026-09-18 — the president declared the digital free zones initiative moved to its implementation stage, with one zone licensed, the stated aim being that technology and service companies raise global capital and serve international markets without incorporating or holding intellectual property abroad. The declaration came through an adviser's release rather than an instrument, and carries no zone count, investment figure or timetable.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Rwanda	An ICT sector strategic plan covering 2024/25 to 2028/29 replaced the 2018 to 2024 plan, and only a front-matter extract is held. The plan is the standing sector instrument and the repository holds a front-matter extract rather than the body, so the artefact is the record and its targets cannot be quoted against outturn (plan). It is also what dates the data centre and cloud directives, which carry no date of their own. A strategy whose text the repository cannot read is a limit on every judgement in this report about whether delivery is on plan.	NO CHANGE
Sao Tome and Principe	A revision of the regulatory framework covering the regulatory entities law and the electronic communications law was approved by the Council of Ministers and sent to the National Assembly. The regulator's own statute was already approved, and the two laws went to the Assembly in 2025; no later source confirms parliamentary passage (revision). The 2020 digital governance strategy remains the framing instrument, on nine thematic axes (strategy), and a published national data strategy joined it in July 2025 (data strategy). What is missing is the sector instrument between them: no ICT or broadband plan with targets, costings or a delivery timetable is held, and the two bills have sat with the legislature for a year with nothing published about their progress.	MOVEMENT
Senegal	The President instructed an evaluation of the technology strategy's programmes in June 2026, sixteen months after its launch. In Council on 17 June 2026 the President, citing the strategy he launched on 24 February 2025, instructed the minister to evaluate with sector actors the state of progress of the digital programmes, projects and reforms, insisted on universal internet access and on sovereign securing of data and critical systems, and instructed the Prime Minister to convene the digital council regularly. The same council adopted the critical information infrastructure bill. The strategy itself runs to 2034 on four axes through a ten-year master plan of 12 priority programmes and 50 priority projects, costed at 1,105 billion FCFA of which 950 billion identified, and targets of 95% quality connectivity, more than 90% of Senegalese with a digital identity and 100% of sensitive data hosted in Senegal. It is explicit about why it exists: its predecessor achieved 19% strategy realisation and 12% execution across 69 projects, attributed to weak governance, siloed systems and unrationalised investment. The prime minister's general policy statement of 8 September 2026 refocused the programme on a sovereign cloud for the state's sensitive data and an accelerated sectoral AI strategy, narrowing selection to initiatives that are feasible, financed and able to produce measurable results (statement).	MOVEMENT
Seychelles	The National ICT Policy of 2007 is still the standing whole-of-government instrument, with no successor, revision or evaluation held. The policy covers ICT infrastructure, the legal and regulatory framework, human resources, industry and government (policy); the document carries no date on its face and 2007 comes from a third-party policy portal. Delivery has continued without it: the official citizen portal was relaunched in June 2026, timed to the fiftieth anniversary of independence (portal). Nineteen years on, nothing held records the policy being reviewed, costed or replaced, so what governs ICT strategy is an instrument older than the smartphone.	MOVEMENT
Sierra Leone	The Digital Development Policy 2021 is the sector policy, and an open-source software first policy was approved by Cabinet in July 2026. The sector policy was issued in 2021 as the ministry's own instrument (policy). Government ICT officers and digital leads validated a first open-source software policy for the public sector at a workshop in November 2025 (validation), and Cabinet announced its approval in July 2026 (approval). No implementation guidance or compliance route under either instrument is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Somalia	The 2019-2024 policy has expired and a successor went to national consultation in October 2025 without being adopted. The first cross-cutting national ICT policy and strategy, adopted by Cabinet for 2019 to 2024, documented five major mobile operators employing about 25,000 people and mobile money at 150 million transactions a month (policy). It has expired. A two-day multi-stakeholder workshop opened in October 2025 to validate a successor Digital Transformation Strategy for 2025 to 2030 (consultation). As of the last record the repository holds, that successor remains at validation stage rather than adopted, so the country has been without a current ICT strategy since the end of 2024. 2025-11 — a consultancy to renew the expired ICT policy for 2025-2029 was called, with expressions of interest due 29 November 2025, although the minister had said in July that a national ICT policy was approved earlier in the year.	MOVEMENT
South Africa	The communications department tendered on 11 August 2026 for an ICT indicators and scenario-modelling system to steer the digital economy to 2050; nothing is awarded or built. 2026-08-11 — the department put out to tender a system of ICT indicators and scenario modelling running to 2050, framed against the National Digital Transformation Roadmap, the Presidential Commission on the Fourth Industrial Revolution and the Digital Economy Masterplan. What is tendered is the instrumentation, not the strategy: no award, value or delivery date is published, and the three documents it is framed against are the standing position it would measure. A second monitoring instrument appeared in the same month — the Presidency and the planning department went to the parliamentary committee to fast-track a digital dashboard for mega infrastructure projects, again with no delivery date, data source or custodian named, and no statement of whether it will be public.	MOVEMENT a tender for a modelling system rather than a strategy
South Sudan	The National ICT Policy 2012 is still the standing sector instrument, fourteen years on. The policy covers telecommunications, postal and information technology, and is corroborated as current by the universal service fund's own pages and by a 2022 country diagnostic (policy). The nearest thing to a newer directive is a regulator's circular of April 2026 requiring its licensees to integrate with a single national service platform (circular). No review, successor or delivery report against the 2012 policy appears anywhere in the repository.	NO CHANGE
Sudan	The last information and communication technology strategy the repository holds ran to 2011, and the e-government plan that followed it expired in 2020. The Knowledge Society strategy approved in 2007 under the twenty-five-year national strategy ran to 2011, with the National Center for Strategic Planning named as the responsible body (profile). The e-government and smart transition plan that followed covered 2016 to 2020 and has expired; its text could not be captured (plan). The repository holds no successor. What the minister described to the ITU in November 2025 is a programme of work — digitising services, updating regulatory frameworks, developing digital identity and cybersecurity — not a published strategy (statement).	NO CHANGE
Tanzania	The 2016 policy is still the standing instrument, with a successor infrastructure plan out for consultation. The 2016 national policy, revising the 2003 one, is the operative standing instrument; a 2023 draft successor went out for stakeholder review and no evidence of its enactment was located. A ministry consultation in March 2026 opened a new national infrastructure development and construction plan with an accompanying construction guideline. The 2026/27 ministry budget of 222.589 billion shillings sets eight priorities including backbone strengthening, technology parks and rural connectivity. The money and the plans are moving; the policy under them has not been replaced in ten years.	NO CHANGE a ten-year-old policy with an unenacted successor
Togo	The electronic communications and posts regulator was created in October 2020 in an institutional reform replacing its predecessor. The creation date is held at month precision, and a claim that the country's framework is a model for other African markets is the publisher's and uncorroborated (regulator, broadband). The regulator is the most active institution in this ledger — it runs the frequency plan, the fee decrees, the consumer tour and the quality regime — and no annual report, budget or enforcement series for it is held. The digital-economy sector policy for 2018-2022, on four axes, was approved by decree in the Council of Ministers in October 2017. Its term has ended.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Tunisia	The ministry's 2025 performance plan names a national digital strategy as its operative framework; that strategy has since lapsed at term. The ministry's 2025 annual performance plan names a National Digital Strategy 2021-2025 as its operative framework and anchors it in Vision 2035 and the 2023-2025 development plan. That strategy lapsed at the end of 2025 with no extension, repeal or outcomes report, so what it delivered against its own objectives is unestablished, and what replaced it is a chapter of the five-year development plan rather than a sectoral strategy. The plan dates the strategy 2021-2025 where other sources in this repository give 2020-2025, and nothing reconciles the two.	NO CHANGE the framework the plan names is the one that has since lapsed
Uganda	The 2022 Digital Uganda Vision to 2040 is the standing frame, and both the ICT ministry and the IT authority launched five-year plans written to align to it. 2025-10 - the ICT ministry launched a Five-Year Strategic Plan for FY2025/26 to FY2029/30 with Service Delivery Standards, on a programme-based approach to planning and budgeting. Neither document is held and the account states no quantified target. 2026-06 - the IT authority launched its own plan for the same period, with the proportion of Ugandans actively using e-government services to go from 9.2 per cent to 40 per cent by FY2029/30 across six objectives, reported against quarterly. The frame itself has not moved: the 2022 Vision is unchanged and unreplaced, and sets a 2040 horizon with no dated quantitative target behind it. What the repository does not hold is either plan's text, so the targets reach this report through launch accounts. The 2014 national ICT policy replaced the 2003 framework and set targets for 2020. A final draft revising it on eight focus areas was prepared for the ministry in 2022; no adopted successor is held.	MOVEMENT
Zambia	The 2023 ICT policy is in force, with towers reported growing from 3,568 to 3,751 and coverage at 95 per cent. The National Information and Communication Technology Policy 2023 is the overarching instrument, revising the 2006 policy. 2026-04 — an official progress statement reported towers growing from 3,568 in 2023 to 3,751 in 2025, average mobile population coverage of 95 per cent, and 14.7 million internet subscriptions in 2025. The figures are the delivery unit's own and they measure infrastructure rather than policy delivery: no target from the policy is quoted, and no evaluation of it as an instrument is held. Procurement of bulk international bandwidth for the government network is the one implementing step in the window.	MOVEMENT
Zimbabwe	The National ICT Policy 2022-2027 states no adoption or publication date anywhere in its text, and a Smart Zimbabwe 2030 master plan carries no publication date, foreword date or gazette reference. The ICT policy is the operative published national instrument, distinct from a still-unpublished 2026-2030 policy named in passing elsewhere; its year is padded from its own title (policy). The master plan builds on a 2016-2020 policy and a continental manifesto, and its year is padded from its own end-2018 baseline data (master plan). Two undated national instruments, both dated here by inference from their own contents, is the documentary base under everything in this unit. A Postal and Courier Services Policy is being drafted (September 2026), with no text published.	NO CHANGE

Broadband strategy

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The fibre programme is targeted for completion in 2027, with a universal-service tender for underserved areas in September 2026. There is no standalone broadband strategy document; the target is stated by the minister and delivered by programme. Fibre completion is set for 2027 under the fixed broadband and fibre-to-the-home programme, with new fourth-generation base stations planned and a 400G optical backbone project launched with Huawei. Coverage of underserved areas was put to the market in the window: a universal-service tender for mobile coverage of 3,000 low-density localities in September 2026, whose calendar, fixed by ministerial order, gives operators 45 days to bid and the regulator 30 days to publish results. International capacity remains measured but unpublished as a target. 2026-10-01 - the posts ministry said Algiers ranked first in Africa and 34th of 50 cities in a 2026 gigabit-city index, a first measurement.	MOVEMENT
Angola	No standalone broadband strategy. Broadband sits inside the sector white paper, with the national broadband network as the delivery vehicle. There is no separate broadband policy, plan or target document. What governs broadband is the sector white paper for 2023-2027, and what delivers it is a financed construction project: the national broadband infrastructure upgrading programme, whose appropriation the 2026 budget cut. The measured position is published by the regulator rather than by a strategy: 55.5 per cent of individuals using the internet in 2024, 12,785,472 broadband subscriptions at 36.4 per cent penetration, and population coverage of 77.41 per cent at fourth generation and 16.4 per cent at fifth. Nothing states a target those figures are measured against.	NO CHANGE
Benin	The broadband programme was founded by decree in 2015 and the Cotonou declaration was adopted in November 2025. No separate broadband strategy is adopted. The 2015 decree authorising the broadband infrastructure loan is the founding instrument and it is a financing and works programme rather than a strategy. 2025-11-18 — the Cotonou declaration was adopted. What the repository does not hold at either end of the period is a broadband strategy document with targets against it.	MOVEMENT
Botswana	The 2018 National Broadband Strategy is unrevised, but its funding and its service-quality machinery both moved this year. 2025-09-01 — a framework formalised the levy funding the strategy's universal-access arm and set the fund's governance and categories of intervention. 2026-04-01 — service-quality guidelines came into force for licensed communications operators, the first enforceable nationwide quality regime the repository holds. The strategy itself has not been revised since June 2018 and no successor is on the record.	MOVEMENT on the machinery around the strategy rather than the strategy
Burkina Faso	The national digital development master plan was adopted by decree on 3 July 2019 with a 2030 affordable-broadband vision and operationalised on 24 October 2025 as a mapping platform. The plan is the medium and long-term national broadband and digital-infrastructure planning instrument, adopted by decree in council on 3 July 2019. No coverage target inside it has a published measurement against it. 2025-10-24 - a geographic information platform built from the plan was launched to map infrastructure and coordinate investment, and the observatory behind it runs eight functional objectives covering network mapping, infrastructure sharing and reduction of duplicate investment. 2026-09 - the plan itself is being revised to a 2030 horizon to narrow the divide, so the instrument in force is one the authorities have said is out of date.	MOVEMENT
Burundi	A national broadband strategy was validated in 2017 and was still awaiting government adoption in early 2018, while a broadband mapping project was launched in late 2025. Burundi Large Bande 2025 was drawn up with technical-union support and validated by stakeholders on 6 December 2017, and was still awaiting government adoption. No published full text and no adopting act were located, so a strategy named after a year that has now passed has never been in force. 2025-10-28 to 30 — a national event launched a broadband mapping project, to identify underserved areas, direct investment and support an operational roadmap. Mapping where coverage is absent is the input a broadband strategy would use; the strategy it would feed is the one that has not been adopted.	MIXED a strategy still unadopted while a mapping project was launched

COUNTRY	DEVELOPMENTS	PROGRESS
Cameroon	The only broadband strategy is the 2016 plan, whose first strategic axis was broadband infrastructure and whose validity expired; procurement runs without one, 362 rural localities out to tender. The instrument is a decade old and lapsed: the ministry's own page makes broadband infrastructure development the plan's first strategic axis, and its five-year validity has expired with the successor still in preparation. 2025-11-06 - the delivery is proceeding anyway. An internationally competitive tender covers supply, installation and commissioning of mobile broadband equipment across 362 rural localities in two tranches, financed by a World Bank credit. 2025-10-03 - a companion notice seeks a consultant to survey existing provision and specify bandwidth for connecting public entities, naming rural local authorities, hospitals, primary schools, secondary and teacher-training schools, vocational centres, women and family promotion centres and centres for disadvantaged persons. Neither is a strategy: both are components of one financed project, and no national target, coverage figure or timetable sits above them.	MOVEMENT
Cape Verde	A national 5G strategy was approved by resolution on 20 February 2026, targeting 90% internet penetration by 2026. The strategy was presented as a proposal at the technology park on 10 September 2025 under a World Bank-financed project and approved by resolution on 20 February 2026, targeting 90% internet penetration by 2026 and regional digital-hub status by 2030, with the economic impact put by government at more than CVE 77 billion by 2036. No spectrum assignment, licence award or network build is on file. The penetration target cannot be tested against the regulator's own series: its first-quarter 2026 report counts 511,702 internet subscriptions and 113.9% mobile penetration, and states no internet penetration rate.	MOVEMENT
Central African Republic	An investment programme states a target of 3,000 km of fibre-optic deployment; no broadband plan is held. 2025-09-04 - a US$12.8bn investment programme tied to the national development plan states an explicit national target of 3,000 km of fibre-optic deployment. It is a target inside an investment programme, not a broadband strategy: no coverage objective, no timetable, no financing close and no kilometre built under it is recorded. It sits against a standing twelve-thousand-kilometre fibre commitment this ledger already carries, which is four times larger and equally unbuilt.	NO CHANGE a first stated position with no earlier account behind it
Chad	There is no standalone broadband strategy; Tchad Connexion 2030 carries the targets, and two-thirds of its funding was pledged in November 2025. The national development plan is the operative instrument, setting 80 per cent internet coverage and privatisation of the state operator by 2030 against a 30 billion dollar envelope (plan). A financing round table in Abu Dhabi closed with 20.5 billion dollars of the 30 billion ask pledged (round table); the figure is multisectoral, not a broadband envelope. The monitoring architecture for the plan was installed on 9 December 2025 (framework). So the coverage target has a plan, a monitoring body and a pledge total, and no published broadband allocation inside any of them. 2026-09-08 - US$790.5m of the US$20.5bn pledged, 3.9%, is signed across seventeen companies.	MOVEMENT
Comoros	No broadband strategy is on file; the connectivity project is still at feasibility-study funding and the regulator measures coverage rather than plans it. The repository holds no broadband plan, target or coverage obligation at either end of the window. What stands in its place is a project and a measurement. 2026-02 - the regulator's two-month control across the three islands measured twenty-two indicators and left Comores Telecom with eight to improve on Grande Comore, twelve on Anjouan and ten on Moheli, and Yas with eleven and fourteen. 2026-08 - two development banks told the finance ministry they were ready to fund feasibility studies for inter-island connectivity as a grant, with no amount or timetable stated. A quality control is not a strategy: nothing on file sets a speed, a coverage target or a date.	NO CHANGE
Congo	The state operator received transferred network assets by decree in June 2026. No broadband strategy document is adopted. 2026-06-18 — a decree transferred network assets to the state operator. The standing policy instrument is the national digital economy strategy; nothing at either end of the period is a broadband strategy with targets against it, and the movement here is an asset transfer rather than a plan.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cote d'Ivoire	The universal-service agency presented a 2026-2030 plan targeting 300 newly connected localities and more than 15,000 km of national backbone fibre lit. 2026-08-11 - the agency's director general set out a plan on four pillars across ten projects, four followed by the supervising ministry at FCFA 60.144bn and six on the agency's own funds, targeting 300 newly connected localities, smartphone penetration of 80% by 2028 against 40% now, and more than 15,000 km of national backbone fibre lit by 2028, against a starting point of 70% of rural households with no internet access. No adoption instrument is published: the plan is the agency's own rather than a government strategy, and nothing states how the six self-funded projects are to be paid for out of a levy whose accounts are unpublished.	MOVEMENT
Djibouti	A broadband strategy is in place and the universal service fund it names reached draft decree in April 2026. The Strategie Nationale du Haut-Debit was presented in 2024, aligned to Vision 2035 and weighing two coverage scenarios - seven or ten towns by 2027 - with the north served by radio links against optical backbones in the south. No enacting decree for it is held. 2026-04-20 - a regulator and ministry meeting on a World Bank mission's final report produced a draft decree, an internal bylaw and an operations guide for a Universal Service Fund, the financing mechanism the strategy names for underserved areas. The fund itself is not yet constituted. 2025-11-09 - the regulator and the telecommunications union held a two-day workshop on spectrum strategy, pricing, licensing and sharing, whose recommendations are to found a National Spectrum Management Plan. No plan has been adopted.	MOVEMENT
DR Congo	A National Connectivity Strategy 2026-2035 was published with a target of 3,000 localities and 16 million people by 2030. 2026-08-13 - the strategy was published on a shared-infrastructure model led by a tower company, with subsidy agreements signed with the four mobile operators to extend service to 40 underserved localities covering about 258,000 people, against a target of 3,000 localities and 16 million people by 2030. The fund publishes its selection framework: a 100-point priority index weighting strategic class 30, coverage deficit 20, population density 15, public infrastructure 15, local economic potential 10 and feasibility 10, with localities above 60 points classed for immediate deployment, subsidy confined to sites where an operator shows a negative return over four years, and national roaming imposed on sites above 70. The strategy text is not held, and the index did not select the first 40 localities. 2026-09-09 - studies on infrastructure sharing, national roaming and telecom taxation were presented, recommending lower equipment duties and a central infrastructure database.	MOVEMENT
Egypt	A 2026-2030 spectrum strategy accompanied a US$3.5bn award of 410 MHz to the four operators, doubling their holdings. Neither existed at the window's opening. 410 MHz of additional spectrum was awarded to the four operators for US$3.5bn, doubling operator holdings in a single transaction, the minister stating the award matches all spectrum allocated in the country over the previous thirty years, across 1.8 GHz, 2.6 GHz and 3.5 GHz. The strategy document is not held. The country refarmed 2.6 GHz for fifth-generation service rather than licensing dedicated mid-band, and set no coverage or speed obligations comparable to its neighbours' - so the largest spectrum transaction on this ledger carries no published obligation on what the operators must deliver with it. Investment since 2019 is stated at more than US$6bn, with about 3,000 new towers planned in-year and a stated target of 40,000 by 2028, in dollars by the ministry and with no split between state and operator spending given.	MOVEMENT
Equatorial Guinea	The transport ministry set the country's first published target: 85 per cent coverage through 34 new towers by end-2026. Equatorial Guinea has had a fibre backbone since the last decade — four rings and an international gateway, over US$30m invested — and no coverage target against it. The half-year plan of July 2026 supplies one: 85 per cent second and fourth generation coverage through 34 new towers by the end of the year. Twenty of those towers were already live on the mainland trunk road by September 2025.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	The telecommunications union's own survey of national plans records the country as having none. Nothing later on the repository records one being adopted. The absence is documented rather than merely unfound. The telecommunications union's survey of broadband strategies, policies and plans carries the country in its table with no plan against it; neighbouring entries in the same table carry theirs, so the reading is unambiguous. What governs the sector instead is the communications proclamation of 1998, which makes the ministry's communications department sole regulator and sets the development of national communications capability as an objective without setting a target for it. Nothing published since names a broadband target, a coverage obligation or a date.	NO CHANGE
Eswatini	The regulator's universal access strategy for 2018-2021 is the only broadband instrument held, and it awaited a National Broadband Plan that never arrives on this repository. The strategy states that national broadband targets awaited a separate National Broadband Plan and Strategy, and substituted SADC targets in the meantime; its period expired in 2021 and no renewal is held (strategy). The regulator moved on the baseline instead. It proposed on 16 July 2026 to raise the minimum guaranteed internet speed from 2 Mbps to 10 Mbps, open for comment to 18 August 2026 (notice). The 2 Mbps target it would replace has stood in the quality-of-service regulations since 2016. What the repository holds is regulation without a plan behind it: a proposed speed floor, a national backbone under rollout, and no published national broadband target at any date.	NO CHANGE the one broadband strategy expired in 2021 with no renewal held
Ethiopia	A government-commissioned assessment recommended a broadband plan be developed; none has been established since (assessment). The 2023 e-government assessment commissioned by the innovation and technology ministry recommended that a broadband plan be developed to guide infrastructure deployment (assessment). No such plan was located at the probe date of 28 August 2026. What moved sits alongside it. The Council of Ministers approved Digital Ethiopia 2030 in November 2025, which commits to nationwide high-speed broadband as part of the successor national digital strategy (approval). Ethiopia's broadband mapping system was introduced at a national event in October 2025, bringing the Economic Commission for Africa, the EU delegation and the ITU together to build the infrastructure evidence base for future broadband policy (event). A commitment inside a general strategy and a mapping tool are not a broadband strategy, and the repository does not treat them as one.	NO CHANGE the recommended broadband plan is still not held and what moved sits alongside it
Gabon	A satellite and space seminar adopted eleven recommendations in July 2026 and confirmed a hybrid fibre-and-satellite model, without drafting the strategy. The Libreville seminar closed with eleven recommendations and confirmation of a hybrid model combining fibre and satellite, and recommended an integrated national strategy rather than producing one (seminar recommendations). No delivery date, budget line or drafting owner is named (seminar account), and the repository holds no broadband plan, coverage target or national digital strategy document of any kind.	MOVEMENT
Gambia	The 2020-2024 broadband policy and strategy expired at the end of 2024 and no successor was located. The strategy behind the policy was costed action plan by action plan and targeted 5 Mbps for all, 90 per cent coverage and 85 per cent fourth-generation coverage by 2024. The policy itself is held with its capture truncated. The term has ended and no successor instrument is on the record. What is moving is procurement rather than policy: a US$50m partnership signed in December 2025 is to lift the national backbone from 40 to 800 Gbps.	REGRESSED

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	A 5G spectrum award is under way on eleven lots and a US$230m reserve, with assignment and deployment stated for December 2026 against a 70 per cent coverage target for 2028. Its rural schedule was rewritten to fixed dates so that buying spectrum does not accelerate an existing commitment: 40 per cent of the rural population by December 2029 and 80 per cent by December 2035. The ministry separately projects 70 per cent coverage by the end of 2028, with assignment and deployment stated for December 2026. 2026-09-09 - four applications were received by the deadline, three qualified, and the 700 MHz lots went to the dominant operator as sole qualified applicant for US$100.9m. 2026-09-17 — at the second stage the second operator took all three of the 2.3 GHz lots it applied for, of five made available. Neither assignment date nor licence fee is stated, and the regulator announced no outcome (award). 2026-10-02 - the dominant operator announced the regulator's notice of award of 700 MHz and 3 GHz spectrum for US$202m in all, to be deployed for 5G once the licences issue.	MOVEMENT
Guinea	Fibre-to-the-home is restricted and shared-Wi-Fi activity barred, contested by the telecoms union with a strike threat. The union threatened to strike on 21 May 2026 over the restriction and the shared-Wi-Fi regime (dispute). The regulator had confiscated unlicensed equipment from resellers following a communique of 30 March 2026, which predates the dispute on the record (enforcement). No broadband plan, coverage target or licensing decision resolving either question is held, so access policy reaches the repository as a licensing dispute rather than as a strategy.	REGRESSED
Guinea-Bissau	A 2026-2031 strategic plan for the universal access fund sets targets for closing the coverage gap. A legal review recommended restructuring the universal access fund in October 2025, which is the repository's judgement on the instrument as it stood. The 2026-2031 roadmap and financing plan followed in November and was delivered to the regulator in May 2026. It is a fund plan rather than a broadband strategy, and it is the nearest thing the country holds to one.	MOVEMENT
Kenya	Against a target of 100,000km of fibre, 37,000km was installed as at September 2026, leaving 63,000km outstanding before the 2027 deadline. The ICT Cabinet Secretary gave the installed figure against a target serving 53,000 government facilities. The programme was announced in November 2022 and split in 2023 into 52,000km for government and 48,000km for private companies, with Sh940.6m paid to the power utility by June 2025 for design, supply and installation (programme). FY2026/27 carries KSh 1.3bn for backbone maintenance and KSh 528m for last-mile county connectivity (allocations). The repository holds no independent verification of the 37,000km and no route or county breakdown behind it. 2026-09-04 - coordination was stepped up rather than the schedule revised: two principal secretaries began co-chairing a standing review of the implementing agencies, framed against taking the technology industry from US$7bn to US$100bn. No revised delivery date accompanied it.	MOVEMENT 63,000km short with months to the deadline
Lesotho	A Broadband Infrastructure Sharing Policy was signed by the communications minister in June 2026, with no implementation instrument on record. The minister signed the policy on 12 June 2026, one of three digital policies signed together (signing). The text itself is not held, so its obligations on licensees cannot be stated. The 2025/26 budget speech had recorded the drafts as validated, and no regulator guidance under the signed policy has been published since (budget speech).	MOVEMENT
Liberia	No separately titled broadband strategy; the January 2026 infrastructure roadmap commits the ministry and the regulator to one in years 2-4. The broadband and universal-access targets sat in the National ICT Policy 2019-2024, whose stated period expired in 2024 and which the repository holds no successor to. The 2026-2029 roadmap adopted after the national infrastructure conference of 19-23 January 2026 places a national broadband expansion plan in years 2-4, which is a commitment to draft rather than a plan. The repository holds no costing, no coverage target and no delivery schedule for that plan.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Libya	The 2025-2030 digital agenda sets a broadband rollout to 2027 and records the laws behind it as unenacted. The agenda issued in October 2025 is the first standing digital development plan the repository holds for Libya, and it puts broadband rollout on a horizon to 2027 while stating that the data protection and electronic commerce laws it relies on remain unenacted. What is moving underneath it is wholesale access rather than a plan: the regulator and the fixed operator set fibre-pair lease prices and opened access networks to private investment in December 2025. 2026-09-28 - the telecoms authority and the ITU opened a review of the national emergency telecommunications plan and early-warning systems, conceived after the 2023 Derna flood cut communications; no draft is on record.	MOVEMENT
Madagascar	No standalone broadband strategy is held; delivery runs through a donor project whose ministry's financial governance was criticised by the audit court. The supreme audit institution examined the digital ministry's financial governance and asset management for 2022 to 2025, criticising its handling of the ICT development fund and of two flagship projects (audit). Parliament called in July 2026 for faster network rollout in underserved areas (call). The repository holds no broadband plan, coverage target or universal service obligation as a document. What stands in its place is a project restructuring paper targeting enhanced broadband for 1,500 schools and health centres by March 2028 (restructuring).	NO CHANGE
Malawi	Spectrum licence fees were cut by 20 per cent and the regulator is building a harmonised national broadband map under a regional project. The reduction across all bands followed review of the regulator's 2016 incentive pricing model; no fee schedule, gazette notice or statutory instrument is held, so the base amounts and the effective date are unknown (reduction, account). The minister told Parliament in July 2026 that the cut was 50 per cent (reduction); five contemporaneous accounts say 20 and no source records a second reduction (parliament). The regulator hosted a five-day training at Lilongwe in August 2026 for broadband-mapping practitioners from four countries, under a 2025-2028 project to establish harmonised national broadband mapping in eleven sub-Saharan regulators (mapping). The mapping system itself launched on 7 October 2025 with regulator, telecommunications-union and European Union support, against 4G coverage of 75 per cent and 18 per cent of the population actively using the internet in 2023 (launch). No map, dataset or publication address for it is held, so what it has produced is not established.	MOVEMENT
Mali	Universal connectivity is targeted for 2030 on a roadmap drafted with two neighbours, and an updated access strategy with a white-zone map was recommended. The target was set at the national digital week's opening panel on 30 July 2026, with a roadmap drafted alongside Burkina Faso and Niger (target). The same week recommended an updated universal-access strategy carrying a white-zone map, which the repository records as not existing (recommendation, panel). Without that map, neither the target's distance nor its cost can be stated.	MOVEMENT
Mauritania	A broadband promotion and universal access strategy was completed in February 2019 with an action plan beside it, and no successor or implementation report is held. The strategy volume sets quantified coverage and capacity objectives, market segments and an indicative budget, and calls for a National Broadband Plan to be put in place; it proposes regulatory action on the wholesale market, a wholesale catalogue and a tariff structure (strategy, action plan). Seven years on, the repository holds no adoption instrument, no implementation report and no successor, and nothing establishes whether the National Broadband Plan it calls for was ever made.	STALLED
Mauritius	The broadband policy ran to 2020 and has no successor; what moves instead is spectrum, by regulator decision. The national broadband policy covers 2012 to 2020 and is the only broadband policy on file (policy). Six years past its horizon, the instruments actually moving broadband are the regulator's: the 700 MHz band opened for IMT and 5G in December 2025 (decision) and the 2300-2400 MHz band in June 2026 (decision). No replacement policy, coverage target or universal service obligation is held. The policy layer has fallen behind the licensing layer rather than directing it.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Morocco	The 5G licence specification carries the country's only published coverage commitments: a quarter of the population by end-2026 and 70 per cent by 2030. The regulator's own instruction report sets a coverage floor of eight cities plus airports by November 2025, 25 per cent of the population by the end of 2026 and 70 per cent by the end of 2030, on a maximum of three twenty-year renewable licences (instruction report). It corrects a conflicting figure held elsewhere in the repository. The bidders' own coverage commitments are not disclosed in the report, and no separate national broadband plan is held.	MOVEMENT
Mozambique	Internet Para Todos targets 80 per cent mobile penetration and 95 per cent territory coverage by 2030, and the President pledged 5G in all districts by then. The programme launched in March 2025 with the regulator stating targets of 80 per cent mobile penetration, 95 per cent territory coverage and 99 per cent network availability by 2030 (programme); two held accounts state those targets differently (programme, account). The President pledged 5G in provincial capitals, special economic zones and main tourist destinations by 2027 and in all districts and administrative posts by 2030 (pledge, coverage). No costing, financing plan or interim milestone is published for either. 2026-10-07 - a proposed Internet for All strategy with targets to 2030 was presented in Maputo, where only 15% of the population was said to afford mobile data. 2026-10-08 - the regulator put a proposed national Internet para Todos strategy to validation, with 2030 targets for internet use, digital skills and public access points. 2026-10-09 - the regulator validated the national Internet para Todos strategy, which targets 95% broadband coverage and at least 60% of schools connected by 2030.	MOVEMENT
Namibia	The National Broadband Policy of 2020 is the standing instrument, and the regulator consulted in 2025 on raising the minimum broadband speed. The policy was gazetted in August 2020 under the Communications Act and no revision or successor is held (policy). The regulator consulted on a proposed ministerial policy directive raising the minimum broadband speed, with the commenting period extended to 29 August 2025; no directive, speed figure or commencement has followed (consultation). Delivery runs through the universal service fund: the state fixed operator won a N$9,796,650 subsidy in April 2026 to deploy infrastructure at sites in underserved rural areas (agreement). The standing target is full telecommunications coverage by 2030, unchanged and with no later official coverage figure held. 2026-09-28 - the mobile operator was reported to hold a N$32.3m award under the fund's second phase for nine network solutions, including ten towers in underserved areas; no award date or site list is given.	MOVEMENT
Niger	The trans-Saharan backbone's steering committee adopted a 2026-2027 programme of over 30 billion FCFA; no standalone broadband strategy exists. Several fibre sections of the trans-Saharan backbone were provisionally received on 14 November 2025, presented as securing international internet access and interconnecting Niger with Algeria, Chad, Nigeria and Benin. The steering committee session of 13 March 2026 then adopted a 2026-2027 work programme and budget of over 30 billion FCFA, of which 16 billion is bank credit, 12.76 billion grant and 2.17 billion national counterpart. The minister's statement of 17 June 2026 sets the ambition — backbone modernisation from 100 to 800 Gbit/s, a near-complete national data centre and a second backbone phase of 3,500 to 4,000 additional kilometres. No standalone national broadband strategy instrument was located, so the ambition stands in place of one.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	The 2020-2025 broadband plan ended at 51.97 per cent penetration against a 70 per cent target; a Spectrum Roadmap 2026-2030 sets 2030 coverage targets and about 3,700 towers are to deploy from October 2026. The 2020-2025 plan ended with penetration at 51.97 per cent in December 2025 against a 70 per cent target, and 4G at 52.95 per cent of subscriptions against 70 targeted for 2023; no successor plan is on file. The roadmap targets at least 96 per cent 4G population coverage and at least 50 per cent for 5G by 2030, sets a median quality benchmark rising from 20-22 Mbps to 65-80 Mbps, and treats satellite direct-to-device as the complement for riverine, border and blackspot communities (roadmap); the universal service fund identifies 87 clusters holding approximately 23 million people (roadmap). Resource mobilisation and contracting are stated complete for about 3,700 towers reaching more than 20 million people, with a first tower in Delta State and riverine communities targeted before mid-2027 (towers); the count, the population figure and the dates are the government's own and no contract value or supplier is stated (towers, approval). The ministry said at least 200 of the 3,700 towers will be active by December 2026, with a new state satellite planned for places neither the towers nor the fibre programme reach. 2026-10-04 - the regulator's forum communique sets open-access and wholesale regulation within six to eighteen months.	MIXED the expired broadband plan missed its 70 per cent penetration target while a spectrum roadmap and a tower programme advance
Rwanda	The national broadband policy was revised in 2022, abandoning the single-wholesale-network model, and a phased legacy-network retirement plan now dates the third-generation sunset to June 2027. The revision abandoned the single-wholesale-network model the country had been known for (policy). Government approved a phased retirement plan for the older networks; in March 2026 the ministry had opened talks with device importers with no firm timeline, and the plan is what replaced that (plan, sunset). The third-generation switch-off is dated 30 June 2027 by the ministry, and the stated rationale is operator cost and spectrum rather than consumer benefit (third generation, phase-out). December 2028 is a working target for the second-generation switch-off, and a commissioned study puts more than two million people still on the older network in 2030 absent a planned transition (second generation).	MOVEMENT
Sao Tome and Principe	No broadband strategy is held; the only dated instrument in the window is the regulator's provisional authorisation of an IPTV service over the incumbent's platform. The regulator approved a resolution provisionally authorising the incumbent to carry IPTV over its own platform, stating the aim as developing and diversifying electronic communications services (authorisation). That is a service authorisation, not a plan for broadband coverage, targets or funding. No broadband strategy, national broadband plan or coverage target is published anywhere the repository reaches, and the universal service instrument that would carry one dates from 2012 (universal service).	NO CHANGE
Senegal	A universal connectivity initiative launched at Kédougou in February 2026 to connect a million people, delivered through a programme with 2028 targets. The President launched the initiative on 7 February 2026 as a national programme to connect one million Senegalese free of charge, with priority to areas where digital access was difficult or near non-existent, tied to the technology strategy. Its delivery vehicle carries the territorial targets: 1,550 localities covered with 4G as a minimum, 200 public structures equipped, five contents or applications developed and 500 people trained in digital trades, horizon 2028. No separately published national broadband plan was found; that plan belonged to the superseded 2025 strategy. The sharing question moved separately: the regulator closed proofs of concept on radio-access sharing and fibre unbundling on 4 June 2026, confirming both feasible under real conditions and published a synthesis of 21 contributions to its fibre consultation in August; no decision or obligation follows.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Seychelles	There is no standalone national broadband strategy; the closest instrument is the regulator's revised wireless-access spectrum policy of 2025. The revised policy governs licence-exempt use of the 2.4 and 5.8 GHz bands for fixed broadband wireless access, superseding the 2004 policy (policy). The connectivity targets a broadband strategy would carry sit instead in the universal access and universal service provisions of the Communications Act 2023, and nothing held sets a coverage or speed target under either.	NO CHANGE
Sierra Leone	A National Broadband Strategy 2023-2028 is published, above a spectrum framework that exists as a regulator's stated position rather than an instrument. The strategy was published by the ministry in October 2024, a year into the period it covers (strategy). The regulator set out its asks on spectrum pricing and management at an international congress in March 2026 (framework). That is a position, not an instrument: no consultation, draft or adopting decision follows it. The regulator does publish the operators' current network tariffs (tariffs). No target, milestone or delivery report under the broadband strategy is held, and its window closes in two years.	MOVEMENT
Somalia	No broadband strategy is held. A feasibility and security-risk consultancy launched in October 2025 to map infrastructure and design backbone routes. The ministry launched a technical feasibility study and security risk management consultancy under the regional digital project, mapping existing broadband infrastructure and designing backbone and cross-border routes (launch). That is design work, not a strategy: no coverage, speed or price target for the country is published anywhere the repository can reach. The regulator separately convened the first submarine cable technical working group in June 2026, on outage management, competition and the cable regulatory framework (workshop).	MOVEMENT
South Africa	The department tendered a market study toward a Cost to Communicate Roadmap, the regulator opened inquiries into telecoms cost and over-the-top services, and no auction is scheduled, priced or gazetted. 2026-08-01 — the department put a market analysis study out to tender, conceding a policy vacuum and that the price benefits expected from the 2022 spectrum auction remain largely unmet. 2026-07-24 — the regulator gazetted an IMT Roadmap to 2026 with draft assignment plans and opened consultation reaching to IMT-2030. The roadmap records 794 MHz assigned against 19,625 MHz identified. Against both, the release itself has not moved: the 2026 frequency plan targets 1,145 MHz more mid-band spectrum and over 17,250 MHz of mmWave, but no auction has been scheduled, priced or gazetted. A study of why prices are high and a roadmap of what could be assigned are both downstream of an auction nobody has dated. 2026-09-04 - the regulator gazetted two section 4B market inquiries, one into over-the-top services' impact on licensees and one into the affordability of voice and broadband for low-income, rural and informal users, each in four phases. Neither sets a date for findings. 2026-09-25 - the minister withdrew the 2019 reservation of high-demand spectrum for a wireless open access network that was never licensed; no auction is scheduled. 2026-09-30 - the regulator withdrew its affordability inquiry notice for republication with a draft questionnaire.	MIXED a cost study and a spectrum roadmap advanced while the release they depend on stayed unscheduled
South Sudan	A National Spectrum Management and 5G Strategy closed its inception workshop with methodology, work plan and governance structures agreed. The strategy is donor-financed through the regional digital integration project and consultant-led (strategy). No draft, spectrum award or timetable follows it. It is the only forward-looking connectivity instrument in this unit that is not a fibre route, and it is being written by external consultants inside a project the same lender finances.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sudan	No domestic broadband strategy is held. What moved is an ITU resolution creating a basis for international help to rebuild war-damaged networks. Sudan's draft resolution was adopted by consensus at the World Telecommunication Development Conference in Baku on 26 November 2025, seeking international support to rebuild war-damaged telecommunications infrastructure (adoption). The ministerial statement that preceded it names satellite connectivity for war-affected and remote areas as something to explore rather than a planned rollout (statement). Neither is a broadband strategy: they set a route to external assistance, not a domestic target for coverage, speed or price.	NO CHANGE
Tanzania	The 2021-2026 strategy's steering committee met for the first time in June 2026, in the strategy's final year. The ministry confirmed the 2021-2026 broadband strategy actively overseen at its steering committee's first meeting in June 2026, with the regulator reporting 94 per cent high-speed internet coverage and 35 per cent 5G access. A parliamentary committee inspected and confirmed the 758-tower project complete, with 304 towers upgraded to 4G and 5G under a 126 billion shilling programme. No primary text of the strategy is locatable, and a steering committee meeting for the first time in the strategy's final year is what the oversight record shows.	MOVEMENT
Togo	A decree approving the national frequency allocation plan was adopted in March 2026 and published by the regulator in April. The decree was adopted in Council of Ministers on 11 March 2026 and published on 15 April; the superseded 2022 decree is not held and carries no exact date in the repository (plan, royalties). A frequency allocation plan adopted and published is the most concrete piece of connectivity policy this unit produced in the period, and no assignment, auction or award has followed it on the record.	MOVEMENT
Tunisia	The regulator opened a second consultation on fibre infrastructure sharing in March 2026, on a strategy whose published terms of reference date from 2013. The ministry's very-high-speed broadband strategy is on the record through its own published terms of reference for a national fibre-to-the-home rollout, dated 2013. The regulator opened a second public consultation on sharing fibre access infrastructure from 6 March to 2 April 2026, after a first that ran from 26 September to 26 November 2025. A thirteen-year-old set of specifications is the newest broadband strategy document held. No coverage target, premises-passed series or take-up figure appears against it, and neither consultation's outcome is published.	MOVEMENT
Uganda	The 2018 National Broadband Policy was reviewed with the ITU in January 2026, and a fibre-deployment framework took effect the same month. 2026-01 - a review of the 2018 policy's implementation, prepared with the International Telecommunication Union, was published and proposes interventions, resting on a situation analysis of the sector's contribution to gross domestic product, mobile coverage, internet pricing, traffic and usage, and Uganda's placing in tracked international indices. 2026-01 - the regulator's framework on optical fibre installation, maintenance, protection and disposal took effect on 1 January 2026, setting minimum standards for deploying fibre infrastructure. 2022-04 - the ICT ministry published a broadband baseline survey and infrastructure blueprint costing a ten-year plan to 2032/33 at US$70m, fibre to every district capital first and subsidised radio sites from year six; its foreword says it is not a statement of government policy, and nothing records its adoption. The repository holds neither the review's findings nor its proposed interventions in itemised form, and no successor policy has been adopted. Nothing records compliance with or deployment under the fibre framework.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zambia	A national event's working group concluded that the country lacks a national broadband policy and recommended formulating one. The policy working group at a national broadband mapping event concluded that Zambia lacks a national broadband policy and recommended that one be formulated. It is a dated statement of absence by a group convened for the purpose, which is stronger evidence than a failed search. Delivery continues without it. 109 post offices were converted into digital transformation centres with high-speed internet, linked to a goal of connecting 800,000 people to affordable broadband by 2026, and a round table recorded 94 per cent connectivity coverage and K255 million approved for network-quality upgrades. Targets are being reported against; the instrument that would set them does not exist.	NO CHANGE
Zimbabwe	A Postal and Telecommunications (Amendment) Bill is before the Parliamentary Legal Committee, and a local-ownership rule was gazetted and reported repealed within weeks. The bill was gazetted in October 2025 and reached the legal committee in August 2026; the Act it amends constitutes the communications regulator, which is also the designated data protection authority (bill, watch). The ownership rule was gazetted on 12 June 2026 and reported repealed by a later statutory instrument; the repeal is reported and not verified against a primary, and no copy of the repealing instrument is held (rule). A gazetted ownership requirement whose repeal cannot be verified is a live uncertainty for every licensee in the market.	MOVEMENT

Data storage / cloud strategy

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	A second national data centre at Blida took tier-three design certification, and the national cloud is hosted at the Mohammadia data centre. Algeria is building the estate a strategy would govern, and the strategy itself is not published. The national digital services centre opened in July 2026 on dual data centres, and a second national data centre at Blida took tier-three design certification in September. Beside them sit a research cloud, an artificial-intelligence supercomputing centre at Oran and a private data centre planned at El Affroun. Energy is treated as the competitive argument for hosting here. The one cloud-specific rule is a 2022 licensing procedure under the general-authorisation regime, and a private provider still describes its cloud authorisation as awaiting regularisation under a deadline that was extended to April 2023.	MOVEMENT
Angola	A national policy for managing and hosting public data went out to consultancy in March 2026, over an estate that already has a national cloud. The policy is being written after the infrastructure was built, not before. The administrative modernisation institute put a national policy for the management and hosting of public data, with its regulation, out to consultancy in March 2026 under the digital acceleration project. That is the first instrument on the repository addressed to where public data should live. The estate it will govern already exists: a national cloud across two government data centres, the government data centre inaugurated in April 2026, and a backup and cloud centre of 48 racks. The state information systems institute holds the mandate over all of it.	MOVEMENT
Benin	A sovereign cloud is recommended and neither it nor a national cyber authority exists. No data-storage or cloud strategy is adopted. The standing position is a recommendation without an instrument: a sovereign cloud and a national cyber authority are both recommended and neither exists. Nothing in the period adopted a data-storage or cloud strategy, and no draft is held.	NO CHANGE a sovereign cloud recommended and nothing adopted
Botswana	No national data-storage or cloud strategy is held; the Tier III Digital Delta data centre is the nearest thing to one. 2025-11-25 — the Digital Delta Data Centre was launched as a Tier III certified facility, with core government systems to migrate onto it. 2025-10-17 — the Digital Services Act supplies the hosting and information-security architecture around the build. The repository holds no standalone cloud or data-storage strategy, and no policy stating where government workloads must sit.	MOVEMENT facilities with no strategy behind them

COUNTRY	DEVELOPMENTS	PROGRESS
Burkina Faso	The government cloud built 2015-2019 became a localisation doctrine: two national data centres are in operation and the agency's board made data repatriation its 2026 priority. The programme began as a distributed private cloud for the public administration built between 2015 and 2019. What it is now is a sovereignty policy with infrastructure under it: two modular data centres inaugurated at Ouagadougou under a zero-data-abroad programme to host, operate and secure all public data and to repatriate data still stored outside the country. 2026-03-24 - the agency's board set repatriation of government and institutional data to those centres as its priority objective for the year, moving the programme from build to migration. The rule underneath is not in the platforms decree: a prime-ministerial circular directing state bodies to favour national hosting is in force and applied when hosting requests are assessed. 120 platforms are inventoried and the inventory is expressly still incomplete.	MOVEMENT
Burundi	A sovereign cloud and data hubs are a pillar of the AI strategy, built around a planned data centre, with no build on record. A sovereign cloud and national data hubs are one of the six pillars of the April 2026 artificial-intelligence strategy, framed around the state technology agency's data centre. Nothing existed before it and nothing has been built since. The data centre itself is reported under data storage and remains a stated priority with no site or date. So the country has a cloud policy, a data governance strategy and a data protection statute, and no national facility for any of them to run on.	MOVEMENT a strategy pillar with no build behind it
Cameroon	The minister's one-or-two-national-backup-centres position stands, with no instrument, site or appropriation behind it since May 2025. 2025-05 - a study was restituted and the minister stated a policy of concentrating state resources on one or two national backup centres rather than multiplying public facilities, the study framed as a step to digital independence. The position has not moved since. No instrument, site or appropriation is on record, and the 269-page study that surveyed thirteen administrations is not itself held, so which facilities would be consolidated and on what timetable is unknown.	NO CHANGE
Cape Verde	There is no standalone cloud or data-storage strategy; the government cloud commitment sits inside the 2021-2024 digital governance strategy, whose annex lists a Cloud de Governo as already existing. The gazetted full text of the digital governance strategy is the only published statement of a government cloud commitment: its annex of fifty-five estruturantes lists EST-TEC7 Cloud de Governo as already existing, consumed by three measures, under the intervention area of infrastructure and security. The same annex records the integration and interoperability platform as not existing in 2021. The strategy's horizon ended in 2024 and no successor instrument carries a cloud or storage commitment. Nothing states where public data is held, on whose infrastructure, or under what retention or exit terms.	NO CHANGE a standing position the repository holds for the first time
Central African Republic	A government-wide cloud strategy is recorded as not developed against a yes target for December 2026. A development bank supervision report records the indicator for a government-wide cloud strategy developed and disseminated as not met at baseline, current and actual value, against a target of yes by 31 December 2026. Nothing later records it being drafted, and the project that carries the indicator reported 78% activity completion and 54% disbursement with six months to run - so the target date and the project's own closing date are now close together with no strategy on the record.	NO CHANGE a first stated position with no earlier account behind it
Chad	No cloud or hosting strategy is adopted; the national data centre is built and not certified, with 1,275 km of backbone deployed. The national ICT agency's own statement puts the standing position: a national data centre built with the vendor and the state fibre programme, but not yet audited, certified or in official operation (agency). A ministerial review of 19 May 2026 has the building complete and equipment installed, the security audit done and certification outstanding, institutional micro-data-centres awaiting configuration and interconnection, 1,275 km of national backbone fibre deployed, and repayment of the programme financing begun (review). Chad is exploring a partnership with an American firm to audit, certify and secure the centre before commissioning (partnership) — explored, not signed. The strategy that would say what runs there is not held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Congo	The digital acceleration project appraisal is the fullest statement of the standing position; a sovereign data-centre programme is planned and no cloud strategy is adopted. The appraisal document for the US$100m digital acceleration project is the fullest authoritative statement of the standing position on state data storage. Against it the ledger carries a national data centre, a sovereign data-centre programme and a regional feasibility study — three facilities and no policy. No cloud or data-storage strategy document is adopted at either end of the period.	MOVEMENT
Cote d'Ivoire	The minister describes a sovereign-cloud foundation under construction, provided for in the national artificial-intelligence strategy. The sovereign cloud was provided for in the March 2025 artificial-intelligence strategy as a first-pillar investment, with nothing on record being built. 2026-04-29 - the minister described a foundation under construction comprising a national data centre at Grand-Bassam, a second project at Yamoussoukro and a sovereign-cloud network. No cloud policy text, operator, capacity, cost or commissioning date has been published, and no data-localisation or classification rule is on file to say what a sovereign cloud would be obliged to hold.	MOVEMENT
Djibouti	The digital economy ministry still lists infrastructure modernisation and cloud adoption among the challenges to address, and no cloud strategy is held. 2025-10-07 - the digital economy ministry's report to the Council of Ministers names modernising infrastructure and promoting cloud adoption among the challenges still to be addressed, seven weeks after the Digital Code was published. No cloud framework, data-classification rule or public-sector hosting policy is held.	NO CHANGE
DR Congo	A sovereign government cloud is named among ministry projects to be ordered and made executable, with no hosting location or operator stated. 2026-07-29 - the sovereign cloud was named as an existing ministry project alongside the digital and data strategies, the identity platform and a certification authority, with no hosting location, operator, procurement, budget line or date stated. The repository carries no statement about a sovereign cloud before that date, so its opening position is unknown rather than zero and no direction can be stated. What exists in the meantime is a budget line for a national data centre and two privately owned facilities, neither of them a state cloud, and no hosting, classification or residency rule to govern what would sit in one.	NO CHANGE a first appearance in the record with nothing earlier behind it
Egypt	A Cloud First Policy has been in force since 22 August 2024, and the national data-centre strategy is promised by the end of 2026. The standing instrument predates the window: the Supreme Council of Digital Society adopted the Cloud First Policy on 13 March 2024 and it entered into force on 22 August 2024. It directs government bodies to prefer public cloud systems hosted in Egypt, makes data classification the starting point for choosing between models, and requires licensed and compliant providers. No implementation report, migration target or compliance deadline under it is on record. The strategy did not exist at the window's opening. It is under preparation, framed around data localisation, a regional storage and processing hub, digital sovereignty and digital-services exports; on 8 September the minister set out its scope for the first time - storage and compute requirements, investment attraction, the regulatory environment, international standards, sustainability, skills and sovereignty. 2026-09-20 - the minister told a cabinet meeting the ministry is drawing it up with other ministries as an integrated national strategy. 2026-09-22 - opening a data-centre summit, the minister said the strategy would be launched by the end of 2026. No draft, capacity target or cost is published.	MOVEMENT
Equatorial Guinea	A negotiating commission is to be created to recover the country-code domain from a foreign operator the release does not name. The commission was named in the July to December 2026 plan (plan). Nothing is established about the current administration arrangement, so the repository holds an intention to recover a domain and no statement of who holds it or on what terms. No cloud or storage policy exists beside it.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	No storage or cloud strategy is held. The nearest thing to a stated position is the state operator's own private cloud service, hosted in its own data centres. Nothing on the repository states where government data should be held, on whose equipment, or under what terms. The one document that describes domestic hosting at all is a commercial one: the state operator's private cloud service page, which offers subscription storage hosted entirely in the operator's own facilities. That makes domestic hosting the practical default without anyone having chosen it as a policy. No public body's hosting arrangement is published, no procurement rule addresses it, and no local data-storage requirement is recorded.	NO CHANGE
Eswatini	A draft national data governance policy for 2027-2031 was validated in July 2026, and a cloud memorandum with a hyperscaler is in force. The draft policy was validated in July 2026 and is targeted for completion before the end of the year; it proposes a tell-government-once principle under which a citizen supplies information once and authorised institutions reach it when delivering a service (validation). The consultancy funded to write the Digital Eswatini roadmap is scoped to cover cloud solutions and a data-migration operating model (procurement plan). A memorandum with a hyperscaler is established as a cloud-services and electronic-government arrangement, and the national data centre operates and is named a structural concentration of state information. No hosting policy, cloud-first rule or data-residency instrument for government systems is held; the closest is the data protection authority's directive that controllers record where their data is stored.	MOVEMENT
Ethiopia	A sovereign cloud and a forensic laboratory are named in the national strategy as intentions, with no separate storage or cloud policy held. December 2025's national strategy places a sovereign cloud and a forensic laboratory among the foundations it sets out (Digital Ethiopia 2030). No siting decision, procurement, operator or date exists for either facility, and no data storage or cloud strategy is held as a document in its own right.	MOVEMENT
Gabon	No cloud or storage strategy exists; the digitalisation ordinance is the framework and the first national data centre opened on 3 July 2026. The ordinance sets the principles the administration's systems must meet, universality, interoperability, security, digital inclusion and national private-sector participation, and supplies no storage or cloud policy under them. 2026-07-03 - the head of state inaugurated the first national and sovereign data centre in the special economic zone, which is in service at 92 racks over 3,000 square metres and 1 MW installed, at XAF 8bn, connected to two submarine cable systems, with a further 160 racks and over 1 MW due end-November to early-December 2026. Infrastructure has arrived ahead of the policy that would direct public workloads to it: about 95 per cent of data produced in the country is hosted outside it, and no migration plan, target or timetable is published.	MOVEMENT
Gambia	A cloud strategy runs to 2027; the cloud policy that would give it a data-sovereignty rule is unsigned. The strategy issued in June 2023 finds the Tier-2 government data centre power-constrained and reliant on generator backup, which is the condition any migration has to work around. Its companion policy sets a draft data-sovereignty and data-classification rule and has not been signed into effect. Hosting has moved anyway: the national identity data centre inaugurated at Abuko in June 2026 holds the identity system on Gambian soil.	MOVEMENT
Ghana	A data centre and cloud regulatory framework went to a validation workshop in June 2024 and has not been issued, alongside a proposed transfer of the country-code domain to a state registry. The domain has been privately managed since 1996 and no transfer had been proposed before (announcement). No instrument, date or transfer step is on record, and the repository holds no cloud or data-storage policy of any kind beside it, so a naming registry is the whole of the sovereignty-over-infrastructure record. There is a policy in development, two years unfinished. A regional digital body and the technology agency convened a stakeholder validation workshop on data centre and cloud regulation in Accra in June 2024, the communications minister stating alongside it that government data held abroad would be brought onto domestic hosting to cut operating cost and grow the domestic sector. No framework text or issue date is published, and nothing on file states whether it was ever made.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	Sovereign management of the country-code domain was reinstated in September 2025, alongside the first national data centre. The domain passed back under national management in September 2025 (sovereign management). No cloud policy, hosting rule or data-localisation instrument accompanies it, so sovereignty over infrastructure is asserted through a naming registry and a building rather than through a policy.	MOVEMENT
Guinea-Bissau	A feasibility study scoped a national cloud alongside a security operations centre and an incident response team. The study of September 2025 is the only document in the repository that treats where Guinean government data should sit: it scopes a national cloud, a security operations centre, a national incident response team and a draft cybersecurity strategy. A data centre appears separately as a budget line: the 2026 budget carries a named digital transformation investment line covering the financial system, a data centre, communications and an enterprise system.	MOVEMENT
Kenya	Cloud policy implementation guidelines opened provider accreditation in August 2026 and give state organs 24 months to migrate non-exempted systems. The 99-page document is signed by the Cabinet Secretary and cover-dated June 2026, grading providers into four accreditation classes with a register on the ministry website and a supplier-and-buyer marketplace administered by a cloud adoption committee (guidelines). Accreditation opened before that committee had been constituted (accreditation). The cloud policy the guidelines implement is itself not held: it carries a cloud-first mandate for the public sector and is cited as anchoring domestic data-centre demand, and the repository dates it 2024 in one source and 2025 in another (policy, demand).	MOVEMENT
Lesotho	A national data-centre implementation roadmap went into drafting at a six-ministry Maseru workshop in August 2026; no text yet exists. The five-day workshop opened on 17 August 2026, organised by the communications ministry with the United Nations in Lesotho and coordinated by the UN Office for Digital and Emerging Technologies (workshop). The roadmap covers data governance, skills, compute, energy, cooling, financing and implementation choices, and builds on the artificial-intelligence, data-management and broadband policies validated in draft in January 2025 (roadmap). No publication date, custodian or cost is stated, and its relationship to the separately recorded Kobong data centre is not stated.	MOVEMENT
Liberia	A cloud-first policy and a government network are named in the 2026-2029 infrastructure roadmap, with no instrument or timetable behind them. The infrastructure roadmap adopted in 2026 names a cloud-first policy and a government network among its digital commitments. Nothing published sets out what would be hosted where, under whose standards, or by when. The repository holds no government cloud policy, no hosting standard and no migration plan; the nearest binding rule is sectoral, the central bank's requirement that payment systems be hosted locally.	MOVEMENT
Libya	A National Cloud Computing Policy went to national consultation with ESCWA in January 2026; the final text is not published. The consultation was held on 1 January 2026 and the policy is framed as the arrangement for hosting government data and services, pressed on the state's sovereignty over its own data (consultation). No draft text, timetable or hosting standard has been published since, so the repository holds the intention and not the instrument.	MOVEMENT
Madagascar	No cloud or data-storage strategy is held; the physical layer was tendered in three lots in February 2026. Infrastructure equipment for the government data centres was put out to national tender in three lots in February 2026 (tender), following an open quotation for air-conditioning at the secondary site in August 2025 (quotation). Environmental and social safeguard documents for both data-centre sites were published in April 2026 (safeguards). No policy on where state data must be held, what may be hosted abroad, or on procurement of cloud services is held. The order of events is a facility built first and a hosting policy not yet written.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Malawi	No dedicated cloud or data-storage policy exists, while the national data centre is being expanded to a cloud platform. The government's own readiness assessment states that no dedicated national cloud or data-storage policy exists and recommends developing one. That is the finding, and nothing in the window changes it. 2025-12 - the ministry stated that the acceleration project is facilitating a shift toward cloud computing and that migration of government systems to the new Lilongwe data centre has begun. 2026-06 - a tender was issued to expand the national data centre with hyper-converged infrastructure and a scalable cloud-services platform. Government data is being moved onto a platform whose retention, residency and exit terms no instrument on file sets.	NO CHANGE the platform is being procured ahead of the policy that would govern it
Mali	A tier-three data centre was inaugurated on 31 January 2026 to host government platforms, with public data held abroad to be repatriated progressively. The facility arrived before the policy. The centre was inaugurated in Bamako on 31 January 2026 during the third national digital week, intended to host electronic government platforms and the state's strategic databases, with a stated availability standard of 99.982 per cent and an announced progressive repatriation of Malian public data currently hosted abroad. No adopted cloud or data-hosting policy document was located to govern it. The instrument that would is still a recommendation: the national digital week called for a data-management law and a national digital council. Until one exists, hosting policy here is the repatriation intention announced at a ribbon-cutting.	MOVEMENT
Mauritania	The national cloud launched in June 2026 over the tier-three data centre, and the regulator took up hosting and certification. Mauritania now has the estate and is writing the rules over it. The national cloud platform was launched in June 2026 and presented to the national assembly the following month, running on the tier-three data centre of 1,372 square metres and 100 racks inaugurated in May 2025. No consolidated storage or cloud strategy document is held. What governs hosting is the data-protection authority's practice: its June 2026 monthly meeting took up data hosting and the certification of the data centre, after deliberations of 2025 on foreign cloud services. The rule is arriving through the regulator rather than through a strategy.	MOVEMENT
Mauritius	No cloud or storage policy is held; a sovereign cloud market sounding reached its second clarification in September 2025. A request for information for a sovereign cloud for government reached a second clarification in September 2025 (clarification). A scale-out storage solution for the government online centre was tendered in October 2025 (tender) and awarded in March 2026 (award). The procurement is running ahead of the policy: no instrument states where government data must be held, what may be hosted abroad, or on what terms cloud services are bought.	MOVEMENT
Morocco	A Cloud First policy makes cloud the mandatory default for public technology investment, and a cloud roadmap to 2030 sits behind it without published targets. The policy made cloud the mandatory default for public-administration technology investment, with a national cloud observatory scheduled for 2027 that is not established (policy). The roadmap sets six objectives and twenty-one intervention domains, a national cloud marketplace through the development agency, sovereign cloud under the qualification decree, and a national reference architecture promised from 2026; its claimed economics are a fifth to a third off procurement cost and MAD 100bn by 2030, and its formal targets, budget and milestones are still absent (roadmap).	MOVEMENT
Mozambique	A five-year domestic data-centre plan was announced for bank and institutional hosting, and licence categories are to be extended to data centres and cloud platforms. The communications minister announced in December 2025 a five-year plan to build domestic data centres hosting cloud services for banks and institutions, with an updated regulatory framework replacing current restrictions; no site, cost, operator or milestone is stated and no implementation document has followed (plan). Extension of the digital-operator licence categories to data centres and cloud platforms was announced at the first licensing ceremony, with no date, draft or instrument (extension). One provider states it will open two availability zones and that it is the first licensed in the advanced category, on its own account alone (provider).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Namibia	No government cloud strategy is held. Cabinet directed work on a national data centre in September 2025, now funded as a flagship for 2026/27. Cabinet issued directives in September 2025 instructing the ICT ministry and the Office of the Prime Minister to finalise a concept note and project proposal for a national data centre (directives). A year on it is one of the ministry's flagship projects for 2026/27 inside a N$639.2 million budget, with no site, capacity, cost or completion date published (budget). The one binding hosting rule on the repository is sectoral: the central bank's cloud computing determination requires banking institutions to ensure their cloud providers meet data protection law including data residency requirements (determination). Two commercial facilities operate, one run by an operator and one by an aerospace company. Nothing sets a rule for where government data sits.	MOVEMENT
Niger	A feasibility study for the national data centre was completed with tender documents drafted, following a procurement notice in February 2026. The information society agency issued a tender on 4 February 2026 under the Villages Intelligents project, its first lot dedicated to data centre and network infrastructure, with bid opening set for 25 March 2026. The feasibility study reported in June 2026 covers sizing, detailed design, site selection to Tier III+ standard, tender-document drafting and a cloud and storage business plan, concluding that the government has what it needs to launch the tender. There is no published cloud or data-storage strategy instrument: what the repository holds is a facility programme and a business plan, not a policy on where public data is held or under what conditions.	MOVEMENT
Nigeria	A National Digital Cloud Policy makes cloud the default for new federal systems and sorts data into four levels, and is now being worked as investable demand rather than a rulebook. The policy is in force apart from its sovereignty provisions, which await presidential approval. It pools ministry demand through the government infrastructure company under framework agreements and sorts government and regulated data into four levels, the highest hosted only in Nigeria and the next stored at rest in Nigeria; it imposes no general localisation on commercial data, and sets a private cloud and data-centre investment target of US$250m within 12 months rising to US$750m within 24 months (policy). The National Cloud Technical Guideline 2026 is held as issued text: version 1.0, approved 4 August 2026, mandatory, commencing 1 January 2027 rather than on signature. 2026-09-10 - the agency put the policy to investors as demand rather than obligation, shifting from a regulatory posture to enabling private investment, with a National Cloud Infrastructure Strategy converting data-sovereignty requirements into investable demand and about US$1 billion of annual public IT demand anchoring domestic cloud capacity. The figure carries no breakdown or base year. The agency's Cloud Investment Strategy offers investors an Approval in Principle pathway with government as anchor customer. The companion Cloud Computing Guideline 2026 is held too, setting Cloud First for federal institutions.	MOVEMENT
Rwanda	Hosting has rested on 2012 ministerial instructions requiring critical systems at the national data centre; a shared data hub would add cloud alongside it. The founding instruction of March 2012 requires public institutions to host critical systems at the national data centre, and is still cited by the current implementation guidelines (instructions). Early market engagement in November 2025 specified a hybrid model for a shared government data hub: an on-premise national data centre core with cloud components for scalable and graphics-processing workloads (minutes). That is a procurement position, not a strategy. No standalone cloud strategy document exists; the operative rule remains an instruction fourteen years old.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Senegal	Senegal took delivery of a national cloud infrastructure in March 2026, stated to lay the foundations of a public cloud beyond the Games it was built for. The ministry records that on 24 March 2026 Senegal formally took delivery of the national cloud infrastructure hosting the strategic applications of the 2026 Youth Olympic Games, built on a Chinese vendor's stack under a contract signed in July 2025 and stated to guarantee local hosting of sensitive data. Beyond the Games it states the project lays the foundations of a national public cloud, with 200 cloud engineers to be trained and a technology centre of excellence created. The estate it sits on is the state's own: a first national Tier 3 data centre built at Diamniadio for sovereign management of state data, with a technical room reserved for smaller firms and start-ups. No published cloud policy instrument governs either; the strategy layer is a target in the technology strategy rather than a circular or decree.	MOVEMENT
Seychelles	No whole-of-government cloud strategy exists; a spatial data sharing policy provides for distributed hosting, and a data centre inaugurated in November 2024 was certified Tier IV in September 2025. The 2020 policy adopts international geospatial principles and provides for distributed data-centre hosting and for OGC and ISO interoperability standards across ministries; it is sectoral, not a whole-of-government instrument (policy). Cable and Wireless Seychelles inaugurated the Bon Espoir data centre on 15 November 2024 (inauguration); in March 2026 the operator described it as the country's first Tier IV certified data centre, keeping government services and financial institutions onshore rather than on overseas facilities (data centre). No instrument held states where government workloads are to run, or on what terms.	MOVEMENT
Sierra Leone	No storage strategy, but three facilities now exist: the national data centre at the regulator's new headquarters, the registration authority's own, and a commercial recovery hub. Sierra Leone built the estate before writing the rule for it. The national data centre sits in the telecommunications regulator's new ten-storey headquarters, commissioned in April 2026; the civil registration authority runs a tier-three facility of its own; and an operator's second facility opened at Bo. The governing documents address data rather than where it sits: the 2023 national data strategy and a data governance framework being developed with the United Nations. The ministry's own standards page names a national enterprise architecture among frameworks it holds and publishes none of them.	MOVEMENT
Somalia	Government data-hosting and cloud guidelines stand at their November 2022 baseline against an April 2028 target, recorded by the financing lender as not achieved. The guidelines are a results indicator of a regional digital integration project and the lender records them as not achieved (guidelines). They matter more here than the target date suggests: the ministry's stated rationale for a national data centre is to end reliance on storage outside the country, which is also its statement that government data was held offshore when it spoke. There is no rule governing where it sits.	NO CHANGE
South Africa	The National Policy on Data and Cloud was gazetted as final in May 2024, settling a question this report had carried as an open draft. The policy was gazetted as final. That corrects the position this report previously carried, which was that the instrument remained a draft unresolved since 2021 — a reading drawn from a research account that describes it as a draft. What the policy does is not small: it declares that data generated in the country shall be the property of the country and provides for in-country copies for law enforcement, which sits markedly apart from the adequacy logic the data protection Act runs on. 2025-12-11 — a policy direction now requires the communications regulator to weigh data sovereignty, data protection and data security in sector ownership regulation, which is the first time the policy reaches into licensing.	MOVEMENT
South Sudan	Government data-hosting and cloud guidelines are recorded as unpublished, unchanged from a 2022 baseline against a 2028 target. They are a results indicator of the regional digital integration project and the lender records them as unpublished (guidelines). That absence bears directly on the national data centre and the international gateway, both operated by the same private company, and on the question of where government data currently sits — which nothing published answers.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Sudan	A sectoral data-centre and cloud regulation stands in for a strategy, and the central bank has committed to a hybrid cloud transformation. The regulator names Regulations for the Organization of Data Center and Cloud Computing Services, 2025 as the current sector instrument; the text itself is not held and an acquisition line is open for it (catalogue). The central bank's five-year plan dated 31 December 2025 commits under its digital-transformation axis to a national disaster-recovery centre for the banking sector, an expanded data-centre network and a hybrid public-private cloud transformation project (plan). No standalone national cloud or data-storage strategy was located. Both instruments are sectoral, and neither sets a whole-of-government hosting position. The regulation's own text is now held, closing the acquisition line that stood against it (regulation), as is the 2018 statute the regulator is constituted under (Act). The sectoral instrument can now be read rather than cited; it remains sectoral.	MOVEMENT
Tanzania	A binding data-centre standard was approved in February 2026, superseding earlier guidance, alongside financial-sector cloud rules. The government data-centre standard, board-approved in February 2026 under the e-government statute, governs public-sector data-centre siting, tiering and hosting and supersedes earlier guidance, setting site-selection, power, cooling and utility requirements and confining public institutions to government-approved hosting environments. Central bank guidelines of August 2025 raise the financial sector's cloud governance baseline, barring mission-critical data from offshore hosting and setting contract requirements for redundancy and backup. A locally hosted private cloud launched in November 2025 as a domestic alternative to offshore providers. No list of approved hosting environments, and no count of workloads moved, is published.	MOVEMENT
Togo	Commercial hosting capacity advanced twice in the period; no national cloud strategy is adopted. A colocation offering opened at Lome on 15 October 2025, letting Togolese organisations place their own servers in a third-tier facility with redundant power and biometric access control. A protocol signed at Lome on 26 May 2026 between the same operator and the wholly state-owned company running the national data centre commits to a private-cloud service catalogue hosted in Togo. Both are vendor announcements. The repository holds no adopted national cloud or data-storage strategy, no obligation on any public body to use in-country hosting, and no capacity or price for the private cloud.	MOVEMENT
Tunisia	Data centres were named a priority sector in October 2025 and carried into the statutory development plan, with no budget attached. The investment authority's twenty-second strategic council presented data centres as a priority sector and positioned the country as a regional hosting hub tied to digital sovereignty, with recommendations to modernise data-protection law, expand renewables and create a cloud special economic zone. The theme is carried as a named project line in the statutory development plan alongside artificial intelligence and digitalisation, with no budget line, sequencing or delivery agency stated. The only hosting rule with legal force is the cloud provider labelling regime created by the 2023 cybersecurity decree-law; the agency's list of 17 September 2026 carries six N-Cloud entries (list). A 2024 circular directs public bodies to host software, platforms and digital infrastructure on cloud services across four tiers, each gated on the two national provider labels (circular).	MOVEMENT
Uganda	A national green data centre strategy was published with the ITU in January 2026 and a sovereign cloud launched in March; no dedicated cloud policy exists. 2026-01 - the green data centre strategy and guidelines were published with the International Telecommunication Union, addressing the environmental cost of data-centre growth alongside economic and technological competitiveness. 2026-03 - a sovereign cloud platform was launched at the Deep Tech Hub and hosted in a commercial facility at Namanve, to keep national data inside the country. The state's own storage target is utilisation rather than capacity: the IT authority's plan puts national data-centre utilisation at 70 per cent, to reach 83 per cent by FY2029/30. No dedicated national cloud policy is on record, and the green strategy is the nearest dated instrument to a storage strategy the repository holds.	MOVEMENT on a green data-centre strategy rather than a cloud policy

COUNTRY	DEVELOPMENTS	PROGRESS
Zambia	A memorandum was signed to co-invest in a national artificial-intelligence data centre, and the state operator tendered for 150TB and GPU capacity. A government cloud is treated as a planned component of the national electronic government plan's enterprise architecture rather than as a standalone strategy, and no such strategy exists. 2026-05-26 — the state technology institute and a vendor signed a memorandum to co-invest in a national artificial-intelligence data centre, announced at a mobile congress. 2026-06 — the state telecommunications and data-centre operator advertised a tender for 150TB storage engines and a GPU-accelerated server platform. Capacity is being bought before the strategy that would place it is written; no siting, ownership or hosting-policy statement accompanies either.	MOVEMENT
Zimbabwe	A sovereign national cloud is provided for in a strategy a media rights organisation records as having no legal force, and the operator states its artificial-intelligence compute is hosted abroad. The strategy mandates local storage; a media rights organisation records that it has no legal force, and a proposed act is named as the instrument that would supply residency rules (cloud, implications). The operator's own launch announcement states first-hand that the compute is hosted in a neighbouring country (siting, service, unit). A residency mandate with no legal force, and the country's principal artificial-intelligence service running outside its borders on the provider's own statement, is the sovereignty position the record supports.	MIXED a sovereign cloud and local storage mandated by a strategy with no legal force while the operator's AI compute is sited abroad

Data interoperability framework / roadmap

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	On 20 September 2026 the Council of Ministers ordered a presidential decree on a secure interoperability plan, over working exchanges in customs and property transactions. Algeria has more working exchanges than most bases hold and no published framework joining them. The national interoperability system is in development, while individual connections already run: the customs single electronic window, with import and export licences made paperless in August 2026, property transaction data exchanged under a 2025 agreement, and a national system for tracking strategic goods planned. 2026-09-20 - the Council of Ministers ordered a presidential decree on a secure digital interoperability plan, setting the missions and representation of the sectoral bodies under the high commissioner and extended to the wilayas; no draft is published. State media describes a sovereign network, IRIES, linking ministries to the national data centres. The identifier that would tie them is in place: the national unique identification number established by decree in 2023, now carried into a unified national digital identity.	MOVEMENT
Angola	The interoperability platform contract reached US$13 million and a presidential commission was created in June 2026 to update the citizen database behind it. The framework has a decree, a platform and now a governing body. The 2018 decree on public administration interoperability is the standing instrument; implementation and training terms of reference went out in February 2026, and the platform contract is reported at US$13 million. In June 2026 the president created a commission to update the database of adult citizens, with a supplementary credit of US$275 million behind it. The one exchange already running in production is narrow: the tax authority's compliance certificate served to other state bodies. Nothing publishes a roadmap with dates. 2026-10-01 - the interoperability framework study was completed and the platform is under tender at about US$13.0m.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	A national digital public infrastructure roadmap was drafted in July 2026 on a once-only principle, and architecture referentials went to consultation. 2026-07-31 — a national roadmap was drafted with two external institutes to link fragmented government systems around a once-only principle, the state ceasing to ask citizens for documents it issued itself, the agency framing the hard part as governance and coherence across infrastructure already built when the work was launched a fortnight earlier. 2026-07-01 — architecture and application-integration referentials were opened to consultation, to end siloed platform-building. Neither existed before. Both are governance instruments over an exchange that has run since 2020 and is carrying tens of millions of requests a month, reported under data exchange. The sequencing is the notable part: the platform came first and the doctrine for using it is being written six years later.	MOVEMENT
Botswana	The Digital Services Act requires a framework for secure exchange of information and an information gateway; neither the framework nor a roadmap is published. 2025-10-17 — sections 12 and 22 require a standardised framework for secure exchange of information and an information gateway. 2026-02-17 — a programme running since August 2024 is improving and aligning the national interoperability framework, its standards, guidelines and tools. No framework document, roadmap or timetable has been published, and the repository carries nothing on the gateway being built.	MOVEMENT a statutory duty with no published framework
Burkina Faso	The national interoperability framework is left by the platforms decree to a prime-ministerial order, and no held source states its content, publisher, version or status. Article 7 of the 2024 platforms decree leaves the national interoperability framework to be adopted by prime-ministerial order, and article 6 conditions a platform's go-live on conformity with it. No held source states its content, publisher, version or status. So a decree makes conformity with a framework a condition of service, and the framework is not on the record. It is the central missing object of the exchange layer: every platform reported in this document went live under a test whose terms are unpublished, and an order adopting the framework would settle it.	NO CHANGE
Burundi	A cross-government information-systems concept was presented for validation in December 2024 as the route to adopting international ICT standards. 2024-12-17 — the state technology secretariat presented the final Concept type des systemes d'information des institutions publiques to stakeholders for validation, described as a foundation of digitalisation permitting the adoption of international ICT standards. What the record shows is presentation for validation, not formal adoption. No published text, adopting instrument, technical specification or compliance obligation on ministries is held, so the repository can date the document and cannot say what it requires of any institution.	MOVEMENT
Cameroon	The state operator was tasked with carrying national data and infrastructure interoperability on 18 August 2026, with no design or timetable published. 2026-08-18 - the posts and telecommunications ministry tasked the state operator with carrying national data and infrastructure interoperability, the mandate given at the opening of the national internet governance forum and resting on the operator's backbone, transmission, access and hosting infrastructure. No design, timetable, budget or instrument is published. An interoperability mandate handed to a commercial operator rather than established in law leaves unstated which bodies are obliged to connect, on what standard, and who arbitrates a refusal.	MOVEMENT
Cape Verde	The framework is mandated and unpublished: a June 2025 resolution vests in the digital service team the competence to define it and make it mandatory, while the diploma on interoperability standards remains unadopted. 2025-06-10 - a resolution creates the Portal Unico, names identification, interoperability and payments as the digital public infrastructure building blocks, vests in the digital service team the competences to coordinate implementation of the interoperability layer and to define the interoperability framework and make it mandatory for all electronic governance initiatives, and requires the state technology operator to ensure every public administration information system carries APIs allowing articulation with the portal. No framework document has been published since. The companion diploma on interoperability standards is likewise unadopted, and no separately promulgated technical standards document exists — a mandate with no artefact under it.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Central African Republic	A government platform launched in February 2026 is at pilot stage; the digital governance project reached 78 per cent progress. There is no published interoperability framework, and there is now a platform. A government interoperability and data platform was launched in February 2026 and is at pilot stage, its use in the planning ministry described separately. It sits inside the public sector digital governance project, which reported 78 per cent progress in August 2026 and whose procurement plan of February 2026 sets out what remains to be bought. The cloud strategy that would sit above it is still planned, and no roadmap with dates has been published.	MOVEMENT
Chad	No national interoperability framework is published; the agency states the mandate and administrations sign bilateral protocols instead. The national ICT agency states that it coordinates government information systems to ensure their interoperability, and publishes no standard, schema or exchange rule against that mandate (mandate). What exists is point to point. The tax and treasury directorates agreed automated, secured, real-time exchange of assessments, collections, arrears and payments on 1 April 2026 (protocol), extended on 21 July 2026 to customs and the central bank (extension). The first phase of a national data governance strategy closed on 21 May 2026 naming interoperability among the priorities to be reinforced (phase). No technical specification for any of the protocols is published.	MOVEMENT
Comoros	An interoperability framework is named as a component of the national e-government plan; no framework document or roadmap is published. The citizen portal's concept note is the first record on file to name a Cadre d'Interoperabilite, sitting inside the Plan National e-Gouv beside a government enterprise architecture; the portal is still cataloguing the sectoral platforms it would federate, which places the work before design rather than at it. The government interoperability and data-exchange platform remains a procurement line under the e-government modernisation project, unbuilt. The one interoperability now operating is in payments, not data: Komor Switch was launched by the president on 4 May 2026 as a platform linking financial actors. No sequencing, owner or date attaches to the data framework itself.	NO CHANGE the framework is named in the national e-government plan and the exchange platform is still at procurement
Congo	A national digital public infrastructure architecture is planned, and the appraisal document is the fullest statement of the standing position. The project appraisal is the fullest authoritative account of where interoperability stood. The ledger carries a national digital public infrastructure architecture and an inter-administration data exchange platform, both planned rather than in service. A roadmap exists as a project component; no adopted interoperability framework does.	MOVEMENT
Cote d'Ivoire	The general interoperability framework adopted by decret n 2021-913 is the standing instrument and did not move in the window. The framework was adopted by decret n 2021-913 of 22 December 2021 as the general reference framework for interoperability of information systems, and nothing in the window amended, replaced or extended it. The operating platform built to it is carried under the national data exchange indicator. What the repository does not hold for the framework itself is any conformity regime: no certification, no compliance obligation on a public body, no register of systems assessed against it, and no evaluation since adoption.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Djibouti	An interoperability framework is published by the state information-systems agency, with no evidence of application on file. The Cadre d'Interoperabilite de Djibouti sets twelve principles, four interoperability layers - legal, organisational, semantic and technical - and a conceptual model for integrated public-service delivery. The ministry's own service inventory found the administration fragmented and unevenly equipped, with 503 public services catalogued and 83 selected for digitalisation, which is the closest thing on file to a roadmap and does not reference the framework. No adoption instrument, compliance record or implementation schedule for the framework is held. 2026-09-06 - the framework acquired a statement of intent for the first time since publication: the Council of Ministers' 2026 work programme of 1 September names paperless services and interoperability among the state-modernisation priorities. Nothing in it evidences the 2022 framework in use, and no system, timetable or budget is attached.	NO CHANGE
DR Congo	The e-government strategy's master plan, governance framework, enterprise architecture and interoperability framework are all still to be defined by a consultant. The strategy is named but not operational: its strategic priorities, master plan, governance framework, enterprise architecture and interoperability framework are all still to be defined by a consultant not yet appointed. It is dated 2025 to 2030 and its defining work was still being tendered in mid-2026, which is the whole of the movement here. No standard, reference architecture or connection obligation on any public body exists on file, and the minister's July 2026 statement of common bases on a national architecture reference framework is the same object restated at ministerial level with nothing built.	NO CHANGE the framework and the architecture are still deliverables of a consultant not yet appointed
Egypt	The ministry names linking government digital systems as the strategic objective; no framework or roadmap is published. The ministry's programme page for digital government names data as a main transformation platform and the linking of government digital systems as the strategic objective. No published national interoperability framework accompanies it. What exists instead is a count of connections: 105 government entities connected electronically and 242 services on the national platform as at July 2026. A connection count is not a framework. Nothing states the standard those 105 entities connected against, or what a 106th would have to meet.	NO CHANGE a first stated position with no earlier account behind it
Equatorial Guinea	The World Bank diagnostic found no interoperability framework, and none has been published since. The diagnostic records the absence plainly: no interoperability framework and no digital skills data held. Where the problem surfaces operationally it is named as such: the third steering-committee meeting of the civil service management project in June 2026 reviewed 22 procedures and identified interoperability as the challenge. A national digital economy strategy was still being finalised with World Bank support in September 2026.	NO CHANGE
Eritrea	An action plan to domesticate the UN geospatial information framework was filed with the regional economic commission in April 2026 (action plan). An action plan to domesticate the United Nations Integrated Geospatial Information Framework for Eritrea was filed with the regional economic commission's data and geospatial section on 6 April 2026 (action plan). The position it moves from is comprehensive absence: a 2022 structured assessment records no government enterprise architecture framework, no government interoperability framework, no data quality framework and no government service bus platform (dataset). The plan is geospatial in scope rather than whole-of-government, and the repository holds no adoption date, budget or implementing body for it.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Eswatini	A national data exchange platform is proposed in the draft data governance policy; no interoperability framework document is held. Mchumanisi is proposed as the platform through which authorised institutions would reach information a citizen supplies once, with birth and marriage certificate services named among the intended uses; no specification, procurement or timetable is held (proposal). The ICT ministry's report to Parliament for 2024/25 records GovStack-model application development and a review of the electronic-government interoperability framework (report). The World Bank consultancy funded to write the digital roadmap is scoped to include data interoperability as a public-infrastructure building block (procurement plan). Against all of that, more than half of ministries lack meaningful system interoperability on the repository's own measure. The framework is reviewed, funded and proposed, and not published.	MOVEMENT
Ethiopia	The e-government interoperability framework has been in development since July 2024 and the repository records no completion. The framework was published in July 2024 and is recorded as still in development two years on (the framework). No adopted version, compliance mandate or list of systems built to it is held, which is the gap the approved national data exchange platform would have to close.	NO CHANGE
Gabon	The roadmap is a financed programme: an appraisal document records back-office systems siloed with no integrated platform and finances a common interoperability framework. Five years on it has happened in health. The appraisal document records that government back-office systems were siloed with no integrated platform linking them, and finances a common interoperability framework and an interoperability platform for shared government services, alongside digital identity, health, social protection and public human-resources systems. At appraisal interoperability was an objective to be built. 2026-06-24 - the health information system project closed documenting interconnection of health facilities and a shared computerised patient record — one sector interconnected, not a national framework adopted. 2026-02-19 - a single-window programme presented to the presidency frames the same ambition around public financial systems, with an explicit digital-sovereignty framing of mastering and securing the State's strategic data. The platform itself is still unnamed in the repository and was one of four public-administration projects set out at the sixth steering committee, with no value published above the zero baseline.	MOVEMENT
Gambia	An interoperability framework was proposed in 2020 alongside an ICT agency; the agency exists and the framework does not. The e-government strategy for 2021-2024 proposes both a government interoperability framework and an ICT agency, and records that no interoperability layer existed as at 2020. The agency was constituted and lists powers over a government data bank, technical standards, electronic signatures and cloud services. None of those powers has produced a published framework, and the register-to-register indicator that would show one working still stands at zero.	NO CHANGE
Ghana	The interoperability framework is the whole-of-government instrument and is labelled a draft for stakeholder review, with no approval held. The technology agency's whole-of-government interoperability instrument updates an ineffectual 2008 predecessor and is labelled a draft for stakeholder review. No formal approval and no operative successor appears anywhere on this ledger. The document carries no printed date and the held capture stops in its chapter two of twelve, so what it obliges beyond its principles is not established here. What has moved is around it rather than in it: a government data exchange hub, a data exchange Act and a data harmonisation bill are all separately on this ledger, and none of them is stated to be made under this framework.	NO CHANGE the framework has stood as a draft for stakeholder review with no approval on record

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	The roadmap names the absence of interoperability between state systems as a standing weakness and programmes six numbered initiatives against it; a design workshop opened in April 2026. The plan is explicit about the gap it is answering. It programmes mapping of existing information systems, an interoperability guide, a data exchange policy, mutualisation of government digital resources, a national interoperability platform and a government enterprise architecture, alongside establishing the data protection authority and formulating an open public data policy. It is a plan, not evidence that any framework or platform exists. 2026-04-07 - the state digitalisation agency opened a three-day workshop on electronic services and the interoperability of public information systems, with the prime minister's office calling for concrete recommendations and follow-up mechanisms. A design and coordination workshop, not an adopted framework. The platform side has moved further than the framework: an interoperability platform is run by the agency to let public information systems communicate so a user need not supply the same information twice, and a national e-service portal and a national interoperability portal are being built under the regional digital programme.	MOVEMENT
Guinea-Bissau	Decree 27/2025 sets national interoperability rules and consultants delivered the platform design in November 2025. The framework moved from intention to instrument in the window. The government approved the national interoperability regulation by decree in October 2025, with the gazette date disputed in the record. Consultants then delivered the interoperability structure, the platform and an action plan for digitising the main public services. The cabinet had approved the data governance and protection policy, the cybersecurity strategy and system interoperability together in September 2025.	MOVEMENT
Kenya	The enterprise architecture and interoperability framework is the standing roadmap, in its second edition since 2023. The framework was approved by the ICT Authority as a second edition and is the country's standing instrument for government enterprise architecture and interoperability (framework). A workshop in November 2025 took it to institutions under the digital economy acceleration project (workshop). A national data governance policy is still in validation (validation). The framework predates it, so the architecture standard is in force while the policy that would set the rules for the data moving across it is not.	NO CHANGE
Lesotho	An enterprise architecture and interoperability framework was commissioned in 2024; neither it nor a roadmap has been published. 2024-07-22 — terms of reference commissioned the government enterprise architecture and e-government interoperability framework. 2025-08-26 — the communications ministry opened a two-day workshop to develop a digital public infrastructure framework. Two years on from the commission, no framework document, roadmap or timetable is on the record, and the repository carries nothing on what the architecture covers.	MOVEMENT commissioned and unpublished
Liberia	Executive Order 163 requires a first release of a Government Interoperability Framework within 180 days; none is published. Executive Order 163, signed 22 April 2026, creates the Office of Technology, Digitalization and Innovation as the central authority for government-wide technical standards and sets a 180-day deadline for a first release of the framework, alongside an enterprise architecture framework and a digital systems inventory. The terms of reference for the office's chief technology officer, published in July 2026, assign the duty to develop and maintain the framework with its data-exchange standards. Neither the framework nor a draft of it has been published.	MOVEMENT
Libya	A roadmap proposes an interoperability framework and none had been adopted as at December 2025. The regional commission's roadmap sets out best practice and proposes a Libyan government interoperability framework; nothing had been adopted when it was published. The governance layer that exists is a method rather than a standard: the information authority's national guide for government data sets a six-stage approach with no interface specification or schema behind it. The mandate to interconnect state bodies has sat with the authority since a 2018 decision.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Madagascar	The 2022 interoperability framework was given a legal institutional basis by decree in December 2025. The framework was published in November 2022 as a technical instrument establishing an X-Road-based architecture and a coordinating role for the digital governance unit (framework, page). A decree of December 2025 set the institutional framework for interoperability, giving the arrangement a basis in law (decree). The platform built on it launched its first stage in April 2026 (launch). The decree's own text could not be captured, and the framework is held only to its second section; the governance model and architecture chapters are not in the repository.	MOVEMENT
Malawi	The service bus is one of five core programme priorities with 25 e-services at advanced onboarding; no published framework governs it. The roadmap is seven years old: the 2019 digital government strategy carries the interoperability and common-architecture recommendations and the sequencing, and it has not been replaced. 2025-05 - the readiness assessment identifies the absence of a government-wide data-exchange platform and recommends one. 2026-02 - the fifth technical committee meeting named the enterprise service bus one of five core priorities and put 25 e-services at advanced-stage onboarding onto the national exchange platform. The platform is being built and the framework that would set the standards for what crosses it is not on file, which is the same gap the readiness assessment named.	MOVEMENT
Mali	The digital week recommended a data-management law and a national digital council; the government intranet and a public key infrastructure are the pieces in hand. There is no published interoperability roadmap. The nearest thing is a set of recommendations: the national digital week of August 2026 called for a data-management law, a national digital council and a single national transport operator, framed as digital sovereignty. The technical pieces exist separately. A government intranet is being built alongside administration of the country-code domain; a public key infrastructure framework was drawn up with the telecommunications union and remains planned; and the one working cross-border exchange is narrow, a customs interconnection piloted with a neighbour in August 2026.	MOVEMENT
Mauritania	The administrative procedures portal launched in February 2026 with a stated three-phase roadmap ending in integration into the government services platform. The clearest cross-government roadmap of the window came with a portal launch. At the 16 February 2026 launch of the national portal of administrative procedures, the minister set out three phases: centralise and publish every procedure on one national platform, keep them updated and reliable in coordination with each sector, then fully digitise the most-used procedures and integrate them into the government services platform. The portal centralises the procedures it publishes on one address. Two other tracks bear on it: a national framework for public digital services standards, and a national data management system being worked through blockchain workshops in the public administration.	MOVEMENT
Mauritius	The national data strategy of January 2026 is the first roadmap over a sharing platform that has run since 2016. The sharing layer is the older half: a platform in service since 2016 through which government agencies exchange data (platform). A national data strategy for 2025 to 2029 was published in January 2026 and names that platform as what it builds on (strategy). Data measures were carried into the 2026-2027 budget in June (budget). What the repository does not hold is a technical interoperability standard, a service catalogue, or a count of agencies connected to the platform.	MOVEMENT
Morocco	The AI Made in Morocco roadmap names a digital commons platform, a twenty-interface library and once-only exchange, on a trade-press account rather than a published text. A trade-press account of January 2026 sets out ten programmes under the roadmap, of which the data and interoperability strand names a digital commons platform, a library of twenty application interfaces and a once-only principle (programmes). No ministry document setting out an interoperability framework or roadmap has been published, so the strand is on record only as reported and carries no timetable, custodian or list of participating administrations (roadmap).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mozambique	The e-government interoperability regulation reached the final consultation on its revision in June 2026, and a national data governance policy and strategy was validated in December 2025. 2026-06-11 — a two-day national workshop held the final consultation on the revised government interoperability regulation before its approval. It is the single cross-cutting governance movement in the window, bearing on education, social protection, identity and local government alike. 2025-12-05 — a validation workshop was held on the draft national data governance policy and strategy and its action plan, the broader framework the interoperability regulation sits under. The operative instrument is still the original: the 2017 decree establishing the e-government interoperability framework, its principles, the ICT institute's regulatory role and the state information agency's platform role. Neither the revision nor the data governance policy is approved, so the roadmap has moved and the framework has not.	MOVEMENT the 2017 framework reached final consultation on its revision
Namibia	The spatial data infrastructure policy of 2015 is the one gazetted cross-government sharing framework; a general interoperability framework drafted in 2016 was never gazetted. The spatial data policy was gazetted in March 2015 as the framework for sharing spatial data across government (policy). For everything else, a government expression of interest carries the fullest dated account: an interoperability framework drafted by the Office of the Prime Minister's public service information technology management department in 2016, modelled on Estonia's data-exchange layer, with no gazetted framework, adoption date or implementing platform since (timeline). Where a roadmap does exist it is in payments: the central bank's vision and strategy for 2026 to 2030 sets open banking, the quick-response standard and application-programming-interface interoperability as central themes (vision), operationalised for open banking by a guidance note in January 2026 (guidance). The sector with a roadmap is the sector with a regulator that writes them.	MOVEMENT
Niger	The 2019 law on electronic transactions is the only framing instrument on file, and no interoperability roadmap sits under it. The 2019 law on electronic transactions frames electronic transactions across Nigerien territory, setting the rights, obligations and responsibilities of the parties, the rules on electronic signature and data retention, and the penalties for breaching them. Nothing in the window publishes the framework's content, a technical specification, a compliance duty or a roadmap for applying it, and no register of systems assessed against it exists in the repository.	NO CHANGE no interoperability framework or roadmap is published
Nigeria	Draft technical standards for digital public infrastructure have been in draft since April 2025 with nothing published since. The standards were in draft in April 2025 and remain so (standards). A national data exchange is meanwhile moving personal data in production behind the government service portal, so the exchange is running ahead of the standards that would govern it.	NO CHANGE
Rwanda	A national digital public infrastructure strategy launched in March 2026, and a shared data hub went to early market engagement four months earlier. The strategy launched on 9 March 2026 sets a shared architecture for interoperable digital identity, payments and trusted data exchange (launch). The hub that would carry it went to early market engagement in November 2025, specified as an on-premise core with cloud components (minutes). The sequence is unusual and worth noting: the procurement of the interoperability platform preceded the publication of the strategy it serves by four months. 2026-10-02 - the information society authority says the shared government data hub is moving into implementation, the existing Data Sharing Platform serving in the interim.	MOVEMENT
Sao Tome and Principe	A national interoperability framework has stood at draft version 0.1 since November 2021, with mandatory and recommended technical specifications and no later version held. Version 0.1 was developed by two United Nations bodies in consultation with the identity institute and published on its portal, setting out scope, per-dimension policies, a compliance regime and technical specifications (framework). A sectoral interoperability platform was delivered in the window: the electoral reform project presented a platform linking the civil registry databases to the electoral roll, built by a Portuguese university (platform). So the framework a whole-of-government exchange would be built to remains a draft five years old, while the one working linkage was built to a project's own design.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Senegal	The national interoperability platform launched in March 2026 with two use cases in production, its adopting decree still a draft. The ministry records three consecutive days in March 2026: the platform's official launch on 24 March, a cross-government workshop on 25 March prioritising the use cases making up the 2026 roadmap, and a steering committee on 26 March validating the first phase's deliverables. Two use cases are stated in production — the health-cover body reading social-protection data in real time to automate enrolment, and the tax directorate automatically retrieving validated customs declarations for fiscal reconciliation. The first phase delivered a framework, a draft decree and a sovereign platform. The platform's own portal offers an interface gateway, digital identity and data exchange on an open-source layer; its live counters for connected administrations, active interfaces and monthly transactions render empty. Four months before the launch an independent supervision report recorded both interoperability indicators still at No as of the last measurement, with targets of Yes by May 2028. 2026-09-24 — the ministry called for firms to study the platform's infrastructure needs, to grow a start-small X-Road set-up into a multisite architecture across national and sectoral data centres, closing 7 October.	MOVEMENT
Seychelles	No whole-of-government interoperability framework is held; the spatial data sharing policy and the ICT department's standards mandate are the nearest instruments. The 2020 spatial policy provides for OGC and ISO interoperability standards across ministries within its own domain (policy). The ICT department states that adopted technical standards for the seamless interoperability of e-government services, and the integration of every e-government application and database, fall within its Policy, Standards and Research Section's mandate (mandate); the standards themselves are not published. What is held is a sectoral policy and a departmental mandate, and no roadmap, target architecture or sequencing plan behind either.	NO CHANGE
Sierra Leone	A Government Service Bus and X-Road data exchange layer is piloting, with a World Bank supervision mission tracking it. The exchange layer is piloting on X-Road under the Ministry of Finance, with no production date, connected agencies or governance rules published (layer). A World Bank implementation support mission of September 2025 took the service bus as one of its subjects (mission). A roadmap in the ordinary sense - sequenced, dated, with an owning institution - is not held. What exists is a build in pilot and a supervision record of it.	MOVEMENT
Somalia	The e-government strategy published in August 2025 states the federal government lacks an interoperability framework, and sets out the architecture that would supply one. The strategy and roadmap for 2025 to 2029 states plainly that the federal government has no enterprise architecture or interoperability framework, and prescribes the correction: standardised solutions with open interfaces, a data-exchange hub, a national enterprise service bus, shared services and a whole-of-government approach (strategy). A document that names the gap is not the same as a framework that closes it. Nothing on the repository records the hub or the service bus being built. What exists in practice is bilateral: the school certificate system connects identity, payment and registry building blocks for one service (system).	MOVEMENT
South Africa	The national data exchange pilot has infrastructure operational and four departments testing it, on a term ending in September 2026. A one-year pilot runs from October 2025 to September 2026 with four task teams, interoperability standards and draft data-exchange legislation as its deliverables. 2026-01 — pilot infrastructure is operational at the national research council, with home affairs, the social security agency, the student aid scheme and the public service department testing it and a working single-citizen application prototype built. 2026-06-23 — the pilot is confirmed as ending in September 2026. So the roadmap exists as a dated pilot with named participants and named deliverables, which is more than most instruments on this ledger carry. What it does not carry is a decision point: no source states what happens at the end of September, or who decides.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
South Sudan	A government enterprise architecture is in commissioning; no adopted interoperability framework exists. The ministry's own current-projects page lists hiring a firm to develop the architecture and its implementation plan as active work under the regional digital integration project (projects). Procurement for the consulting service was launched in May 2026 (tender). A tender is the earliest stage a roadmap can be at. Nothing adopted, sequenced or dated exists behind it, and the exchange layer it would govern is separately recorded as not established.	MOVEMENT
Sudan	The nearest thing to a roadmap expired in 2020; interoperability now appears as a platform design principle rather than a framework. The e-government and smart transition plan for 2016 to 2020 is identified as the closest Sudanese instrument to an interoperability roadmap, and it has expired (plan). The ministry's own product page for the government-institution platform names interoperability among its design principles and lists 23 integrated government institutions (product page). A platform that integrates institutions is not a framework other systems can be built against. The repository holds no published architecture, no data standards and no sequencing plan.	NO CHANGE
Tanzania	A 2016 framework sets the interoperability standards, and a data governance strategy reached validation in March 2026. The 2016 interoperability framework defines nine technical-standards areas that public institutions must follow. A national validation workshop in March 2026 advanced a draft electronic data governance strategy, setting interoperability, data-sharing and stewardship direction aligned with the digital economy framework, toward formal adoption; the government's own representative described it as not yet adopted. The 2024/25 audit of 133 entities records continuing system fragmentation and weak controls despite the statutory framework. A ten-year-old framework and an unadopted strategy is the roadmap on this record.	MOVEMENT
Togo	A common interoperability framework is published inside the state enterprise-architecture guide, and is still a draft on its own publisher's record. The enterprise-architecture guide defines a Cadre Commun d'Interoperabilite — a duty to define and maintain, across the state administration, the norms applicable to exchanges between administrations, over four levels of interoperability. The guide's own version page records version 1.0, prepared by the digital agency, status Brouillon, with the version date, reviewer and review date fields blank and an empty revision table. A published normative text is not an adopted one: no decree or order giving the framework force of law appears anywhere in the repository, and the guide names that step as still outstanding.	MOVEMENT
Tunisia	The 2020 implementing decree creates a strategic committee to pilot the national interoperability strategy; the strategy itself is not published. The implementing decree of the interoperability decree-law sets the operator's duties and creates a strategic committee tasked with piloting the national interoperability strategy, alongside a coordination committee. The platform itself moved from a five-ministry proof of concept to a contracted second phase extending it to the business register, the investment authority, the industry and export promotion agencies, the finance ministry and the central bank, for completion in 2027. What is missing is the roadmap the committee exists to pilot: no strategy document, framework specification, standards catalogue or committee minutes is held.	MOVEMENT
Uganda	The interoperability framework and its reference architecture were renewed in May 2026, and the exchange platform reaches 37 per cent of agencies. The technical layer has been in place since 2021: the reference architecture delivered in September 2021 provides a controlled vocabulary, architectural building blocks and a method for identifying interoperability standards. 2026-05 - renewed enterprise-architecture and interoperability documents were delivered with the e-Governance Academy and World Bank support, with no rollout reported. 2026-06 - the roadmap acquired a number: the exchange platform connects 37 per cent of ministries, departments and agencies and is to reach 73 per cent by FY2029/30. Neither renewed document is held, so what changed between the 2021 architecture and the 2026 renewal cannot be established from the repository. 2026-10-01 - the information technology authority said the platform connects the identity register to more than 150 agencies, banks and telecoms operators.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zambia	A 2019 interoperability standard was extended by a spatial data infrastructure policy and geoportal launched in June 2026. The public service electronic government interoperability standard, first edition 2019, is the country's own national instrument — the framework the rest of the estate is meant to connect through. 2026-06 — a national spatial data infrastructure policy for 2026-2030 and a national geoportal were launched on open-source software, with the electronic government division as lead authority. It extends interoperability to geospatial data, which government describes as ending fragmentation across agencies. What neither carries is a compliance record: no count of systems conforming to the 2019 standard, and no obligation on any agency to join the geoportal, is held.	MOVEMENT
Zimbabwe	A government enterprise architecture blueprint was handed over in May 2026 and a service bus announced; no interoperability framework document is held. A customised government enterprise-architecture framework, strategy, roadmap and change-management plan was built over September 2023 to September 2024, with representatives of more than 40 ministries, departments and agencies taking part (project). The blueprint was handed over to government ICT directors in May 2026, and the ICT minister put radical interoperability first among five priorities, announcing a government service bus and an integrated online portal for once-only data sharing (handover, priorities). A National Migration Data Strategy 2025-2030 was launched on 15 May 2026 with the migration agency and the statistics agency, a sector data-sharing framework rather than a national one (migration data). No published interoperability framework, data-exchange specification or service-bus procurement is held.	MOVEMENT

AI strategy

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	Implementation runs under the higher-education minister: five thematic commissions were set up on 8 September 2026 after a joint roadmap in August; the strategy text is unpublished. The strategy was adopted by the national artificial-intelligence council in December 2024 on six pillars, and its deployment plan was reviewed by government on 25 May 2026 ahead of a Council of Ministers adoption that is not recorded as having happened. 2026-08-05 - a first interministerial meeting fixed priorities: sovereign open-source government models, national high-performance computing, university curricula, a national research centre with specialised units, and administrative and public data processed and hosted in national data centres, the roadmap being fixed by the higher-education minister and the deployment agreed jointly. 2026-09-08 - a second coordination meeting set up five thematic commissions, a national AI and data research centre and a target of 50,000 AI specialists by 2030. The state's own account is on record, filed with an international body: Algeria's contribution to the UN science and technology commission's 2025-2026 theme on artificial intelligence sets out the national artificial-intelligence council, a strategy dated December 2024 and the national higher school of artificial intelligence. 2026-09-22 — a follow-up meeting approved an updated draft decree creating the national AI and data research centre and set 17 infrastructure and 14 data operations for 2026.	MOVEMENT
Angola	A readiness assessment names the absence of an artificial-intelligence strategy as a gap, with no adoption date, drafting body or timetable on record. 2026-06-30 — preliminary findings of a UNESCO readiness assessment were presented to the ministry, identifying the absence of a dedicated artificial-intelligence instrument as a gap and offering the assessment as the repository for future policy. The same assessment scores 50.9% of its indicators fully ready, 32.7% partially ready and 16% insufficient, with data governance at 47 out of 100 and science-workforce availability at about 12%. The higher figure quoted elsewhere is the first two bands added together and is not a readiness score. No adoption date, drafting body or timetable for a strategy is on record. What the country has instead is a draft artificial-intelligence law, reported under legislation, which is an instrument without a policy behind it.	NO CHANGE the absence now documented rather than closed

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	The 2023 to 2027 national artificial-intelligence and big-data strategy remains in force, with a fresh strategy mandate given to the renamed ministry. The 2023-2027 national artificial-intelligence and big-data strategy is in force and was in force at the start of the window; the country rose from 145th globally to the sub-Saharan top five on an artificial-intelligence readiness index in three years. Nothing in the twelve months to 2026-08-26 amends, replaces or reports against it. What did change is around it: the ministry renamed in May 2026 carries an explicit mandate for a national artificial-intelligence strategy, which implies a successor instrument that has not appeared, and the presidential programme's supercomputer and data-monetisation commitments sit outside the existing strategy's scope.	NO CHANGE
Botswana	The National AI Policy was reported at an advanced stage in December 2025 and is not adopted. 2025-08-13 — an assistant minister said the policy was being finalised, naming pilots in agriculture, remote-area health diagnostics and the digitisation of licensing and social welfare. 2025-12-22 — the country profile still records the policy at an advanced stage, four months later. The readiness assessment behind it was completed and published. No draft text, adoption date or implementation plan is held.	MOVEMENT at final drafting for a second year
Burkina Faso	A national artificial-intelligence roadmap for 2026 to 2030 was validated in June 2026, its text unpublished, and a regional community strategy was commissioned. 2026-06-17 — a national roadmap for 2026 to 2030 was validated at a national workshop under an artificial-intelligence-for-all banner, aligned to the national recovery plan, reported the same day, against no national strategy and drafting not yet begun a year earlier. The document itself is not held and formal adoption or publication is not established. 2026-07-14 — a regional commission undertook to prepare and adopt a community artificial-intelligence strategy in a very short time, building on the four member states that already hold national strategies, Burkina Faso among them. No timetable, drafting body or budget is stated. A validated roadmap whose text nobody outside the workshop has seen is the weakest form of instrument this frame records, and the dedicated regulation it anticipates is reported under control of artificial-intelligence abuse.	MOVEMENT
Burundi	A National AI Strategy for 2026 to 2030 was validated in April 2026 on six pillars, including a sovereign cloud and health and agriculture pilots. It has since gone to Seoul looking for financing. 2026-04-22 — the strategy was validated on six pillars: governance and ethics, sovereign cloud and data hubs, education and research, innovation and incubators, human capital, and about fifteen health and agriculture pilots, and it was presented as the centre of the country's digital strategy. It sets a target of training more than a thousand officials. It follows a national readiness diagnostic run in November 2025. No implementing decree, budget line or first pilot has been reported since validation, and the compute the strategy assumes does not exist: no source on this ledger states any national computing capacity. 2026-09-10 — the finance and budget minister presented the strategy's ambitions at the Korea-Africa economic cooperation ministerial in Seoul, seeking financing and partnerships to turn it into concrete projects. No commitment, partner or project came out of it on the record, and no budget or implementation plan for the strategy is published.	MOVEMENT
Cameroon	A February 2026 workshop delivered recommendations for an AI framework that is still absent. A ministerial workshop on 17 and 18 February 2026 delivered recommendations to the minister calling for a progressive risk-based AI regulatory framework, an interministerial coordination mechanism and a dedicated observatory or authority, all of them still absent. UNESCO published a national report on AI ethics with the ministry in February 2026, and a regulatory sandbox for artificial intelligence had been announced in June 2024. Recommendations are not regulation. No national AI strategy, coordination mechanism or authority exists on the record.	STALLED recommendations delivered and no strategy adopted
Cape Verde	Drafting of a national artificial-intelligence strategy was kicked off with European Union representatives present, reported in May 2026, with no draft text held. None was published at the window's opening; a named analyst noted in April 2025 that more than sixty countries had national strategies and argued this one should adopt one. 2026-05-04 - drafting was reported kicked off with senior officials, the Secretary of State for the Digital Economy, external consultants and European Union representatives, the government stating the framework will be designed for responsible and ethical use in the public interest. No draft text, timetable or budget is held. It was paired with the data strategy in one kick-off and the two are separate instruments, so both now stand at the same stage: launched, unpublished and undated.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Central African Republic	The minister stated in November 2024 that an artificial-intelligence strategy for 2024 to 2028 was in elaboration; nothing has appeared since. 2024-11-21 - the digital economy minister stated that the country was in full elaboration of a national artificial-intelligence strategy for 2024 to 2028. Twenty-one months on, no draft, adoption instrument or text has appeared, and the strategy's own stated period is more than half elapsed. No regulation of artificial intelligence is held either. What the country does hold on artificial intelligence is outside government: a translation system for the national language built independently and a machine-learning price-imputation platform run by a development bank.	NO CHANGE a first stated position with no earlier account behind it
Chad	No national AI strategy is adopted; Chad stated a position at the first UN AI governance dialogue in July 2026. A pre-validation workshop for the National Artificial Intelligence Strategy opened in N'Djamena on 8 October 2026, the strategy aimed at health, agriculture, education and public services. At the first global dialogue on artificial-intelligence governance in Geneva on 6 July 2026 the minister set out a position — artificial intelligence to be ethical, frugal, balanced and sovereign — with a plea for differentiated international cooperation and priority multilateral financing for states with limited digital infrastructure (position). The official declaration the following day records adherence to the 2021 international recommendation and a readiness diagnostic under way, with no adopted national strategy (declaration). The institutional half moved first: a directorate-general for artificial intelligence was created inside the ministry in October 2025 (directorate). Chad has a body before it has a strategy.	MOVEMENT
Comoros	No national artificial-intelligence strategy is adopted or drafted; a readiness evaluation ran to June 2026 and has published nothing. The digital development agency's own account, returning from the Riyadh assembly on artificial-intelligence governance, described the field as at its earliest stirrings in the Comoros, the assembly helping the agency grasp it and advise government on the national measures and strategies to consider. 2026-01 - a diaspora researchers' association used its opening webinar of the year to call on public research and innovation institutions to define a clear national strategy, which is evidence the strategy is still a demand rather than a document. 2026-03 - the telecommunications minister presented a six-month evaluation of institutional, technical and regulatory readiness, due to conclude that June. Its conclusion is not on file.	NO CHANGE
Congo	Drafting began in May 2026 with a technical committee on a six-month mandate and a budget of FCFA 150m to 200m still to be secured. 2026-05-06 - drafting was launched with external support and a technical committee seated on a six-month horizon, eleven deliverables, a budget of FCFA 150m to 200m still to be secured, and a national-languages flagship digitising two languages. Conferences in January 2026 set priorities to feed it; no draft text is held. At 2026-08-06 no deliverable is published and nothing confirms the budget was secured, so a strategy with a six-month mandate has three months of it left and nothing on the record to show.	MOVEMENT
Cote d'Ivoire	The strategy is counted among Africa's adopted national artificial-intelligence strategies, while its named instruments and its costing have not moved. The strategy was handed to the Prime Minister on 13 March 2025, costed at FCFA 912bn with 15 objectives and 109 projects over five years. It is now counted among the continent's adopted national strategies, and six senior implementation posts were advertised from 26 May 2026. No Council of Ministers adoption date or decree is on file and the strategy text is not held. The National Committee for AI and Data Governance, named as one of the strategy's first actions, has no constitution, membership, chair or meeting on record, and the Safe AI label it provides for has no criteria, awarding body or labelled solution. The FCFA 912bn costing still carries no appropriation identified against it. 2026-09-11 - a voluntary national AI pact was signed with the employers' confederation and the chamber of commerce, carrying no financial obligation. 2026-09-30 - the digital acceleration project shortlisted six firms to support implementation of the digital and artificial intelligence compact; the compact's text is not held.	MIXED the strategy is now counted as adopted while the committee, the label and the financing it names have not moved

COUNTRY	DEVELOPMENTS	PROGRESS
Djibouti	The first national artificial-intelligence strategy, for 2026-2030, was presented on six axes on 3 September 2026; its text is not published. None existed at the window's opening; development began with United Nations support, and support was sought from the telecommunications union and a continental body. The strategy was set for official launch at the country's first national artificial-intelligence forum, dated 2 and 3 September 2026 at Djibouti-Ville, the ministry announcing an artificial-intelligence village at the Palais du Peuple framed around domestic developers and researchers and interministerial coordination for it. The forum opened at the Palais du Peuple on the morning of 2 September 2026 under the President's patronage, and on 3 September the strategy's main lines were presented for 2026-2030 on six axes: data and AI governance, cybersecurity, training, research, innovation and inclusion. Its text is not in the repository and no adoption instrument is held.	MOVEMENT
DR Congo	A national AI strategy was validated at a Kinshasa ceremony on 4 August 2026. The Strategie nationale de l'intelligence artificielle and the sectoral digital economy policy were validated at a ceremony in Kinshasa on 4 August 2026, developed with UNESCO support including an AI Readiness Assessment Methodology report. A mixed AI commission had been created by order in October 2025. Validated is not adopted: no decree bringing either instrument into force is held, and neither text was reachable.	MOVEMENT
Egypt	The second-edition strategy for 2025-2030 stands unchanged, with delivery bodies added around it. The second edition has been in force from early 2025 on six pillars covering governance, technology, data, infrastructure, the sector and skills, following a first strategy of 2021 and a responsible-artificial-intelligence charter of 2023, and is restated by the minister without revision. The text is not held, and the country is counted among those regulating artificial intelligence by strategy rather than statute. What was added around it: the council created in 2019 had its remit widened to artificial intelligence, quantum computing and emerging technologies and is preparing a national quantum strategy, with no decree, membership list or rename date held, and a university capacity programme is placed under the strategy. 2026-09-25 - the council adopted the strategy's achievements report for the first half of 2026 and reviewed the outlines of a National Quantum Computing Strategy 2027-2030; no quantum strategy text or adoption date is held.	NO CHANGE
Equatorial Guinea	Artificial intelligence acquired a director-general and a state secretariat before it acquired a policy; the strategy is still in drafting. The institutional layer arrived first, and the ledger carries both offices. What the repository does not hold is an adopted strategy. The forum around it is academic: a second national artificial intelligence forum in May 2026 drew ministry, university and international research participation on artificial intelligence policy, and a sovereign artificial intelligence and data infrastructure collaboration was pitched to the Vice-President at Davos in January.	MOVEMENT
Eritrea	A June 2026 legal-status review records no published national artificial-intelligence strategy (review). A June 2026 legal-status review records the same absence from the legal side: no national artificial-intelligence strategy (review). The repository does hold one AI system in state hands — an agricultural expert system inside a ministry information system — so the absence is of policy, not of the technology.	NO CHANGE
Eswatini	No national artificial-intelligence strategy or statute is held, and two instruments now carry artificial-intelligence rules while neither is an artificial-intelligence instrument. The finding is stated in coverage of the online media guidelines: rules on the technology are arriving inside instruments written for something else (absence). A national fourth-industrial-revolution strategy framed the prime minister's address to a global artificial-intelligence governance dialogue in Geneva (strategy), so the country argues a position internationally on the strength of an instrument that is not about artificial intelligence either. 2026-09-16 — the ICT minister said a consultant has been engaged to draft a national AI strategy; no draft or timetable is published.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Ethiopia	A national artificial intelligence policy adopted in 2024 is in force, known to the repository only at second hand. The policy was adopted in 2024 and its existence reaches the repository through a July 2026 account of the country joining a Shanghai-based cooperation body (policy in force). The policy text, its objectives, any implementation plan and any review are all absent, so what is recorded is that a policy exists and not what it says.	NO CHANGE
Gabon	No strategy has been adopted, and preparatory work toward one closed in Libreville on 30 September 2026 with 22 challenges and 36 recommendations from six working groups supported by the UN development programme; drafting is the next step. 2026-05-22 - the council took a draft decree creating a directorate general of emerging technologies charged among other things with designing and implementing public policy on their responsible use. A timetable, a draft and a directorate at draft-decree stage, and no strategy. The country nonetheless places inside a continental governance ranking's top thirteen on stated commitments, the account itself putting a wide gap between those and what exists. 2026-09-26 - the digital economy ministry and the UN development programme announced the first consultations toward a national strategy, on skills, data, infrastructure, governance, security, innovation and rights; no budget, adoption date or priority use is given. 2026-09-30 - preparatory work for the national AI strategy closed with 22 challenges and 36 recommendations; the ministry and UNDP are next to draft the strategy for government validation.	MOVEMENT
Gambia	The ministry told the United Nations in April 2026 that a national artificial intelligence policy is still in development. The national statement to the science and technology commission is the government's own dated position: the policy is in development, not adopted. The December 2025 budget speech names an artificial intelligence and emerging technology policy and a digital government roadmap among the 2026 priorities, which puts the drafting inside a stated work programme rather than leaving it as an intention.	MOVEMENT
Ghana	The National Artificial Intelligence Strategy 2025-2035 was approved in April 2026 and carries a fund of GHS 5bn scaling to GHS 15bn. The text was published in December 2025 by the communications ministry and is held in full; it gives the range as 2025-2035 and the body proposed as an authority rather than an office. Cabinet approved it in April 2026 and it was launched publicly on 24 April, the President announcing US$250m for a compute centre and US$20m for implementation, neither of which is the strategy's own GHS 5bn fund. A ten-year implementation plan on measurable annual milestones is being built with United Nations partners, with no plan text or milestone list on file. 2026-09-07 - the country is one of 77 to have run UNESCO's readiness assessment methodology, its draft findings stating that the country lacks binding AI-specific regulation and comprehensive data governance frameworks. Three datings of the strategy are in circulation and none is reconciled: the held text is titled 2025-2035 and dated December 2025, a ministerial statement puts Cabinet approval in the week before 26 February 2026, and the readiness report gives it as 2023-2033, approved on 24 April 2026. The frame follows the held text.	MOVEMENT
Guinea	A national AI roadmap for 2026-2035 was validated on 20 December 2025, in three phases. The ICT ministry announced on 20 December 2025 the validation of a national AI roadmap for 2026-2035, following a workshop with UNDP and built on an AI Landscape Assessment diagnostic the ministry says makes Guinea the first francophone country to adopt the AILA methodology. It runs in three phases: institutional, regulatory and technical foundations covering data, skills and infrastructure; progressive integration of AI into public services; then regional positioning on responsible use. The roadmap's own text was not reachable, so its legal status, wording and indicators cannot be read off the instrument, and the announcement itself was made on the ministry's Facebook page.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea-Bissau	No artificial intelligence strategy exists; the subject reaches policy only through misinformation cooperation and a regional framework. Nothing in the repository records a Guinean artificial intelligence strategy, policy or working group. Where the subject appears it appears as risk: specialists debated artificial intelligence, ethics and disinformation at a Bissau forum in November 2025; ministers of Guinea-Bissau and The Gambia pledged joint action as artificial intelligence accelerates the spread of unverified information in June 2026; and a regional framework adopted the same month commits fifteen West African states to information-integrity laws.	NO CHANGE
Kenya	The national strategy's roadmap is costed at KSh 152bn over five years with no dedicated allocation in the FY2026/27 budget. The roadmap was published in February 2026 with an 80 per cent fifth-generation population-coverage target by 2030 (roadmap); the strategy document itself is not held and its publication date is not established (roadmap, costing, governance politics). A 226-page draft policy is out for consultation with a risk-based lifecycle model, effects-based extraterritorial reach, binding worker standards and a disclosure duty, high risk undefined and penalties unstated; it proposes a national council and a safety institute, and a civil-society submission urges institutional independence for the council and mandatory human-rights impact assessments (draft policy, submission, worker standards). A standing Cabinet committee was established on 30 June 2026 to steer the strategy and coordinate policy across ministries, with no membership, meeting record or output published; it reaches the repository through a university analysis rather than a gazette (Cabinet committee).	MOVEMENT
Lesotho	A National AI Policy was signed in June 2026 and a separate National AI Strategy went into drafting in August; neither text is held. The government and the United Nations ran a five-day high-level policy and capacity-building workshop on a national artificial-intelligence strategy and a data centre blueprint (workshop). No strategy text is held. The policy was signed by the communications minister on 12 June 2026, covering responsible artificial intelligence in health, education and public administration (signing, account). Its text is not held, so its scope and commitments cannot be stated. A distinct National AI Strategy was being drafted at a Maseru workshop that opened on 17 August 2026, intended as the framework for deployment; the deputy prime minister's keynote asked for capability assessment, safeguards, infrastructure, policy and human capacity to be settled before investment is widened (strategy).	MOVEMENT
Liberia	An artificial intelligence priority was accepted in principle by the President in July 2026, conditioned on agriculture, transport and commerce applications. No policy, institution, budget line or date is attached, and the proposal came from the President's youth advisory council rather than from the executive (acceptance). It is the only statement of national intent on the technology the repository holds, and it originated outside government.	MOVEMENT
Libya	The prime minister adopted a 2026-2030 National Artificial Intelligence Strategy on 1 June 2026, replacing the 2025-2030 edition published eight months earlier. The first edition, prepared with ESCWA, was published in October 2025 (2025-2030 edition). The 2026-2030 edition was adopted at an official ceremony alongside an ethics charter (adoption). Its targets are stated rather than measured: 80 per cent of government entities using artificial intelligence, 70 per cent activation of the national digital identity, 10,000 staff trained, 100 startups, half of government transactions automated and 70 per cent of paper records digitised (adoption).	MOVEMENT
Madagascar	No national artificial-intelligence strategy exists; the only adopted instrument is an ethics charter binding the courts. A civil-society round table in July 2026 recorded the absence of any national strategy and called for a sovereign policy, noting that the national digital strategy carries no artificial-intelligence chapter (round table). Eighty-five magistrates adopted an ethics charter in June 2026 defining authorised and prohibited uses of artificial intelligence in the courts (charter). A regional summit in May 2026 carried ministerial statements of ambition (summit). What the repository does not hold is any strategy, policy or governing instrument at national level.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Malawi	A draft National AI Strategy has been through validation and a citizen-feedback portal, guided by a readiness assessment validated in July 2026. Regional consultative workshops began in September 2025 and a two-day validation workshop was held in Lilongwe in February 2026; the strategy is pre-adoption with no adoption date on record (workshops, validation, assessment). The readiness assessment was validated in July 2026 to guide it, finding gaps in policy, infrastructure, institutional capacity and education readiness, with 27.7 per cent of the population online against household computer ownership of 4.2 per cent (readiness). It was run by the education ministry rather than the ICT ministry that owns the strategy (regional framework).	MOVEMENT
Mali	A national artificial-intelligence strategy was recommended at the national digital week in August 2026, with no draft published. The recommendation is the whole of the record: no draft, no lead ministry and no timetable is published (recommendation). The country has meanwhile adopted regional artificial-intelligence governance guidelines with five other francophone states and recommended a confederation protocol on the subject, so the governance work is running ahead of any national strategy to govern.	MOVEMENT
Mauritania	A draft National AI Strategy for 2024-2029 sets five strategic priorities, twelve objectives and thirty measures, and no adoption instrument is held. The ministry's April 2024 draft sets five strategic priorities, twelve objectives and thirty measures, covering skills, research, international collaboration, data governance and ethical use, with sector projects in health, education, agriculture, fisheries, transport, energy and defence (draft). A reference guide records a National AI Strategy 2025-2029 as existing (guide); no adoption instrument, budget or implementing body is held, so the country's position rests on a draft.	NO CHANGE
Mauritius	A National AI Strategy and its FAIR guidelines run on six pillars to 2029, with an artificial-intelligence unit from December 2025 and a first innovation lab in August 2026. The guidelines are vendor-neutral and border-agnostic, governing by impact rather than geography (guidelines, launch). The strategy runs 2025-2029 with an artificial-intelligence unit established in December 2025, and a first innovation lab was inaugurated at the cybercity in August 2026 with a memorandum signed at the event; the lab's capacity, funding and access terms are not published (lab).	MOVEMENT
Morocco	An AI Made in Morocco roadmap named since January 2026 was presented as entering implementation on 8 September 2026; no text of it has been published. The roadmap was named at a national event on 12 January 2026, framed there as consolidating the country's 2030 artificial-intelligence programme, and repeated at subsequent signings (launch, seminar). A trade-press account describes ten programmes across trust, infrastructure, data, skills and a national Darija and Amazigh language model at alpha stage (programmes). No roadmap document is on file: every reference is a ministry statement. 2026-09-08 - the ministry presented the roadmap as entering implementation, with targets of MAD 100bn in value added, 50,000 jobs and 200,000 certified talents by 2030, a sovereign AI marketplace and an assistant on the procedures portal. The document is still not published.	MOVEMENT
Mozambique	The National Artificial Intelligence Strategy is in final drafting on five principles and eight sectoral pillars, and was presented to the national association in August 2026. Draft 1 is held: five founding principles including data sovereignty, and eight sectoral pillars structured into short, medium and long-term objectives (draft). Public consultations and provincial workshops are under way and the artificial-intelligence commission is to review before submission to the Council of Ministers; the institute consulted the largest mobile operator at its Maputo premises on 12 August 2026 (consultation, operator). The draft was presented to the national artificial intelligence association later in August, described as still under development through open multi-sector consultation; no adoption date, budget or governance instrument is stated (presentation).	MOVEMENT not adopted

COUNTRY	DEVELOPMENTS	PROGRESS
Namibia	A national artificial-intelligence strategy is in development through the research council working group, guided by a completed readiness assessment. Consultations began under the council's working group and its technical advisory committees; no draft is published, and the ministry states the strategy is sequenced ahead of legislation (strategy, framework, coordination). The working group is a multi-stakeholder platform with science, data and skills committees and runs the national strategy process (group). A readiness assessment was completed by the council with the education ministry and an international body, and its findings were restated by the authors in February 2026; the report itself is not held (assessment).	MOVEMENT
Niger	A national artificial-intelligence and data-governance strategy is in preparation, with expert recommendations gathered and no adopted text. The government stated its intent to elaborate the strategy on 29 July 2025, naming education, health, agriculture and natural-resource management as target sectors and the data protection authority and information society agency as co-organisers. A national colloquium on 23 September 2025 gathered sixty experts whose recommendations were to feed the strategy, and the information society agency took part in a regional artificial-intelligence workshop at Dakar on 29 and 30 January 2026, exchanging with Senegal's digital ministry and statistics agency on national strategy and data-governance approaches. No draft text, timetable or adoption date for the strategy is on file.	MOVEMENT
Nigeria	The National AI Strategy is still in development with its Trust approved, while the country ranks 38th of 135 on a responsible-AI index and Africa's highest. The National AI Trust was approved by the Federal Executive Council in February 2025 to mobilise resources and provide oversight, building on a 2024 draft strategy and the national artificial-intelligence research centre; the strategy itself is still in development (trust). The country scores 45.93 and 38th of 135 on the 2026 responsible-AI index, Africa's highest, and 72nd on a government readiness index against 141st three years earlier; the responsible-AI index's own conclusion is that holding policies is not the same as enforceable oversight or deployed systems, and both are composite scores built largely from policy documents (indices).	MOVEMENT
Rwanda	A national artificial-intelligence policy was approved by cabinet in April 2023, and a national agency was approved in June 2026 with no establishing instrument published. The policy has been in force since April 2023 and is the instrument every later commitment is read against (policy, outlook). Cabinet approved a dedicated agency in June 2026 and a coordinating mandate for shared compute was stated in August; software developers and early-stage startups welcomed it in the national press and set out what they want from it, compute and infrastructure improvements and expanded room for commercialisation. That is a statement of the gaps the sector reports rather than of the agency's remit: no establishing instrument, budget, staffing or timetable is held, so the repository cannot say whether any of it falls to the agency at all (agency, startups, gaps).	MOVEMENT
Sao Tome and Principe	There is no national AI strategy; the readiness assessment puts approval of an AI law at 2027 or 2028 and rates it low priority against four legal updates it rates high. The assessment's roadmap puts approval of a National AI Strategy Law at 2027 or 2028 at low priority, arguing the instrument must be a law because personal-rights matters are reserved to the National Assembly, and rates four updates high priority for 2024 or 2025 instead: the data protection agency's 2017 organic law, the 2008 decree creating the innovation institute, the 2020 resolution adopting the digital governance strategy, and the statistics institute's capacity (roadmap). The education minister's preface states the country is not prepared to implement artificial intelligence ethically, having neither a strategy nor an AI-specific law nor a national AI ethics commission (preface); a later country profile drawn from the same assessment restates the absence (profile). What has happened instead is training: a two-day intensive on digitalisation and artificial intelligence for the public administration ran in April 2026, financed by a bilateral agency (training). Preparation is under way and the instrument is not.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Senegal	A national artificial-intelligence strategy was adopted in 2023 on six orientations, and a head-of-state instruction now calls for a development plan whose relation to it is unestablished. The strategy was adopted in 2023 on six orientations. It predates the reporting window so it is not movement, and its first appearance corrected an earlier record that had held there was no published strategy at all (strategy). A council of ministers communiqué records a head-of-state instruction for a national development plan, and whether it supersedes, implements or replaces the 2023 strategy is unestablished (instruction). A readiness assessment records an ethics committee as planned; the assessment is dated 2025 with no month and the full report is not held (committee). 2026-09-15 — Oxford Insights' 2025 index scored government AI readiness at 46.10, 97th in the world and first in UEMOA.	MOVEMENT
Seychelles	A national science, technology and innovation institute was established by Act with an artificial-intelligence strategy mandate, and the body was reinstated under the Vice-President while no commencement notice for the Act is on record. The Act was assented in December 2025, establishing a body corporate with an artificial-intelligence strategy mandate, a science academy, an open-access scientific-data repository and incubation centres (Act). The institute was reinstated with its secretariat under the Office of the Vice-President and is described as functioning; no commencement notice for the Act is cited anywhere (reinstatement). A body operating under a statute whose commencement cannot be evidenced is worth stating plainly. No artificial-intelligence strategy has been produced under the mandate; what exists instead is an education framework, recorded separately.	MOVEMENT
Sierra Leone	A National AI Strategy is in development, with a draft readiness diagnostic produced and consultations run. The draft diagnostic and the consultations are what the repository holds; no strategy text, timetable or adopting decision is on record (strategy). What exists instead is an artificial-intelligence-in-government partnership already delivering training, and a public awareness campaign on deepfakes. Both are recorded separately, and both run ahead of the strategy that would frame them.	MOVEMENT
Somalia	A national artificial-intelligence readiness assessment gained a university participant in August 2026, with no methodology, participant list, score or publication date stated. The university joined the assessment in August 2026 (assessment). Nothing about the exercise is published beyond the fact of it. A readiness assessment is the usual first step toward a strategy, and no strategy, policy or guidance on artificial intelligence exists in this repository for the country.	MOVEMENT
South Africa	The draft national AI policy was withdrawn in April 2026 over fabricated academic citations, the seven institutions it proposed are under reconsideration, and cabinet has slipped to November 2026 or January 2027. 2026-04 — the draft national policy, released for comment on 10 April 2026, was withdrawn after AI-hallucinated citations were found in its reference list. Two officials were on precautionary suspension as at 19 August 2026. 2026-05-12 — an expert panel was appointed to advise the redraft. 2026-07-29 — the department stated the replacement will issue national guidelines rather than prescribe rules to industry, and that the seven proposed new institutions are being reconsidered. Parliament's communications committee prefers strengthening the existing regulators through the ICT and Media Regulators Forum to creating them. 2026-05-27 — cabinet consideration moved to November 2026 with January 2027 as the fallback. South Africa has no gazetted national AI policy framework, and the instrument that was in the window went backwards rather than forwards. A survey of Eastern Cape schools found 4 per cent with an artificial-intelligence policy, while 48 per cent of South African teachers already use the tools (survey). 2026-10-03 - the deputy minister said the redrafted policy is due for ministerial input by the end of November 2026 and at cabinet by the end of 2026/27.	REGRESSED

COUNTRY	DEVELOPMENTS	PROGRESS
South Sudan	No national artificial-intelligence strategy, policy or programme is held, and the ministry named infrastructure, a data centre and skills as prerequisites in April 2025. The undersecretary's statement of prerequisites is the whole of the record (prerequisites). Naming a data centre as a prerequisite is consistent with the rest of this ledger, where the national facility's own construction status is contested between two ministerial accounts and no procurement record exists.	NO CHANGE
Sudan	A Data and Artificial Intelligence Authority was established by decree ahead of any primary data-protection law, and no strategy, sandbox or guidance note is held. The authority was created by the same decree as the other two, and it was created before the country had a data-protection statute (authority). No artificial-intelligence strategy document, regulatory sandbox or guidance note is held for the country, unlike several other African states the same roundup records (roundup). A regulator standing up before the law it would enforce is a sequencing choice, and the draft that would supply the law is recorded separately as still in redrafting.	MOVEMENT
Tanzania	The ICT Commission said in September 2026 that the National AI Strategic Framework 2026-2031 is awaiting approval, after the ministry called the strategy completed in March; no text is published. The ministry's permanent secretary said in March 2026 that the national artificial intelligence strategy was completed and would provide governance and oversight of the technology, and Tanzania's own July 2026 statement to the United Nations global dialogue describes an implemented national strategy framework of 2026. Independent assessments published at the end of July still record no adopted national instrument, with work proceeding off existing digital, data-protection and science frameworks. No strategy text is held from any source, which is what would settle it. The government's own statement acknowledges that liability and oversight rules remain to be developed whatever the strategy says. The one sectoral AI instrument held is the education ministry's National Guidelines for Artificial Intelligence in Education, issued January 2025 under the National Digital Education Strategy 2024/25-2029/30, held in full as published. No implementation report, school count or review date under them is held. 2026-09-29 - the ICT Commission's head of ICT development said the National AI Strategic Framework 2026-2031 is awaiting approval, and that the commission proposes a readiness and compute-demand assessment feeding a planned AI observatory. The government's own accounts now describe a framework drafted but not adopted.	MOVEMENT a framework drafted and awaiting approval, with no text published
Togo	No adopting act for a national artificial-intelligence strategy has been located, and two official statements disagree about whether one exists. At a ministry event of 13-15 November 2024 the digital economy minister stated it was necessary for Togo to have a national artificial-intelligence strategy, so none had been adopted at that date. A justice ministry symposium of 25 November 2025 gathered more than fifty state and institutional actors on artificial intelligence in public governance and closed by recommending regulation of digital platforms on ethical grounds. A government report of July 2026 then refers to the national AI strategy of Togo as an existing framework without naming an adopting act. No such act is held. 2026-09-21 - the education ministry presented a drafted national policy on artificial intelligence in vocational training to a regional workshop, to be enriched by its close; it is a sectoral policy and does not settle whether a national strategy exists.	NO CHANGE
Tunisia	Outlines of a national artificial-intelligence strategy were presented to a restricted ministerial council in August 2026 and drew a published sovereignty critique, and the strategy text is not held. The outlines went to a restricted council on 16 August 2026 and a critique appeared the next day; a publications ranking circulating alongside it is a research-output measure and not evidence of state capability (outlines, critique, ranking, council). A white paper on artificial intelligence was published open source by a diaspora association and presented at a global forum (white paper, forum). The country chairs an Arab working group on artificial-intelligence innovation while its own strategy is at outline stage and unpublished.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Uganda	A National AI and Emerging Technologies Strategy holds the same status at both ends of the window, while an AI secretariat operates with no budget line or mandate document held. The strategy was reported in development in June 2025 and again in August 2026 as due by the financial year's end; the same status at both ends of the window is the finding (strategy, outlook, crafting, policy, rights). A ministry secretariat is reported operating under a named head with no budget line, staffing figure or mandate document held (secretariat). A separate policy to regulate artificial intelligence and social media was announced to an editors' guild meeting; it is distinct from the strategy and the repository holds no other record of it (media policy). 2026-09-10 - a strategy is stated to be in development, aimed at building national capacity to develop, govern and benefit from artificial intelligence rather than depending on foreign systems, the science and technology minister naming data, computing infrastructure, energy, models, applications and skills as what must be invested in. No draft, publication date, budget, lead institution or consultation process is named.	NO CHANGE
Zambia	The National AI Strategy text was located in the copy lodged with an international policy observatory, and the ministry says the strategy is nearing the end of its cycle and due for review. The document carries no date of its own — no adoption date and no month in 121,000 characters of extracted text — and is dated here from the ministry's own launch announcement (text). It disagrees with itself about its horizon: the cover reads 2024-2026 and every running header reads 2025-2027. No first-party copy was located (text). The permanent secretary said in August 2026 that the strategy is nearing the end of its cycle and due for review; a successor reading is an inference from the dates and is stated in no source held (review, partnership, leadership). A regional artificial-intelligence strategy sensitisation workshop was launched in the capital: the country is drafting a national instrument while helping shape the regional one that would frame it (regional).	MIXED a strategy text located and held while the document carries no date of its own and disagrees with itself about its horizon
Zimbabwe	A National AI Strategy 2026-2030 was approved by Cabinet in October 2025 and launched by the President in March 2026, and the strategy text is now held in full. Trade press reported six pillars where the document sets out four strategic pillars inside a six-pillar implementation frame (strategy, launch, penetration, lessons). A National AI Council is named in the strategy as the critical first step and remains planned (council), and an implementation office is provided for in the ICT ministry, funded from the Treasury and the regulator-managed universal service fund (office). The strategy carries its own account of its consultations, closing at a provincial centre in September 2025; that record is the strategy's account of itself (consultations). Every institution the strategy creates is still planned.	MOVEMENT

Data localisation policies

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	In-country data localisation was mandatory as at September 2024. Localisation was recorded as mandatory in September 2024, and an April 2026 analysis of digital-sovereignty policy set out the data-protection law that governs data storage and transfer. The instrument imposing it is not itself held. No later instrument, implementing text or enforcement decision on localisation is held.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Angola	No general localisation rule. Transfers out are authorised case by case; the sectoral hosting rules are the central bank's and the credit-bureau regulation's. Angola has no statute or decree requiring public or personal data to be held in the country. What it has instead is a permissioning regime: the data-protection agency publishes no list of countries it regards as adequate, assesses adequacy case by case under article 33 of the 2011 law, and requires a fresh notification whenever the authorised conditions change. Every transfer out is therefore an individual authorisation. Two sectors go further. The central bank's 2020 notice on cyber security and cloud computing sets the conditions on which financial institutions may place data with a cloud provider. The national policy for managing and hosting public data is the instrument that might one day generalise it. Credit bureaux are the second: the 2020 regulation of private credit information centres requires primary processing and replica sites in Angola at least 30 km apart, and allows cloud storage and cross-border sharing only with the data-protection agency's prior authorisation.	NO CHANGE
Benin	A data-localisation law is committed in the presidential programme, with no draft, scope or timetable on file. 2026-03-21 — the presidential programme for 2026 to 2033 commits to a data-localisation law. None existed before it and no draft, scope or timetable has followed in the five months since. The commitment sits beside two live positions it would bear on. The generative-artificial-intelligence regime reported under government use already forbids transfer of administration data to extraterritorial jurisdictions by contract, and concedes that contract does not close the risk. And the national data centre reported under storage has no published capacity, so what a localisation duty would be satisfied against is not established.	MOVEMENT
Botswana	The minister stated an intention to compel businesses to store data in Botswana; no bill, draft or date is on file. 2025-11-25 — at the launch of the national data centre the minister announced an intention to amend the Data Protection Act to compel businesses to store data in Botswana. No bill, draft or date has followed in the nine months since, and nothing of the kind was proposed before. The Act as in force already permits transfer subject to approved-country limits and an in-country copy, so the announced amendment would replace a conditional regime with a compulsory one. The capacity to absorb it now exists: a certified national data centre and a private facility are reported under data storage, and government migration into the first is under way. What is missing is the instrument.	MOVEMENT
Burkina Faso	A prime-ministerial circular directs state bodies to favour national hosting and is applied when hosting requests are assessed, and large firms must build headquarters in-country. 2026-03-03 — a prime-ministerial circular directing state bodies to favour national hosting is named as the operative instrument and is applied when hosting requests are assessed, since local hosting does not appear explicitly in the platforms decree. Neither the circular's date, number nor text is held, so the country's central localisation rule reaches this repository only as a description of itself. 2026-02-12 — a decree requires firms above a revenue threshold to build headquarters in-country, with building standards set by revenue band. It is the built-environment counterpart to data localisation and it reaches the three mobile operators. The doctrine is being executed rather than legislated: the repatriation of 120 externally hosted platforms, reported under data storage, runs on a circular nobody can read.	MOVEMENT
Burundi	A regional regulatory profile records no national framework on cross-border data transfers and no measure restricting them. The digital trade regulatory profile states that Burundi has no national legal framework on cross-border transfers of data and no measures restricting them, including on the location of data, local storage, bans on data transfers or local processing requirements. The finding is a stated absence rather than a gap in the record, which is the more useful of the two. Two caveats travel with it: the profile carries no printed publication date and its underlying regulatory survey runs only to December 2021, and the personal data protection law promulgated in March 2026 is an image-only scan, so whether it introduced a transfer or localisation rule cannot be read from the repository.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Cameroon	Operators secure over 73% of the country's domains domestically against a national target of 98% by 2026. 2025-12-10 to 12 - the state operator stated that operators including itself secure over 73% of the country's domains domestically against a national target of 98% by 2026, and put revenue from its data-transport activities above FCFA 33.7bn in 2024, more than 17% up on 2023. The figures are the operator's own. No localisation instrument, obligation or exemption regime sits behind the target, no independent measurement of it has been published by the regulator or the agency, and nothing states what happens if it is missed.	MOVEMENT
Cape Verde	No instrument requires public data to be stored in the country; what exists is a routing rule, that all data interoperability between state institutions must go through the state data-exchange platform. The health ministry's own procurement terms state the rule: the data-exchange platform is the State's principal integration and interoperability platform and all data interoperability between state institutions must go through it, any API handling personal data requires authorisation from the data-protection commission, and the authentication platform is the one an application must register with as a service provider. That is a routing rule, not a localisation rule. No government cloud, hosting or data-localisation instrument is held, and nothing states where public data physically sits.	NO CHANGE a standing position the repository holds for the first time
Central African Republic	No localisation rule. Transfers out are governed by the 2024 personal data protection law, whose supervising authority is still only planned. No instrument requires data to be held in the country. The transfer question is answered by statute: the 2024 personal data protection law carries a cross-border transfer regime, resting on the constitutional right to privacy. The authority that would administer it does not yet exist, and the hosting it would govern has nowhere domestic to sit: the tier-three data centre is planned rather than built and the cloud strategy is planned. A localisation rule would at present have no facility to point at.	NO CHANGE
Chad	No data-localisation rule exists; the digital code drafting committee is the one instrument that could carry one, and it states none. A new drafting committee for the digital code was installed on 6 May 2026 with thirty days to report — a shorter deadline than the forty-five days reported of the April 2026 committee, which the repository has not reconciled — and the account states no localisation or local-hosting provision (committee). The code was still an avant-projet in February 2026, its drafting funded through the state fibre project (workshop). The nearest thing to a residency rule is directional rather than legal: the national data centre is built and awaiting certification (centre), which is capacity, not an obligation to use it.	NO CHANGE
Comoros	No localisation requirement exists: the 2014 law conditions transfer abroad on the destination state's level of protection rather than barring it. The law's own text, now on file, settles what the regime is. Article 9 lets a controller transfer data to a foreign state only where that state assures a sufficient level of protection, judged on its rules in force, its security measures and the purpose, duration, nature, origin and destination of the processing - an adequacy test, not a storage rule. Article 43 makes transfers abroad one of the categories requiring prior authorisation, and article 45 requires any declaration to state them. Both controls run through a commission that has never been constituted, so the adequacy test has no body to apply it. Nothing on file requires data to be held in the country, and no sectoral circular does either.	NO CHANGE
Congo	The 2019 personal data protection statute is the standing instrument. No data localisation policy is adopted. Loi 29-2019 on the protection of personal data is the standing instrument, and it is a protection statute rather than a localisation one. No requirement to hold data within the country, and no exception regime for transferring it out, appears anywhere on this ledger at either end of the period.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cote d'Ivoire	The national data governance strategy states a copy of data generated in the country will be stored in the national cloud or data centre; no rule enacts it. The strategy's infrastructure pillar states that a copy of data generated in the country will be stored in the national cloud or the national data centre, classes critical data as essential to national sovereignty and the protection of vital infrastructure, and sets 2026 for the data centre to be installed and operational and a national cloud to be in place. That is a strategy commitment. No decree, regulation or contractual clause enacting a localisation requirement appears on this ledger, and the data centre it depends on has no published completion date. The one localisation rule the repository does hold is narrower and older: the civil-status decree permits delegation of hosting and backup to a private body only where that body is established and hosting on Ivorian territory.	NO CHANGE a strategy commitment with no instrument behind it
Djibouti	The Digital Code, with its personal-data book, was published in September 2025; its transfer articles are not held, so no localisation rule can be stated. Nothing was in force at the period's opening. The Digital Code was published in the Official Journal on 18 September 2025; its articles 99 to 103 on international personal-data transfers are not held, so whether they require domestic storage is not established. No implementing decree, adequacy list or authorisation decision under those articles is held, and the data-protection commission the Code creates has no constituting decree on record - so the body that would operate the regime is not evidenced.	MOVEMENT
DR Congo	The rule is a hosting duty: the law requires all public-administration data to be hosted in the state data centre, and some data still sits on private servers. The government's own account of the state data centre records both halves of the position: the law requires all public-administration data to be hosted there, and some data nonetheless still sits on private servers. No compliance figure, migration plan or enforcement action against that duty is published, and the instrument imposing it is not itself held. The replacement named for it is a sovereign government cloud, listed as an existing ministry project alongside the digital and data strategies, the identity platform and a certification authority, with no hosting location, operator, procurement, budget line or date. No rule reaches private-sector or personal data at all: nothing states where a bank, an operator or a platform may hold data on Congolese residents.	NO CHANGE a standing position the repository holds for the first time
Egypt	Data classified top secret or secret must be hosted exclusively within Egypt, in force since August 2024. The Cloud First Policy's localisation requirement entered into force on 22 August 2024, mandating that data classified top secret or secret be hosted exclusively within Egypt, after adoption on 13 March 2024. A policy tracker records it as an executive order of central government at national level, applying to cloud computing, storage and database infrastructure providers. The policy itself puts the requirement more broadly, committing the state to localising data related to national security and to relying on licensed and compliant providers, with data classification the step that decides what may leave. Nothing has moved on it since. No enforcement mechanism, certification scheme for compliant domestic hosts, or count of workloads repatriated under it is published, and no sectoral localisation rule outside the classified-data case is held - which sits against a national data-centre strategy framed around localisation and digital sovereignty that has not been published.	NO CHANGE a first stated position with no earlier account behind it
Equatorial Guinea	The 2015-2017 electronic laws cover data protection and retention and set no localisation requirement. The five laws published together in the official bulletin run to data protection, data retention, electronic signature, electronic access and internet communications. None requires data to be held in the country. Hosting is instead a procurement question: the national data centre stood up under the administration computerisation programme and a backup site is at works stage, with no rule saying what must go into either.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	No localisation or residency rule is held. Domestic hosting happens anyway, because the only provider-hosted cloud on the repository is the state operator's own. No instrument states where public or personal data may be held. There is no hosting duty on public bodies, no rule on transfers out and no authority that could grant or refuse one, the data-protection law itself being absent. What produces localisation in practice is the shape of the market rather than a rule. The state operator's private cloud is hosted in its own data centres, and no foreign provider is recorded serving the country. Data stays where it is because there is nowhere else for it to go, which is not the same position as a country that has chosen it.	NO CHANGE
Eswatini	No localisation policy is held. The Data Protection Act governs transborder flow, and a 2025 directive makes controllers record where data is stored. The Act's Part V governs the transborder flow of personal information and is the closest instrument to a localisation rule; the repository holds no standalone localisation policy (Act). The data protection authority directed in September 2025 that every controller and processor, public bodies included, map and inventory its data — flows, storage location and sharing — with returns due by 31 March 2026 (directive). At the opening of the national data policy workshop on 29 April 2026 the ICT minister said the policy aims to make Eswatini one of the safest places in the world to store data (workshop). A stated ambition to attract storage is not a residency rule, and no compliance count for the mapping directive is held.	MOVEMENT
Ethiopia	The security agency announced a home-grown government cloud framed expressly as implementing data localisation (announcement). The Information Network Security Administration announced Gotera Cloud, a home-grown government cloud offering infrastructure, platform, software and backup services, framed expressly as implementing data localisation and data sovereignty (announcement). The Council of Ministers approved Digital Ethiopia 2030 in November 2025, a strategy centred on sovereign national cloud and domestic data governance (approval). The repository holds an infrastructure build and a strategy commitment, and no rule: nothing on the record requires any class of data to be stored in Ethiopia, and the data protection proclamation's cross-border provisions are not framed as localisation.	MOVEMENT
Gabon	The rule is in the cybersecurity statute: data judged confidential or sensitive must be held in country. Against it, about 95 per cent of data produced in the country is hosted outside it. The 2023 statute is the clearest binding data-residency instrument located: data judged confidential or sensitive must be held in country. Its text was not held before this pass; the duty has been in force for three years. The facility that would receive the data opened three years after the rule: the first national and sovereign data centre was inaugurated in the special economic zone on 3 July 2026. Between the two sits the measurement: about 95 per cent of data produced in the country is hosted outside it. No compliance figure, migration plan or enforcement action under the residency duty is published.	MOVEMENT
Gambia	The only localisation rule is the unsigned cloud policy's draft data-sovereignty and classification provision. The cloud policy sets a draft data-sovereignty rule and a classification scheme for government workloads, and has not been signed. Nothing else in the repository states where Gambian government or personal data must be held. Practice has run ahead of the rule: the identity data centre inaugurated at Abuko in June 2026 hosts the national identity system inside the country, which is localisation by procurement rather than by instrument.	NO CHANGE
Ghana	A 125-section draft Act would repeal the 2012 statute outright and require domestic storage of data critical to national security, civil registration and sensitive personal data. The draft text is now held in full. It would establish a Data Protection Authority and repeal the Data Protection Act 2012 (Act 843), replacing the Commission constituted under it, and covers civil registration data and sensitive categories including children's, biometric, health and genetic data. It carries no month within 2025 and no commencement date, and no localisation instrument is in force.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	A study on public data hosting and a sovereign cloud was presented in Conakry on 23 May 2026. No migration obligation, timetable or legal instrument follows from it. 2026-05-23 - the state digitalisation agency held a restitution session on a World Bank-supported study into the hosting of public data and the development of a sovereign cloud, attended by the digital economy ministry, the cybersecurity agency, the telecommunications regulator, the broadband company, the electricity utility, the central bank and the tax directorate, covering data centre infrastructure, cybersecurity, resilience of state information systems and cloud governance. It is a study restitution, not an adopted rule. The infrastructure the question turns on exists: the national data centre is in service and certified, and the presidency states that strategic state data had previously been hosted abroad at about USD 5 million a year. That is a stated motive for localisation and not an instrument requiring it. A national data governance strategy is being drafted, covering data quality, security, interoperability and responsible use, with no adoption date stated.	MOVEMENT
Guinea-Bissau	No localisation rule exists; the only hosting question on the record is the national cloud the feasibility study scopes. The data governance and protection policy approved by cabinet in September 2025 is the instrument that would carry a localisation rule, and nothing in the repository records one inside it. What is being planned is capacity rather than restriction: the feasibility study scopes a national cloud and the 2026 budget names a data centre. Neither says what must be held in it.	NO CHANGE
Kenya	No localisation requirement is held; the 2021 general regulations and cross-border guidance govern transfers instead. The general regulations under the Data Protection Act have been in force since January 2022 and are the operative subsidiary instrument (regulations). The Data Protection Commissioner issued guidance notes for the public sector in 2025, applying the data-protection principles to public bodies and their processing (guidance). The regime regulates transfers abroad rather than requiring local storage; a sovereign cloud market has grown up beside it commercially rather than by mandate. No instrument requiring state or personal data to be held in country is held.	NO CHANGE
Lesotho	No localisation or residency rule is held; section 52 of the Data Protection Act governs cross-border transfer instead. 2012-02-22 — the Act's section 52 governs cross-border transfer of personal information, the closest enacted instrument to a residency rule. 2025-10-14 — a validation workshop aligned the draft data management policy with the African Union data policy framework. 2026-02-20 — the ministry's ICT director said the policy was on the verge of being finalised, four months before it was signed. No rule requiring government or personal data to be held in Lesotho is on the record.	MOVEMENT on a general data policy rather than a residency rule
Liberia	Section 9(c) of the 2020 payment regulations is the only localisation rule, and it carries an offshore escape clause. The regulations gazetted 8 January 2020 state that a licensee's payment system should be hosted locally, and that where it is hosted abroad the licensee must supply requested information promptly and give the central bank unfettered access. That is a sectoral norm with an escape, not an economy-wide regime. The repository holds no general data-localisation instrument, and the National Data Policy that might carry one was still in multi-stakeholder drafting in November 2025.	NO CHANGE
Libya	Circular 18 of 2025 bars all cross-border transfer of Libyan banking data and requires certified in-country hosting. The central bank's regulation is the strictest localisation rule the repository holds for Libya: banking data may not leave the country, hosting must be certified to international information-security and card-industry standards, and breaches carry a penalty of LYD 100,000 each. It is sectoral. No economy-wide localisation instrument exists, and the national digital agenda records the general data protection law as still unenacted.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Madagascar	No localisation rule is held; the 2014 data-protection law governs transfers abroad and its commission was constituted in 2025. The founding statute of 2014 regulates transfers of personal data abroad rather than requiring local storage (statute). The supervisory commission that would administer such transfers became operational in August 2025 (operationalisation). Government data-centre construction proceeded in parallel, with safeguard documents for both national sites published in April 2026 (safeguards). The repository holds no instrument requiring state or personal data to be held inside the country, and none of the data-centre documents states a hosting rule.	NO CHANGE
Malawi	No localisation requirement exists: Part VII of the 2024 Act conditions transfer abroad rather than requiring local storage. The Data Protection Act 2024 regulates cross-border transfer of personal data at sections 38 to 40 rather than imposing a blanket localisation mandate. Searched at 29 August 2026, no sectoral circular, licence condition or hosting rule on file requires data to be held in the country. 2025-10 - regulations on the engagement of data processors were published, which is where an outsourced or offshore processing arrangement is governed if it is governed anywhere. 2026-07 - the regulator consulted stakeholders on draft regulations and registration fees for significant controllers and processors. None of it turns on where the data sits.	NO CHANGE
Mali	No localisation rule, but the state announced progressive repatriation of Malian public data held abroad when the data centre opened. Mali has no statute or decree requiring data to be held in the country. What it has is an intention stated at an opening: on inaugurating the tier-three centre the minister announced a progressive repatriation of Malian public data currently hosted abroad, framed as digital sovereignty. The rule that would give it effect is still a recommendation from the same digital week. Personal data remains governed by the 2013 protection law, administered by an authority whose 2026 second session opened with 1,000 files. Nothing states where public data must sit.	MOVEMENT
Mauritania	Using cloud services hosted abroad for personal data requires prior authorisation from the data protection authority under the amended deliberation of April 2026. The amended text of deliberation 005/2025, published 30 April 2026, requires public and private bodies using cloud services abroad to obtain prior authorisation for the processing, a separate transfer authorisation where the host country is not on the approved list, and contractual guarantees covering compliance with the 2017 law, a data-transfer clause, return of the data on contract expiry and its permanent deletion by the provider (deliberation). The authority has also taken up homologation of the national data centre at its monthly meeting (hosting). No general localisation requirement, sector rule or list of authorisations granted is held, and the approved-country list the regime turns on is not published.	MOVEMENT
Mauritius	No localisation rule is held; the 2017 Data Protection Act governs transfers, and sovereign cloud is a procurement rather than a policy. The Act of December 2017 is the governing instrument and regulates transfer abroad rather than requiring local storage (Act). A sovereign cloud for government is being market-sounded (clarification), and the 2026-2030 fintech strategy sets out where financial data is expected to sit (strategy). Neither is an instrument requiring state or personal data to be held in country, and none is held. Sovereignty here is being bought as infrastructure before it is written as rule.	NO CHANGE
Morocco	Sensitive data must be hosted exclusively on national territory, a cloud qualification decree awaits its implementing order, and a classification guide sets the categories. Law 05-20 article 11 mandates exclusive national hosting of sensitive data and article 49 sets a fine of MAD 200,000 to 400,000, doubled on repeat, while article 53 defers force to implementing texts and the definition of sensitive data sits in an unheld decree (law). Decree 2-24-921 was gazetted in February 2025 and is not in force: neither the qualification order nor the list of qualified providers is held, and level-2 qualification would require processing and storage exclusively on national territory and Moroccan majority ownership (decree). A national data classification guide categorises data by sensitivity and requires sensitive data to be stored domestically; its own text, issuing body and date are not held (guide).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mozambique	Data centre and cloud regulations were approved by decree at the end of 2025, above a 2003 central-bank notice already requiring data centres to sit in the country. The regulations were approved by Decrees 71/2025 and 72/2025, both of 31 December 2025, subject to a ninety-day vacatio legis, and carry provisions on data centres located abroad and on storage of information classified as state secret (decrees). Operators running on the date of entry into force have one year to comply, and a data-centre operator licence waives the requirement for a separate cloud-computing licence (decrees). The decree texts themselves are not held. The consultation drafts required registration of any data-centre operator whether or not the facility is in Mozambique, a resident legal representative for foreign providers, four resilience categories, financial-sector data confined to the two highest and classified information confined to private clouds on national territory (drafts); whether those provisions survived into the decrees is not established. 2026-08-31 - the central bank gazetted a notice requiring banks' primary data centres and principal systems in national territory, replacing the 2003 rule, in force 60 days on.	MOVEMENT
Namibia	No localisation policy is held. The cloud determination obliges banks to check their providers against residency requirements, and binds nobody else. The central bank's determination requires banking institutions to ensure cloud service providers adhere to data protection law including data residency requirements and privacy standards (determination). It binds banks, not government, and the capture is truncated. The statute that would carry a national rule does not exist: the Data Protection Bill was promised for tabling in September 2025 and was described in January 2026 as under final polishing (tabling, polishing). The national data centre that would give government somewhere domestic to host is funded and unbuilt (budget). A country with no data protection Act has no instrument in which a residency rule could sit.	NO CHANGE one sectoral residency clause and no national rule
Niger	No localisation rule. Transfers sit under the 2022 data protection law, whose supervising authority was suppressed in June 2026. Niger has no instrument requiring public or personal data to be held in the country. What governs the question is the consolidated personal data protection law, as amended by a 2023 law and two 2024 ordinances, which conditions processing and transfer on the protection authority's supervision rather than on where the data sits. That supervision is what changed. The authority was suppressed in June 2026, leaving a law with declaration, authorisation and sanction powers and no body to exercise them. The position on where data may be held is therefore not merely unstated but unadministered, and the national data centre nearing completion will come into service without a hosting rule above it.	REGRESSED
Nigeria	A central bank circular requires payment data generated in Nigeria to be stored there by 1 January 2027, against more than 85 per cent of workloads on public clouds. The circular requires payment transaction data generated in Nigeria to be stored and managed in Nigeria by 1 January 2027, with ultimate beneficial ownership disclosure and market-concentration caps; the circular text itself is not held (circular, directive, dilemma). An analysing firm estimates US$850m a year spent on offshore data hosting and about 90 per cent of Nigerian payment data currently held abroad (analysis). More than 85 per cent of Nigerian workloads sit on public clouds and 22 per cent of the thousand most-accessed sites are hosted locally against a 34 per cent sub-Saharan average (dependence); the concentration risk is an expert's characterisation rather than a measured exposure (dependence, costs). 2026-09-10 - the central bank's payment-system supervision director said further implementation guidance is being prepared on what counts as payment data and on hybrid and cross-border processing, ahead of the 1 January 2027 deadline. 2026-10-04 - cloud providers said some institutions may keep applications abroad while hosting payment data in the country, which the central bank has not ruled on.	MOVEMENT
Rwanda	The rule is conditional, not absolute: articles 48 to 50 of the 2021 data protection law set in-country storage by default with authorised external transfer. The statute enacted in October 2021 establishes storage inside the country as the default and permits external storage and transfer subject to authorisation (law). That is a conditional localisation rule rather than a blanket mandate, and it is administered through the data protection supervisory authority's registration regime. The shared data hub's hybrid specification — on-premise core, cloud for scalable workloads — is the first procurement document that has to answer the question in practice (minutes).	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Sao Tome and Principe	The identity institute states that hosting the country's vital systems in national territory is an imperative of security and sovereignty, and offers the hosting service itself. The institute's own service page states the sovereignty position and adds that the personal data protection law restricts hosting personal information outside the country; it offers hosting to the whole public administration and invites private bodies to use it (hosting). That is a stated position and a service, not a binding localisation rule: the page is undated, no instrument setting a residency requirement is held, and the restriction it cites is a transfer condition in the data protection law rather than a localisation mandate. The data protection authority named international data transfer among the priority themes of a new Lusophone regulators' network in August 2025, which is cooperation rather than a national rule (network).	NO CHANGE
Senegal	A 2021 presidential instruction requires state data to be hosted in the national data centre; no economy-wide obligation exists. At the national data centre's inauguration on 22 June 2021 the President instructed the government and all state structures to host all state data and platforms there, and to migrate rapidly data held abroad or in premises not meeting international standards. The directive covers public-sector data. No general economy-wide obligation to host data in Senegal was found, the 2008 personal data law regulating cross-border transfers rather than requiring domestic storage. The target that would extend it sits in the technology strategy rather than in an instrument: 100% of sensitive data hosted in Senegal by 2034.	NO CHANGE
Seychelles	No localisation rule. Transfers out are conditioned by the 2023 data protection act, whose regime the regulator is now turning into guidance. Seychelles requires no data to be held on the islands. What it has is a conditional transfer regime: the 2023 data protection act, whose cross-border section sets the conditions on which personal data may leave, with the information commission as the body that supervises it. The window's movement is administrative rather than legislative. The commission's strategic plan for 2026 to 2028 takes the transfer regime toward operational regulation through guidance, compliance checks, audits and a data protection policy with guidelines. Until that guidance issues, the statute's conditions are the whole of the position.	NO CHANGE
Sierra Leone	Subscriber registration data may not leave the country without the regulator's prior approval, under regulations made in 2020. Regulation 22(3) of Statutory Instrument No. 35 of 2020 provides that subscribers registration information shall not be transferred outside Sierra Leone without prior approval by the Commission, and regulation 22(4) requires any such request to justify its purpose; regulation 19 requires the Commission to keep a central subscriber information database (regulations). That is the whole of the localisation rule in the repository: it reaches one data class held by one sector's licensees. No general rule on where government or personal data may be stored is on record, and the data protection Bill that would set one is not enacted.	NO CHANGE
Somalia	There is no domestic storage mandate. The Data Protection Act instead prohibits transfer outside Somalia absent adequacy or an approved safeguard. Articles 30 and 31 of the 2023 Act establish a conditional cross-border regime: transfer outside the country is prohibited unless an adequacy finding or an approved safeguard applies (Act). That is a transfer condition, not a localisation requirement. The implementing regulations published in April 2026 carry the same regime at Article 24 (regulations). No instrument requires that any category of data be held on infrastructure inside the country, and none of the government hosting documents states where public data sits.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
South Africa	The gazetted data and cloud policy stands; in February 2026 the department proposed a national government data centre to keep all government data in the country. The National Policy on Data and Cloud was gazetted as final in May 2024, before this window opened. As the communications department summarised it to Parliament, it requires government data bearing on national security and sovereignty to be stored only in infrastructure inside the country, and names the state IT agency as the authority that sources data and cloud services for government. 2026-02-24 — the department proposed a national integrated government data centre, run by a repurposed state IT agency, as a medium- to long-term measure, with government using industry capacity in the meantime. No budget, site or date is attached. What is in force for everyone else is an adequacy model: the data protection Act permits cross-border transfers where equivalent protection, consent or contractual necessity applies. The repository holds no instrument reconciling that with the policy's localisation rule for government data.	NO CHANGE the gazetted policy stands and a data centre to hold government data onshore is only proposed
South Sudan	*Not held*, searched 2026-09-06 - the regulator's own position is that data may be held abroad without loss of sovereignty. Speaking on a data sovereignty panel in November 2025, the authority's Assistant Director for Cybersecurity said countries including South Sudan can store data abroad without compromising sovereignty, through mechanisms such as data embassies (position). That is a searched absence rather than an unexamined one: no localisation mandate exists and none is being pursued. The only instrument in prospect is a data protection framework still in drafting.	NO CHANGE
Sudan	There is no economy-wide localisation law. Licensing requires disclosure of hosting location, and the digital identity's terms commit to primary storage in Sudan. Applicants for an internet-applications licence must state whether their hosting server sits inside or outside Sudan and name the hosting company, and data-centre licence categories separate operators owning facilities inside Sudan from cloud resellers (licensing). The national digital identity's terms commit to data minimisation and primary storage inside Sudan (terms), and the cybersecurity authority asserted full sovereignty over the platform and its encryption keys (statement). What the repository does not hold is any general requirement covering data outside the telecommunications licence and the identity platform.	MOVEMENT
Tanzania	Public institutions may host only in government-approved environments, and mission-critical financial data may not leave the country. Part V of the 2022 data protection statute sets the transborder data-flow regime, requiring an adequacy assessment and commission-authorised safeguards for transfers to states without adequate protection. The government data-centre standard requires public institutions to host only in government-approved environments and bars the use of cloud platforms not owned by government. Central bank guidelines bar mission-critical financial-sector data from being hosted outside the country. The minister gave a final three-month registration ultimatum in January 2026 and directed the commission to prepare nationwide compliance audits. No adequacy determination for any destination country has been published.	MOVEMENT
Togo	A continental profile records no localisation requirement; the data-protection authority states an objective rather than an obligation. The profile states that Togo imposes no restrictions on data localisation, no requirement for local storage or processing, and that articles 28 to 31 of the 2019 data-protection statute frame transfers rather than restricting them — the framework does not address the place of storage at all. The authority's president said in January 2026 that the final objective is to require personal data of Togolese to be stored in Togo, and that authorisation requests for international transfers are already being handled. The intention has an infrastructure counterpart in the May 2026 private-cloud protocol, and no obligation on anyone to use it.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Tunisia	A 2022 decree-law bars credit-information companies from hosting or transferring their data abroad — the only express localisation rule held. The sectoral decree-law on credit-information companies bars them from transferring their databases or hosting their data-protection sites outside Tunisia, and separately bars cloud hosting of credit information. That is the whole of express localisation on the record. The public-sector cloud labelling regime created by the 2023 cybersecurity decree-law is a hosting-label scheme rather than a localisation statute, and the general rule on data leaving the country is the 2004 data-protection law's authorisation regime, not a residency requirement.	NO CHANGE
Uganda	Cross-border transfer runs on the 2019 statute; the regulator applied it extraterritorially to a foreign platform and a satellite licence carries localisation conditions. The operative provision is section 19 of the Data Protection and Privacy Act 2019, which governs transfer of personal data outside the country; no separate localisation policy or regulation exists. 2026-02 - the data protection office ordered two foreign platform companies to comply with the Act's cross-border transfer rules, and by July all five orders had been complied with inside their 90-day timelines, with no appeal and no fine. 2026-05 - the communications regulator set out the data-sovereignty terms attached to a satellite operator's licence, and the licence as commercially launched requires a national gateway and physical point of presence, an operational office and registration of every device activated in the country. What the repository does not hold is any licence or decision text, so the localisation obligations reach this report through the regulator's and the office's own accounts.	MOVEMENT
Zambia	Localisation is being procured rather than legislated: ministry workloads hosted locally under a kwacha agreement and domestic storage tendered. The data protection statute carries a cross-border transfer regime at sections 70 and 71 rather than a localisation mandate, and no instrument requires data to be held in Zambia. 2025-10 — a partnership between the state technology institute and two operators put a platform in place for ministries to design, scale and host digital solutions locally under a kwacha-denominated service agreement. 2026-06 — the state operator tendered for 150TB of storage and GPU-accelerated capacity in country. What is emerging is de facto localisation through procurement and pricing, which is a weaker and more reversible thing than a rule — and no policy statement connects the two.	MOVEMENT
Zimbabwe	Guideline CDPG 4 bars hosting core banking and critical financial systems outside Zimbabwe without written approval, and enforcement becomes mandatory inspection in September 2026. The data protection authority's implementation guidelines state that it will not permit the migration or hosting of highly sensitive information, such as core banking platforms and critical financial systems, outside Zimbabwe, and that any exception needs prior written approval on a risk assessment and justification (guidelines). Regulatory Notice 2 of 2026 moves compliance from licensing to mandatory risk-based inspections of data controllers from 1 September 2026, beginning with nine priority sectors (inspections). A notice dated 8 March 2026 told organisations processing personal data without a data controller licence to regularise immediately, almost a year after the 12 March 2025 deadline had passed (warning). The guidelines are held as an excerpt truncated at the sixth of seven guidelines, so the full localisation regime is not on file.	MOVEMENT

Data governance policy

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	A national public-data governance framework was gazetted on 30 December 2025 in twenty articles. The framework did not exist at the window's opening. Presidential Decree 25-320 was gazetted in twenty articles, its article 15 giving the data-protection authority a supervisory hook and article 18 excluding defence, security and judicial data, and was reported as a launch in February 2026. Its article 19 classification and cataloguing duties are not shown to have commenced. A framework in force whose classification work has not started, and whose interoperability obligations wait on two reference documents that cannot be traced, is a legal position rather than an operating one. 2026-09-07 - a second joint session of the digitalisation high commission and the domestic trade ministry took the data sources themselves as its subject - how they are produced, updated and kept consistent - towards a unified digital mechanism for regulating the national market. It is the first account the repository holds of provenance being treated as the problem rather than the platform.	MOVEMENT
Angola	Regulators worked national data holdings against the continental data policy framework in Maputo, while the 2011 data-protection law awaits its revision. Data governance here is a law plus a regulator plus, since December, a method. The 2011 personal data protection law remains the governing statute and a replacement is announced for the next legislative year. The agency created to enforce it issued substantial fines in June 2026. The method arrived in December 2025, when more than 40 regulators from four Lusophone states met in Maputo to map national data holdings and governance gaps against the continental data policy framework and the Smart Africa blueprint, and launched the Portuguese edition of a data-governance toolkit. No national data governance policy document has been adopted.	MOVEMENT
Benin	A national digital public infrastructure roadmap was drafted in July 2026 on a once-only principle. No data governance policy instrument is adopted. 2026-07-31 — a national roadmap was drafted to link fragmented government systems around a once-only principle, its authors naming governance and coherence as the hard part. 2025-11-18 — the Cotonou declaration was adopted, a regional instrument rather than a national policy. Governance is being addressed through a roadmap and a declaration; no data governance policy has been adopted.	MOVEMENT
Botswana	No standalone data-governance policy is held; the Digital Services Act carries the enterprise data inventory and information-resource duties instead. 2025-10-17 — the Act establishes the Digital Services Authority and requires enterprise data inventories, information resource management and information-security provision. 2026-02-02 — the public service began harmonising employee privacy notices and issued a standard data-subject-rights form. The repository holds no data-governance policy document, and no statement of who owns government data across ministries.	MOVEMENT statute and practice moving with no policy between them
Burkina Faso	The council of ministers sent a constitutional revision merging the two regulators, an amendment of the 2021 data law and an organic law on 20 November 2025; all three were voted in August 2026. 2025-11-20 - the council of ministers agreed to transmit to the legislature a constitutional revision merging the broadcasting regulator and the data-protection commission, a bill amending the 2021 personal-data protection law, and an organic law for the resulting regulator. It is the step that turned a stated policy intent into the legislative process. 2026-08 - the new data-protection law was voted, prohibiting and sanctioning processing without consent, indexing administrative fines to turnover, and prohibiting transfer of sensitive data abroad, and the organic law creating the single merged authority was voted alongside it. Neither is promulgated, so the 2021 law remains the operative text — a law whose enforcement decrees were never issued in the five years it ran.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burundi	A National Data Governance Strategy was validated in November 2025 on seven pillars, treating data as a public good. 2025-11-14 — a National Data Governance Strategy was validated on seven pillars, supported by the United Nations regional commission and aligned to the African Union data policy framework, treating data as a public good. None existed before it. Validation is not adoption: no decree, gazettal or implementing instrument appears on the ledger in the nine months since, and no institution is named as owning the strategy. The data protection law reported under legislation arrived two months later and is the only binding instrument on this ground.	MOVEMENT
Cameroon	The 2026 internet governance forum put data at the foundation of interoperable infrastructure with no national framework on record for it to build on. 2026-08-18 to 20 - the forum was held at Yaounde on the theme of moving from fragmentation to interoperability, positioning data as the foundation for interoperable digital public infrastructure, trailed the week before. No national data-governance framework exists on the record for the theme to rest on, and no programme document, participant list or outcome text is held, so what was resolved is unrecorded. The interoperability the theme names has no instrument behind it beyond a mandate given to the state operator at the same event.	NO CHANGE
Cape Verde	A data strategy was kicked off by May 2026, while the diploma announced as a 2024 deliverable is unadopted. 2026-05-04 - a development process was reported launched with senior officials, the Secretary of State for the Digital Economy, external consultants and European Union representatives, its stated goal to move government from siloed systems to integrated collection and use of data across departments. No draft, adoption date or lead institution is published. The binding instrument has not moved: a diploma regulating data governance in the public administration was announced for drafting in 2024 and is unadopted at 2026-08-06, as is a companion diploma on documentary classification announced in the same statement. It is a distinct instrument from the data-protection law the commission enforces, and its absence is what leaves the strategy without a rule to write into.	MIXED a data strategy for the public administration was kicked off while the data-governance diploma announced for 2024 is still unadopted
Central African Republic	The public finances digitalisation plan names a data governance policy among six systems and a data centre; no text, date or status for it is held. The 2025-2027 plan was presented naming an electronic tax platform, a treasury system, procurement and payroll systems, a Tier IV data centre and a data governance policy, none of them priced. The costed operational plan is still unpublished and the named data governance policy is the only such instrument on file, with no text, date or status. 2026-07-02 — a public finance review estimates that digitising the tax administration could raise up to two points of national output in additional revenue in the short term, and recommends electronic public procurement and a digital cadastre over the longer term, against domestic revenue of about FCFA 187bn or 10.1% of output in a 2025 budget of about FCFA 385bn. It is the first independent assessment of the plan's subject matter the repository holds. So the fiscal case for digitisation is now made by an outside institution, and the policy the state named to govern the data it would collect does not exist as a document.	NO CHANGE
Chad	The national data governance strategy was validated at a national workshop on 7 October 2026; no adopting act or published text is on record. What is held is the mission page and the ministry's terms of reference (mission). No draft strategy, timetable or adoption date exists on the record. It would sit above a country with no data-protection law, no supervisory authority and a biometric register already interconnected with the finance ministry and a mobile operator. 2026-10-07 - the ministry and the United Nations regional commission validated the national data governance strategy at a workshop in N'Djamena, on seven pillars.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	A national data governance strategy for 2027 to 2031 was validated at a Moroni workshop on 24 and 25 August 2026; it is not published or adopted. 2026-03 - the telecommunications minister put a note to the Council of Ministers on creating a working group to draft a national data governance strategy; the Council took note, its only comment being to watch the duration of the work and the allowances attached to it. That is the first record of government sponsorship. 2026-08 - the strategy was reviewed and validated over two days in Moroni with government, private sector and civil society, examining its vision, five pillars and implementation plan. The research institute that ran the process describes it as delivered through the DataCipation project with the African Union, the European Union and the German development agency. Five months from working group to validated text. No adoption instrument, budget or responsible body is on record, and the text itself is not published.	MOVEMENT
Congo	A landscape assessment and national reform priorities are under way after consultations at Brazzaville in June 2026. 2026-06-02 to 09 - consultations and capacity-building were held at Brazzaville under a continental data-governance initiative, with a landscape assessment and national reform priorities under way across government, regulators, academia, civil society and the private sector, and no draft, timetable or adoption route published. The only account held is wire copy reading as the sponsoring body's communications, and its own release is not on file. Nothing on this ledger states what data the state holds, who may access it or on what basis, so an assessment is the first step rather than a policy.	MOVEMENT
Cote d'Ivoire	The national data governance strategy is named as one of two the ministry's new senior posts exist to implement; a migration equivalent is cited but unproduced. The strategy was handed to the Prime Minister on 13 March 2025 alongside the artificial-intelligence strategy and presented to the private sector in May 2025, and is now named as one of the two strategies the ministry's six new senior posts exist to implement. The document itself is not held. Against that, a migration data governance strategy was named by the diaspora directorate on 30 July 2026 as the framework for a fourteen-body profiling instrument and referred to again at an ECOWAS regional meeting hosted at Abidjan in August 2026, on neither occasion produced. A reference number or adoption decree would settle whether it exists.	MIXED the national strategy gained implementation posts while a migration data governance strategy was named twice without being produced
Djibouti	The first book of the Digital Code is the nearest thing to a national data-governance instrument; no separate policy document is held. At the period's opening no data-governance instrument was in force. the Digital Code's first book, published on 18 September 2025, carries the personal-data regime and is the closest instrument on file; no standalone policy document accompanies it. 2025-10-07 - the digital economy ministry names putting data-management and cybersecurity policies in place among the tasks still outstanding. Classification, retention and stewardship rules for state-held data are not held, and neither is any record of the regime operating.	MOVEMENT
DR Congo	A national data governance strategy was validated and handed to government on 13 November 2025. The Strategie Nationale de Gouvernance des Donnees was nationally validated and formally handed to the government on 13 November 2025 after a three-day ECA-led process, on six pillars: institutional leadership, the legal, regulatory and ethical framework, interoperability and data infrastructure, security and integrity of critical data systems, data skills and literacy, and evidence-based use of data; the digital economy ministry named a national implementation committee as the next step. No decree adopting the strategy is held, so it is validated rather than in force, and no implementation committee is reported constituted.	MOVEMENT
Equatorial Guinea	Data governance rests on the 2015-2017 electronic laws; no policy instrument sits above them. The law package is the whole of the framework: protection, retention, signature, access and communications, enacted between 2015 and 2017 and unamended. What would sit above it has not been adopted. The national digital economy strategy was still being finalised in September 2026, and the ratification of the regional data protection convention was approved by the Chamber of Deputies in March — an external commitment rather than a domestic policy.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	The only planning record touching data governance is a geospatial framework action plan filed in April 2026 (action plan). An action plan to domesticate the geospatial information framework was filed in April 2026; its content is not held (action plan). Against it, a 2022 structured assessment records no data quality framework and no system exchanging data across financial management, human resources, customs, tax or social insurance (dataset), and there is no data-protection law or authority (redetermination). A sectoral plan is not a national data-governance policy, and nothing on the repository claims one exists.	MOVEMENT
Eswatini	A National Data Governance Policy is targeted for completion before end-2026, with government undecided between a standalone law and amendments to existing legislation. A first national workshop ran in April 2026 and the policy was validated in July, on a procurement issued through a continental alliance in 2025 (validation, workshop, procurement). The minister told the Senate the completion target and stated that government has not decided between a standalone data-governance law and amendments to what exists; the target was put as aspirational in debate rather than as a statutory deadline (senate). That undecided question matters more than the date: the country already has a data protection Act, so whether data governance sits inside it or beside it decides which authority enforces what.	MOVEMENT
Ethiopia	A national data governance strategy is being drafted around named use cases in health, agriculture and public financial management. The strategy is being anchored in concrete use cases rather than written first and applied afterwards, with agriculture and public financial management the test domains alongside health (use-case approach). No draft text, adopting instrument or timetable is published, so the approach is on the record and the policy itself is not.	MOVEMENT
Gabon	Two council sittings a fortnight apart reorganise who governs state data — the ministries' information systems directorates and a new infrastructure and cybersecurity directorate general — both at draft decree. 2025-12-04 - the council took a draft decree on the attributions and reorganisation of the central information systems directorates in the ministries, expressly under the digitalisation ordinance, redefining their missions in light of emerging technologies and accelerating digitalisation. That is the chain of command for ministerial systems, exchanges and data. 2025-12-18 - a fortnight later it took a draft decree creating a directorate general for the development of digital infrastructure and cybersecurity, competent notably for national and international spectrum and radiocommunications monitoring, with directorates for strategy and planning, digital infrastructure, and cybersecurity and standardisation. 2026-09-18 - the council named the directorate general's first director general, whose missions overlap those of the national digital infrastructure and frequencies agency; no text dividing the two is published. No data governance policy document exists, and what the repository holds instead is a set of institutions being drawn and redrawn around the question.	MOVEMENT
Gambia	The national data policy has been a published draft since 2025 with no adoption, gazetting or implementing instrument. It was published by the communications ministry as a draft and has not moved (draft policy). It sits beside an enacted data-protection statute and a validated interoperability architecture, so the policy layer is the one part of the data stack that has stalled rather than the whole of it. 2025-07-03 - the data policy's validation is now dated: stakeholders endorsed the draft on 2 and 3 July 2025, aligned to the continental data policy framework. Two years on, no adoption, gazetting or implementation instrument has followed it.	NO CHANGE
Ghana	The National Data Strategy was validated in July 2024 and nothing has followed in the two years since. European partners enabled the strategy and a national validation workshop was held on 2 July 2024, since when no adoption, publication or implementation step is on file (validation workshop). The silence is the finding: a strategy validated with donor support and then left is a different thing from one still being written, and the repository cannot distinguish abandonment from delay.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	A national data governance strategy went into drafting on 19 June 2026, with no adoption date stated. The minister opened a stakeholder-engagement workshop on 19 June 2026 to draft a Strategie Nationale de Gouvernance des Donnees, led by the DNTIEN and covering data quality, security, interoperability and responsible use, framed within Vision Simandou 2040. This is the opening of a drafting process rather than an adopted framework, and the ministry states no adoption date.	MOVEMENT
Guinea-Bissau	A National Data Governance and Protection Policy decree was approved in draft by the Council of Ministers in July 2025 and has not moved since. 2025-07-10 — the Council of Ministers approved the draft decree on a national data governance and protection policy, alongside decrees on interoperability and a national cybersecurity strategy. Nothing on the repository confirms gazettal or entry into force, and nothing in the twelve months to 2026-08-26 touches it. Of the three decrees approved that day, only the interoperability instrument has moved since, and it moved through a programme announcement rather than a gazette. No data classification standard, no public-sector data catalogue and no data-sharing agreement appears anywhere on this ledger.	NO CHANGE
Kenya	A draft national data governance policy of May 2026 schedules implementation from July, with the personal and non-personal boundary undefined. The pricing method is deferred, and the draft text is not held (draft policy, monetisation question). It was workshopped with the United States State Department on 10 July 2026 (workshop). It remains on the information technology principal secretary's forward list as still to be completed, which is a different position from the implementation start the draft itself schedules.	MOVEMENT
Lesotho	A Data Management Policy was signed in June 2026 as a privacy, security and ethical-use framework, and a data value blueprint is in drafting. The minister signed the Data Management Policy on 12 June 2026 (signing), and its text is not held. Drafting of a National Data Value Creation Blueprint opened at a first national consultative workshop on 14 and 15 July 2026, with no text yet in existence (workshop). The country's membership of the Smart Africa programme behind it rests on a spokesperson's remarks carried by the government news agency. 2026-09 — the draft Data Value Creation Blueprint was validated at a national workshop in Maseru with Smart Africa and GIZ, the first country to validate one; its diagnostic calls the data landscape emerging but fragmented. It is not yet adopted and its text is not published.	MOVEMENT
Liberia	A national data governance policy issued in March 2026 designates the information commission as data regulator and sets an adequacy-or-consent rule for transfers. It prescribes signature and ratification of the continental cyber and data convention, and was developed under ministry leadership with a regional civil-society body and aligned to the continental data policy framework (policy). It designates a regulator under a statute that was unenacted when the policy issued, so the policy named an authority for a law that did not yet exist; the law has since been signed and the authority still has not been constituted.	MOVEMENT
Libya	The identity authority's Government Data Governance Policies moved from presentation in February 2026 to first application in April, with no adoption instrument stated. The policies were presented at a Tripoli cloud-computing workshop in February 2026 as a national vision for data ownership, integration and cybersecurity-by-design (presentation). They were applied in April 2026 as the reference framework for the Libyan Zakat Fund's digital platforms, the only application on file (application). The authority's own account is the sole source, and no adoption instrument or gazette date is stated, so the standing of the policies cannot be established from this repository.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Madagascar	No national data policy is adopted; drafting was commissioned in August 2025 through a continental agency. A procurement notice of August 2025 sought consultants to draft a national data policy domesticating the African Union data policy framework, confirming that no such policy had been adopted (notice). The statistics office launched a microdata sharing platform for census and major survey data in August 2025 (platform). The sequence is a data-sharing facility in service before the policy that would govern it. No adopted policy, no draft text and no consultation record is held.	MOVEMENT
Malawi	The digitalisation policy and the 2024 Act are the standing instruments; a sectoral agriculture strategy was commissioned. The government's own action plan names the Digitalisation Policy 2023-2028 and the Data Protection Act 2024 as the current data-governance instruments, which is the clearest statement in the repository of what the framework is taken to be. 2025-10 - regulations on the engagement of data processors were published, the first controller-to-processor rule with a text behind it. 2026-01 - the agriculture ministry commissioned consulting services for a national digital agriculture strategy, its terms of reference initiating a sectoral data-governance and technology-requirements assessment. It is the first extension of data governance into a line ministry the repository holds, and it is a terms of reference rather than a strategy.	MOVEMENT
Mali	A data-management law was recommended at the national digital week in August 2026, and nothing has been tabled. The recommendation came out of the same sovereignty-framed set of proposals as the digital council and the startups law (recommendation). No draft, sponsoring ministry or parliamentary stage is on record. Data governance in the country currently rests on the 2013 personal-data statute and the authority administering it, and not on any instrument covering government data as an asset.	MOVEMENT
Mauritania	Governance runs through the regulator's deliberations rather than a policy: transfers abroad and foreign cloud in 2025, hosting and certification in 2026. There is no single national data governance policy. What performs the function is a sequence of deliberations by the data-protection authority under the 2017 personal data protection law: a 2025 deliberation on transfers abroad with a list of adequate countries, another on foreign cloud services as later amended, and monthly meetings taking up data hosting and data-centre certification and interconnection between the population register and other registers. The authority works to its own strategic plan for 2023 to 2026. Alongside it sits a 2023 national strategy for open and interoperable data.	MOVEMENT
Mauritius	A National Data Strategy 2025-2029 was launched in January 2026 and a separate data governance strategy was committed to in July, with no text published. The data strategy was launched on data protection day around responsible data governance, cybercrime prevention and online protection of minors, with a memorandum signed between the police, the data-protection office and the national computer emergency team (strategy, preparation). A national data governance strategy was separately committed to at an operator summit in July 2026, alongside forthcoming amendments to the data protection statute aimed at cybersecurity, privacy and online safety for children; no text, timetable or introduction date is published (commitment).	MOVEMENT
Morocco	Data governance rests on the 2009 protection law and the regulator's deliberations, not on a policy instrument. The 2009 law creates the protection commission and remains the founding statute. The commission governs by deliberation rather than by published policy: it issued five deliberations in November 2025 on cookies, newsletters, patient tracking and access-control data. The governance layer that would sit above them is not published. The interoperability platform is live and its binding legal framework is still pending.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Mozambique	A National Data Governance Policy, Strategy and Action Plan was validated in December 2025 as a draft resolution and had not been adopted by July 2026. Zero Draft 2 is written as a Council of Ministers resolution with its number and approval date left blank (draft). It proposes an independent National Data Governance Council of eleven to seventeen members with expert seats appointed by presidential decree subject to a two-thirds confirmation vote of the assembly, sitting alongside a data protection authority the law has not yet created, with four data classification tiers and a jurisdiction claim over data affecting Mozambican citizens and entities wherever located (workshop, diagnostic). Before it, government entities followed their own data policies with oversight implied across four institutions and coordination gaps between them (inception).	MOVEMENT not adopted
Namibia	The Data Protection Bill was promised for tabling in September 2025 and was still in final polishing in January 2026; the statistics agency's 2014 policy is the operative instrument. The ministry said in August 2025 it would table the Bill that September (tabling); in January 2026 the minister described the data protection and cybercrime bills as under final polishing (polishing). It is not tabled and no data-protection statute is in force. What is operative is narrower: the statistics agency's own policy of February 2014 on how it collects, processes and disseminates data (policy), and five national statistics system standards issued in September 2025 covering quality, metadata, inclusion, presentation and dissemination (standards). The cost of the gap is on the record: after a breach at the students' financial assistance fund in October 2025 the incident response team's head called for urgent finalisation of the law (breach). Data governance here is a statistics-agency practice, not a national policy.	STALLED
Niger	An ordinance on the civil-status regime and decrees creating a registration agency were adopted in April 2026 to remedy register dispersion. The Council of Ministers of 22 April 2026 adopted the ordinance on the civil-status regime, amending the 2019 law to clarify the constitution and use of the national civil and population registers, add biometric parameters and a unique identifier, and enable electronic issuance and signature of civil-status acts — together with the decrees creating the national registration and identification agency to remedy the registers' dispersion and lack of interoperability. The reforms were taken on a national awareness tour whose fourth stage opened at Agadez on 29 August 2026. No general data-governance policy covering government data beyond identity is on file.	MOVEMENT
Nigeria	A memorandum with the Governors' Forum extends federal data-protection governance to state level, against a cloud policy still in draft. The data protection commission and the Governors' Forum signed a memorandum on 7 May 2026 creating an implementation partnership and working group to deepen data protection and privacy governance at state level — the first instrument the repository holds reaching below the federal tier. The federal instruments it would extend are the Data Protection Act 2023 and its enforcement regime. The policy that would govern government data more broadly is not made: the national policy on data and cloud remains in draft. No state has been reported adopting anything under the memorandum.	MOVEMENT
Rwanda	A national data-sharing policy approved in 2025 positions government data as open by default, and implementation began after cabinet approval in May 2025. The policy adopts a safe-access framework, governance sitting with the statistics office and the platform with the information society authority, and it positions government data as open by default, with institutions as stewards rather than owners. Implementation is under way and the policy text and its seven annexes are not held, so what the safe-access framework actually requires of a controller cannot be stated here (implementation, governance). It is the clearest instance in this unit of a pattern that recurs: the instrument is announced and summarised, and the text that would let anyone check the summary is not published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sao Tome and Principe	The identity institute published version 1 of a national data strategy and roadmap in July 2025, and a capacity building workshop on adopting the continental framework followed in July 2026. The strategy sets objectives for responsible and ethical data use, data-based decision-making and an innovation-oriented culture, and treats artificial intelligence as an opportunity to be explored using public data rather than as anything in operation (strategy). The workshop ran over two days with a European development hub, a continental development agency and a regional civil-society network (workshop). Version 1 is published, and no adoption instrument, budget or implementation report follows either document.	MOVEMENT
Senegal	A national data strategy is cited as adopted and as the frame for the data-protection bill, and a blueprint for value creation through data was validated in draft in September 2026. The strategy is cited as adopted, with its adoption date unestablished, and it is the frame against which the personal-data bill is being re-levelled. Its first appearance in the repository is a coverage gain rather than a policy move (strategy). A ministry and partner workshop over two days in July 2026 identified priority sectors for a data and artificial-intelligence governance blueprint, and no published blueprint, date or budget is on file (blueprint, governance). 2026-09-22 - the ministry validated the draft blueprint at a two-day workshop with Smart Africa's data-governance programme and GIZ, refining its implementation framework and monitoring mechanism. Senegal is a pilot with Kenya and Lesotho; no finalisation date is set.	MOVEMENT
Seychelles	No standalone national data-governance policy exists; the National Bureau of Statistics Act 2010 is the closest institutional instrument. The Act, assented on 9 July 2010, founds the Bureau and the national statistical system and repeals the 2005 statute (Act). The African Union's peer review of May 2025 records the Bureau's professional independence and recommends a new Statistics Bill (review), which is the nearest thing on record to a legislative data-governance reform. Data governance is otherwise distributed across the Data Protection Act, the statistics statute and a sectoral spatial policy, with no instrument tying them together.	NO CHANGE
Sierra Leone	Cabinet approved a National Data Protection Policy in April 2026, above a National Data Strategy issued in 2023 and updated with donor support. The policy was approved by Cabinet on 21 April 2026, and the same decision authorised the Bill that would give it force (policy). The data strategy carries January 2023 as the date on the document; the ministry's own index files it as February 2023 and the formal launch was later again, so three dates exist for one instrument. It was updated over five months with donor support and aligned to the continental data policy framework (strategy, update). 2026-09-05 - a framework was named as in development for the first time: the communications minister named a data governance framework at a meeting with United Nations agencies, alongside the government data centre at the telecommunications authority tower and a redundancy site at State House. No draft, scope, adoption route or timetable is published, and the redundancy site appears here with no capacity or commissioning date.	MOVEMENT
Somalia	The implementing regulations for the 2023 Act were gazetted in April 2026, and the authority opened registration and licensing in June. The full regulatory text was published in the Official Bulletin on 5 April 2026, setting registration and licensing, data-protection-officer duties, consent, breach notification, compliance audit, complaints and the cross-border transfer regime (regulations). The authority then published its operational registration and licensing regime for controllers and processors under Articles 10 and 14, with forms, guidelines, a compliance checklist and renewal templates (regime, guidelines). That is a governance regime for personal data. No policy governs public-sector data as an asset.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
South Africa	The National Policy on Data and Cloud was gazetted in May 2024, and a policy direction of December 2025 pushes data sovereignty into sector ownership regulation. The policy was gazetted as final in May 2024, which settles a question this report had carried open: the instrument is made, not still in draft. 2025-12-11 — a formal policy direction requires the communications regulator to weigh data sovereignty, data protection and data security in sector ownership regulation. That is the policy reaching into licensing, and it is the first instrument on this ledger to do so. What is still missing is implementation: no data classification standard, no public-sector data catalogue and no reporting against the policy appears, and the localisation duty it contemplates is reported separately under data localisation.	MOVEMENT
South Sudan	A data governance strategy went to procurement in June 2026, the enabling step behind a future exchange layer. The ICT ministry launched a consultancy tender under the regional digital integration project to design and develop the strategy, with bids closing on 30 June 2026 (tender). No award, draft or adoption date follows it. Two of the three instruments a data-governance regime needs - the strategy and the enterprise architecture - are at tender stage at once, and the third, a data protection statute, is recorded separately as not held.	MOVEMENT
Sudan	A data and artificial intelligence authority now carries the mandate to regulate national data management; no policy document sits behind it. The prime minister's decree of 5 November 2025 established three authorities under the communications ministry, among them a data and artificial intelligence authority evolved from the National Information Center and mandated to regulate national data management (decree). A draft data and artificial intelligence law was reported in redrafting in August 2026 and is not in force. The mandate exists; the policy does not. Nothing the repository holds states what the authority's rules over public-sector data actually are.	MOVEMENT
Tanzania	A National Data Management Framework was reported at stakeholder stage with completion targeted for January 2026, and eleven months have passed with nothing later on file. It is positioned within a continental data policy framework (framework). Nothing has entered the repository since August 2025. The country has a data protection Act in force and an active commission, so what is missing is the management layer above them rather than the protection layer itself.	NO CHANGE
Togo	No standalone data-governance policy is held; the 2021 digital strategy is the only national instrument treating data as a cross-cutting programme. The ministry's own detailed presentation of the Strategie Togo Digital 2025, dated April 2021 and adopted publicly by the President on 27 April 2022, carries data governance, data valorisation, state reference registries and a national interoperability platform as programmes. Its period has expired and it is still cited as the operating framework — 181 classrooms connected under it in 2026. The institutional side moved: the Council of Ministers adopted a decree on 19 February 2026 converting the geographic information directorate into an autonomous institute, on the ground that the existing arrangement held back production of reliable geographic data.	NO CHANGE
Tunisia	A 2021 decree is the operative data-governance instrument, and a first national strategy reached final draft in March 2026. Decree 2021-3 establishes opening by default, the national open-data portal, the e-government unit's governance duties, a joint consultative committee, an open-data officer in every public body, and metadata, quality, licensing and dataset-inventory rules; no later standalone instrument supersedes it. The final draft of a first dedicated national strategy for the governance, opening and valorisation of public data was presented at a workshop in March 2026, implementing that decree, and remains a draft under consultation rather than an adopted instrument. The decree's own required outputs — a dataset inventory, per-body open-data officers, licensing decisions — are not held for any body.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Uganda	A National Data Strategy is being drafted and the information security framework was updated in July 2026; no data governance policy is adopted. 2025-12 - the ICT ministry's permanent secretary confirmed a National Data Strategy under development with other agencies, civil society and the private sector, framed round data as a national asset, legal standards for collection, protection, sharing and use, and priority use cases in public health, agriculture, financial inclusion and education. No draft text, adoption date or gazette record is held. 2026-06 - a readiness assessment for artificial intelligence was validated with UNESCO, naming stronger data-governance frameworks among what the country needs. 2026-07 - the updated National Information Security Framework was launched by the ICT minister, setting minimum controls for government institutions and critical-infrastructure protection; the framework document itself is not held. So the governance layer is a security framework in force and a data strategy that has been in draft for at least nine months.	MOVEMENT the data strategy still in draft
Zambia	A health-sector statutory instrument went to stakeholder review, and a spatial data policy adopted open by default for non-sensitive data. A data governance framework is a planned component of the national electronic government plan and has not been issued as an instrument of its own. 2025-09 — a two-day multi-stakeholder review examined a draft sector statutory instrument under the data protection statute, to give the 2024 health data governance framework legal enforceability. A sector instrument arriving before a national one is the pattern this row records. 2026-06 — the spatial data infrastructure policy was adopted with non-sensitive data open by default and the electronic government division as lead authority, which is a governance rule for one class of data rather than for data generally.	MOVEMENT
Zimbabwe	A National Data Agency and a national digital regulatory committee are both provided for in the artificial-intelligence strategy, and both remain planned. The data agency is provided for in the strategy approved by Cabinet in October 2025 (agency). The regulatory committee would report to the communications regulator, which is also the designated data protection authority (committee). Creating a data agency and a regulatory committee under a body that already holds both the telecommunications and data-protection mandates is a concentration the strategy proposes and does not address.	MOVEMENT

Open data policy

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The data-governance decree sets no open-data or reuse policy and keeps data flows inside public institutions. The position is unchanged at both ends of the window: the data-governance decree sets no open-data or reuse policy and keeps data flows inside public institutions, and a named expert criticises it for closing data to private and academic users. It is a cited absence rather than an unexamined one, and it is a design choice rather than an oversight: the decree that governs public data was gazetted inside the window and is built around exchange between administrations on a network kept physically separate from the internet, not around publication.	NO CHANGE
Angola	The statistics institute undertook to publish 10 per cent of census microdata six months after the definitive results. The open-data portal remains a project commitment. The most concrete open-data undertaking on this repository came with the census. Publishing the definitive results in November 2025, the statistics institute invoked the accessibility principle of the national statistical system law and stated that the results and 10 per cent of the microdata would be on its own site six months later. That date fell in May 2026, and nothing on the repository records the microdata appearing. A census portal and mobile application did launch in July 2026. The framework above it is still a plan. An open-data portal and shared data-governance framework are commitments of the digital acceleration project, with nothing published as operating. The 2002 access to administrative documents law is not an open-data instrument.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	Budget transparency scores 77 out of 100 and the first open-government action plan reached its co-creation roadmap. No open data policy is adopted. 2026-06-18 — the government presents Open Budget Survey 2025 results of 77 out of 100 on transparency, against 1 out of 100 in 2012. 2026-08-14 — the budget directorate published the co-creation roadmap for the first national action plan. 2022-12-23 — an open data readiness assessment was published and no open data policy has followed it. What exists is budget transparency and an open-government commitment; the open data instrument itself is still absent.	MOVEMENT
Botswana	Part V of the Digital Services Act mandates a national open data policy; the policy itself is not published. 2025-10-17 — section 24 requires a national open data policy and machine-readable publication. 2026-03-14 — terms of reference were issued for a second phase of open data hackathons and a forum, tied to the policy's anticipated adoption by Parliament. The statutory duty was made in October 2025 and no draft policy, adoption date or national portal has followed.	MOVEMENT mandated by statute and still unadopted
Burkina Faso	There is no open-data policy; the nearest is the statistics council's diffusion mandate, set by decree of 26 August 2025, over a portal whose hostname no longer serves a public catalogue. 2025-08-26 - the statistics council was reorganised by decree and tasked with proposing national statistical policy and diffusion priorities and coordinating the national statistical system. The diffusion mandate names publication as a duty without setting a licence, a format or a release calendar. The open-data programme that did exist has decayed. The joint ministerial order founding the open data initiative names the technology agency as executing body and sets the objective of releasing non-sensitive public data for re-use; the instrument is held and the portal hostname no longer serves a public catalogue. The access statute is worse placed still: its number, date and text are not held, so a right of access exists in report and not on the repository.	MOVEMENT
Burundi	A draft access-to-information law was adopted in Council of Ministers on 10 June 2026; no open-data policy instrument is held. 2026-06-10 — the Council of Ministers adopted the draft law on access to public information, presented by the communication and media minister. It is a draft adopted in Council rather than a law in force: no text is published and no parliamentary date is set. Against it the repository holds no national open-data policy or strategy. What exists is an operative licence rather than a policy: the statistics institute publishes an open licence governing reuse of the data on its own platform, which is an instrument of one institution and not a whole-of-government mandate.	MOVEMENT
Cameroon	A national open-data policy is provided for in the artificial-intelligence roadmap and nothing has been published. The policy was provided for in the 2040 roadmap presented in July 2025, with nothing published, and the position is the same at both ends of the window. It is not among the ten priority areas tabled to cabinet on 30 July 2026, which is the nearest thing to a status update the repository holds: the instrument that would carry it has been reordered around other things. No draft, consultation or publication schedule exists on record.	NO CHANGE
Cape Verde	An open-data portal named as a 2024 deliverable has not been delivered two years past its stated year. The portal was named as a 2024 deliverable to the National Assembly's First Committee, alongside a database of public bodies, an integrated public-services portal and a human-resources database. No open-data portal is held two years past that year. Of the deliverables named together, the integrated services portal did arrive in February 2026, so the failure is specific to open data rather than to the programme as a whole. No policy, licence, catalogue or publication obligation exists in its place.	STALLED

COUNTRY	DEVELOPMENTS	PROGRESS
Central African Republic	The statistics institute modernised its open data portal against the international readiness index in June 2026. No open data policy sits above it. Publication is happening without a policy. The statistics institute modernised its open government data portal, working to the international open data readiness index, in June 2026, which is the repository's only operating release channel. It rests on statistical rather than open-government authority: the statistics law and its replacement went to a validation workshop in April 2026, and the institute works to international statistical standards under a quality framework diagnostic. No open data policy, licence or release duty for other ministries is held.	MOVEMENT
Chad	No open-data policy is adopted; the statistics institute runs five data portals whose microdata terms are not open. The institute lists an Open Data Portal, a national data summary page, a national statistical data archive, a goal tracker and a development-plan indicator tracker (portals). The terms behind them are restrictive: microdata users must not copy or transmit the data to anyone without prior written agreement, must cite a prescribed source line and must supply two copies of any report produced (policy). Two openings sit at validation stage: a national agricultural data collection and dissemination strategy proposing a statistics web portal, drafted with donor support in November 2025 (strategy), and the Journal Officiel platform launched in May 2026, which is public-information access rather than reusable data (platform).	MOVEMENT
Comoros	No open-data policy or licence is on file; the statistics act's transparency duty is the nearest instrument. Article 5 of the 2011 statistics act binds the components of the national statistical system to transparency rules giving all users access to processed information, free or paid, as soon as the data is available. That is a publication duty on one system, not a government-wide open-data policy, and no licence, default or release calendar is set anywhere on file. What operates in its place is the statistics institute's national microdata archive, holding fifteen datasets at 23 August 2026, with access to individual files conditioned on registration rather than granted outright. Nothing in the repository sets a policy over the rest of government: no ministry publishes a dataset inventory, and no instrument says what is to be opened or when.	NO CHANGE a dissemination archive operating with no open-data policy behind it
Congo	The statistics institute's open data portal gained a partnership to capitalise statistical data, and an assessment set out what trustworthy national data handling would require. 2026-06-05 — a partnership agreement was signed to capitalise statistical data through the open data portal. 2026-06-09 — an assessment set out what trustworthy national data handling would require. A portal exists and is being fed. No open data policy, licence or dataset inventory is adopted behind it.	MOVEMENT
Cote d'Ivoire	The 2024-2026 open-government action plan commits to promoting open data locally through hackathons; no open-data policy or licence is held. The fifth open-government action plan commits to promoting open data locally through hackathons and to publishing laws and decrees through the information-access authority. That is a promotion commitment, not a policy: no open-data policy, licence or portal mandate is held.	NO CHANGE a plan commitment with no open-data policy behind it
Djibouti	The Digital Code was published in September 2025; its articles on access to documents and open data are not held, so no open-data duty can be stated. No statutory basis for open data was in force at the period's opening. The Digital Code was published in September 2025, but its articles on access to administrative documents and the reuse of public data are not held, so their content is not established. The national summary data page under the monetary fund's data standard was already in service at both ends of the period. No open-data catalogue has been published on any date on file, and no dataset inventory or update policy for the existing platform is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
DR Congo	No open-data policy instrument exists; a national open-data platform was launched on 23 February 2026 and an access-to-information bill is in commission. 2026-02-23 - the statistics institute launched a national open-data platform publishing datasets across demography, economy, health, education, public finance, agriculture and infrastructure. A platform is not a policy: no licence, release calendar or publication duty sits behind it. 2026-03-28 - a bill on access to information and transparency in public life was ruled admissible and sent to commission; it sets access as the norm and limitation the exception, applies to public services and some private actors, and requires a simple, fast and free request procedure alongside proactive publication. It is not enacted. 2026-08-17 - the central bank relaunched its website as a public economic-data portal carrying exchange rates, inflation, interest rates, statistics and indicators. Publication is proceeding institution by institution, with no rule requiring any of it and none of the reciprocal work — a state moving the other way on geological data, vesting it in itself and charging for access.	MOVEMENT
Egypt	The open data policy entered into force in August 2025 as a transitional framework pending a data governance law. At the window's opening the repository held a single passing ministerial reference to the policy, with no date of adoption, text, issuing instrument, dataset inventory or portal established. The artificial-intelligence council, chaired by the communications minister, adopted the policy drafted by the communications ministry, and it entered into force in August 2025 as a transitional framework pending a data governance law and its executive regulations. It requires an open data officer in every government body and a joint data access committee under the council to approve datasets for publication, with those duties passing to an Egyptian Data Governance Authority on its establishment under the coming law. The principles are open-by-default treatment with timeliness, accessibility, free-of-charge and non-discrimination, and the ministry has begun building institutional capacity and a unified national portal. The instrument text is still not held, the portal does not yet exist, and the authority that is to run the regime awaits a law that has not been passed.	MOVEMENT
Equatorial Guinea	The first transparency and access-to-information law passed the Senate unanimously in May 2026; no portal follows from it. The Prime Minister opened the parliamentary debate on transparency, access-to-information and public finance bills in February 2026, and the Senate passed the transparency bill unanimously in May. An access right is not an open data policy. Nothing in the repository records a publication scheme, a dataset inventory or a portal following from the law, and the statistics strategy that might have carried one is a production plan rather than a release policy.	MOVEMENT
Eritrea	No open data policy or licence is held. Government data reaches the public as survey reports, not as datasets. Nothing on the repository names an open data policy or a licence under which government data is released; a 2022 dataset records only a basic open data portal. The national population and health survey of 2025 is the largest data-collection exercise in fifteen years, and its output was a report scheduled for the following year rather than a published dataset. The pattern holds across the repository: the geospatial capacity programme produces trained analysts and classified imagery for ministry use, and nothing produced under it is published. Data here is produced for the state's own use, and the question of releasing it has not been put.	NO CHANGE
Eswatini	No open data policy or portal is held. The draft data governance policy is about sharing between institutions rather than publication to the public. The draft policy for 2027 to 2031 was validated in July 2026 and turns on institutions reaching each other's records, not on publishing them (validation). The drafting process opened in April 2026 with European Union, member state and GIZ support under a data governance initiative (workshop). The data-mapping directive creates the inventories a publication regime would need, distinguishing what is held from what is protected (directive). What the repository does not hold: a national open-data portal, a publication licence, a list of datasets any public body is obliged to release, or a date by which any of that is due.	NO CHANGE a data governance policy in draft and no open-data instrument

COUNTRY	DEVELOPMENTS	PROGRESS
Ethiopia	A government-commissioned assessment recommended reviving the failed common open-data portal (assessment). The 2023 e-government assessment found no open-data sharing between institutions and recommended reviving the common open-data portal (assessment). Digital Ethiopia 2030, approved by the Council of Ministers in November 2025, commits to a national data authority and structured government data (approval). Ethiopia OpenAgriNet launched in February 2026 on open standards with consent-based data governance, the clearest sectoral operationalisation of open-data principles in the window (launch). The open-data policy guideline was recorded as still in draft in 2018 (supervision report) and the repository holds no later statement that it was adopted, so the policy instrument itself has not moved in eight years.	NO CHANGE the open-data policy guideline recorded as draft in 2018 is still not held as adopted
Gabon	The digitalisation ordinance defines open government as making public data and applications available and accessible to citizens. No portal or policy has issued under it. The ordinance's own definitions carry the commitment: open government is defined as making public data and applications available and accessible to citizens, alongside electronic, mobile, digital and smart government. A definition in a framework instrument is what the repository holds. No open government data portal or policy is held at any date, and no dataset, licence or release calendar sits under the definition. Against that, the external assessment of fiscal transparency found again in its 2026 report that the country does not meet the minimum requirements, which is the nearest published measure of whether public information reaches the public.	NO CHANGE a standing position the repository holds for the first time
Gambia	The 2024-2027 open data strategy records no registry, no legal framework and no portal, with targets set for 2026. The strategy is unusually plain about its own starting point: The Gambia has no data registry, no open-data legal framework and no portal. Its targets fall in 2026. Nothing in the repository records any of the three arriving. The strategy is the instrument this indicator asks for; the portal it provides for is a separate question the ledger carries as its own row.	NO CHANGE
Ghana	The open data initiative dates to 2012 and its national data sharing policy, drafted under a 2018-2019 revamp, is still described as being finalised. The initiative dates to 2012 and is led by the technology agency; a draft national data sharing policy incorporating open data was produced under a 2018-2019 revamp and is still described as being finalised. The draft policy itself failed to fetch twice and is not held, so the agency's own description is what stands. 2026-03 - the statistical service announced an upgraded public statistics catalogue for release that month, with improved discovery, navigation and exploration tools. A catalogue upgrade is not a policy. No dataset count, licence, publication schedule or reuse figure for the initiative appears on this ledger.	NO CHANGE a fourteen-year-old initiative whose policy is still described as being finalised
Guinea	No open-data policy is adopted; the strategy's own initiative to formulate one has produced no instrument, while extractives disclosure scored 90 out of 100 on data accessibility. The right of access exists in statute: article 10 imposes proactive publication, refreshed at least quarterly, of sixteen categories including statistical, economic and social information and budget and public-finance data at central, regional and local level. No policy instrument sits under it. 2026-05-12 - the extractives transparency board scored the country 73.5 out of 100 overall, with data accessibility and open data at 90, the highest band reached on any transparency-facing requirement, against 50 for civil society engagement, 50 for beneficial ownership and 50 for licence allocations, and recorded that administrative rules on civil society organisations produced tangible restrictions on those engaged in implementation. The score covers extractives disclosure only. 2026-07 - the statistics institute ran a national workshop on statistical data exchange modelling and migration to the second version of its open data platform, covering eleven statistical domains, with 22 institute staff and two from the space agency. Capacity building toward a platform, not a policy.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea-Bissau	No open data policy exists; the access to information bill remains in development and no portal is on the record. The repository holds no Guinean open data policy, licence or portal. The adjacent instrument is the access to information bill the ledger carries as in development. Publication that does happen is done by institutions for their own purposes: the state budget volume and the fund's national summary data page are the repository's only routine releases.	NO CHANGE
Kenya	A state-run data marketplace is proposed at KSh 396m to build and operate, offering more than 1,000 datasets over five years. It would be overseen by a proposed national council, with pricing deferred to a later phase and no valuation method stated (marketplace, draft policy). The proposal is to sell state data rather than to open it, and it sits inside the same draft policy that leaves the personal and non-personal boundary undefined, which is the question a marketplace would have to answer first.	MOVEMENT
Lesotho	The government's own digital policy records that open government data legislation has yet to be promulgated. 2024-12-30 — the National Digital Policy states Lesotho has yet to promulgate legislation on open government data, the most current statement the repository holds. 2025-09-24 — the Prime Minister told a leaders' symposium that Lesotho had adopted a national digital framework and was piloting digital public infrastructure, working with regional and European partners to validate a data governance policy. The absence was searched on 31 August 2026: no portal, no policy, no dataset inventory. A data management policy was signed in June 2026 and is not an open-data instrument.	NO CHANGE
Liberia	No adopted open-data policy; the statistics office publishes public-use microdata under access conditions instead. The anonymised public-use dataset for the 2024 women's empowerment and nutrition survey was released on the statistics office's own microdata portal under stated access conditions, with the confidentiality basis cited as the 2004 statistics Act rather than an open-data instrument. That is open-data practice in the absence of a policy. The repository holds no adopted national open data policy and no government open-data licence.	NO CHANGE
Libya	A draft national open-data policy was issued in November 2025 alongside the open government data platform; no adopted text has followed. The identity authority launched the platform on 27 November 2025 with a draft national open-data policy and a National Technical Guide covering standards and metadata for adoption by government entities (launch). Nine months on, the repository holds no adopted policy, no adopting decision and no list of the entities that have taken the guide up (workshop account).	MOVEMENT
Madagascar	Three of four known open-data platforms were reachable in August 2026 and no whole-of-government open-data policy or mandate is held. A capture of August 2026 confirms institution-specific resources rather than a national programme: a licensed parliamentary open-data interface, a gated national-statistics microdata platform and an unconfirmed general portal (capture, microdata, portal). The finance ministry's own portal does not resolve. No open-data policy, public-sector information reuse instrument or publication mandate is held for the country.	NO CHANGE
Malawi	A national open data portal launched in September 2025; the only open data policy covers extractives. The country's sole document titled an open data policy is scoped to extractive-industry data and runs to 2027. Nothing on file sets a default, a licence or a release calendar over government-held data generally. 2025-09 - the open government secretariat announced a new public-facing open data portal for budget, project and service-delivery data. The announcement does not link to the live portal, and no dataset count is stated. 2026-03 - a government circular mandated use of the national electronic procurement system across all ministries and agencies from 1 April 2026, which standardises how procurement data is captured before it is published.	MOVEMENT a portal launched while the only policy instrument stays scoped to one sector

COUNTRY	DEVELOPMENTS	PROGRESS
Mali	The statistics institute publishes an open data licence agreement and worked through migration to a second-generation portal platform in June 2026. Both are the institute's own, covering its data rather than government data generally (licence, migration). No dataset count, portal address or open-data policy instrument is held, so what has moved is one institution's terms of use and not a government position. The institute also publishes a microdata catalogue (catalogue).	MOVEMENT
Mauritania	A 2023 open and interoperable data strategy with a thin portal, an electronic gazette portal since November 2025, and systematic extractives disclosure. The policy exists and the publishing behind it is thin. A national strategy for open and interoperable data was adopted in 2023, and the portal it provides for carries little. Two narrower channels do publish. The electronic gazette portal launched in November 2025 puts the official journal online. And extractive-industry data is released under a 2019 decree requiring systematic disclosure, which the transparency initiative's board scored as moderate against its standard in 2024. A national data portal is among the procurement commitments of the digital programme.	MOVEMENT
Mauritius	The national open data policy of May 2017 stands unamended; a statistics platform launched in 2025 is the practical movement. The policy was published in May 2017 and is still the governing instrument (policy). The statistics office launched a data platform with United Nations development agency support on World Statistics Day 2025 (launch). The 2026 national data strategy is the first instrument to revisit the policy's ground (strategy). No dataset count, licence statement or publication mandate under the 2017 policy is held.	NO CHANGE
Morocco	The open-data programme has four published procedure volumes and a four-strand action plan, with a steering committee of ten bodies established in December 2019. The published procedure set runs to manuals for open-data officers and data managers from April 2021, a data-inventory methodology from February 2023 and a standards and formats manual from December 2024 (inventory methodology, standards manual). A steering committee of ten bodies was established in December 2019 and a readiness assessment carried out in 2020, after which a four-strand action plan covering legal, technical, organisational and usage work was adopted (governance). The assessment report itself is not held.	MOVEMENT
Mozambique	No open data portal. A national data governance policy, strategy and action plan were validated in December 2025 and are not yet adopted. The repository carries an explicit finding that no national open data portal exists, and nothing in the window supplies one. What moved is the policy above it: a validation workshop on 5 December 2025 settled the draft national data governance policy and strategy with its action plan, work a financier also recorded as prioritising data governance and digital sovereignty. Publication happens where a sector decides to publish. The public infrastructure data portal launched in August 2026 is the one working instance, and the right of access rests on the 2014 right to information law rather than on any release duty.	MOVEMENT
Namibia	No open data policy exists. The Access to Information Act is gazetted and uncommenced, and applications for the Information Commissioner opened in February 2026. The Act is gazetted and not commenced — section 86 leaves commencement to the Minister and no commencement notice is held — but the National Assembly invited applications in February 2026 for the Information Commissioner and Deputy under the appointment regulations (invitation). The closest thing to a publication regime is spatial: the 2015 policy provides for public access and a metadata catalogue (policy), and the statistics agency tendered in October 2025 to redesign the public geoportal that serves it (tender). The agency also runs a microdata catalogue and data portals page. An open data policy would say what every public body must publish. Nothing on this repository does, and the statute that would compel disclosure has waited four years for a commencement notice.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Niger	A renovated nutrition information portal launched in September 2025, on an access-to-information charter whose implementing decree was never made. The statistics institute's director launched the renovated nutrition information portal on 18 September 2025, described as an interactive digital library giving access to nutrition reports, studies and surveys. The ministry also recorded the handover of the household survey on access to information technology on 13 May 2026 and its distribution to the regulator and the state broadcaster. The nearest thing to an open-data instrument is the 2011 charter of access to public information, which establishes a general right of access and free electronic delivery where available; article 35 leaves its implementing decree to a later act that has not been made. No open-data licence, catalogue or machine-readable release policy is on file.	MOVEMENT
Nigeria	A national data action plan for 2025 to 2028 was launched in December 2025 above the 2018 open data policy. The action plan launched on 15 December 2025 is a coordinated national data roadmap, the first national data instrument since 2018; the repository holds the statistics bureau's catalogue record because the published document carries no extractable text. The 2018 open data policy remains the only national instrument expressly titled one and still governs the national portal and agency publication obligations. Neither has a compliance report, review or dataset inventory behind it, so whether agencies meet their publication obligations is still unestablished.	MOVEMENT
Rwanda	The 2017 data revolution policy expired in 2022 with no replacement, and the 2025 data-sharing policy puts open data outside its own scope. Cabinet approved the National Data Revolution Policy on 26 April 2017 for the period to 2022 (communiqué). It has expired. The data governance framework published in November 2025 carries a public access classification within a wider package of classification, metadata, quality and incident-management guidance (framework) — a classification, not a publication duty. The data-sharing policy that sits beside it states open data falls outside its scope, so nothing on the repository obliges any body to publish.	NO CHANGE
Sao Tome and Principe	There is no open-data law, regulation or policy, against personal-data provisions that do exist, and no open government data portal. The readiness assessment states plainly that no specific law or regulation on open data exists, while personal data — which it calls fundamental to developing artificial intelligence — is covered by the 2016 protection law (assessment). Nothing else in the repository names an open-data instrument, portal or dataset catalogue. The nearest published artefact is the citizen's budget, which is a document rather than a portal. The absence is dated and searched rather than merely unexamined.	NO CHANGE
Senegal	A national geospatial portal launched in November 2025 and the statistics agency extended its open-data platform to the regions. The geospatial portal publishes official base and thematic data to the public, with a standards-conforming metadata and cataloguing editor, a map library offering consultation, download and print-order services, and thematic data organised in five poles covering agriculture, the blue economy, social services, environment and infrastructure — the clearest open-data portal launch in the window, against a dormant government data portal. The statistics agency's own route reached the regions: a four-day workshop closed at Louga on 24 June 2026 training about thirty participants from the region's data-contributing services in the exchange standard, multidimensional modelling and use of the platform. The commitment behind them is a strategy measure rather than a charter: the 2023-2028 data strategy commits to a legal framework adapted to data opening and to a national publication platform; no standalone open-data law or decree was found.	MOVEMENT
Seychelles	There is no open government data policy; a 2020 corrective action to publish one is not shown closed. The extractives transparency board found in September 2020 that revenue data was published in open format but that the multi-stakeholder group did not appear to have an open data policy, and set a corrective-action deadline to publish one (decision). Nothing held records that policy being made. In December 2025 the statistics bureau opened two externally financed expressions of interest to modernise its website and improve public access to national data (procurement) — a procurement step, not a portal and not a policy.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Sierra Leone	Two sectoral instruments and no national one: a SLEITI Open Data Policy from 2016 and an open data programme at the information commission. The extractive industries transparency initiative adopted its own open data policy in 2016, covering the data it holds (policy). The Right to Access Information Commission runs open data as one of its programmes (programme). What the repository does not hold is a national open data policy, a licensing regime, or any instrument binding ministries generally. The two on record bind one sector and one commission.	NO CHANGE
Somalia	No open-data policy is held. The operative statement is the statistics bureau's portal terms of use, which set licensing and format rather than obligation. The terms published in July 2024 govern the statistics platform: a CC-BY 4.0 licence, machine-readable formats and a stated update cadence (terms). That is a licence, not a policy: nothing obliges any public body to publish, sets a default of openness, or names datasets that must be released. The government's own open-data portal was carrying eight datasets across ten ministries at the time of the probe, against a vision statement targeting 2020.	NO CHANGE
South Africa	A National Open Science Policy is on the books with no commencement date stated; no open data policy of general application is held. The repository holds one instrument in this space, a National Open Science Policy, and records that no commencement date is stated for it. Nothing in the twelve months to 2026-08-26 commences, amends or reports against it. It is also narrower than the indicator: an open science policy governs publicly funded research output, not government administrative data. No open data policy of general application, no national portal and no publication duty on departments appears anywhere on this ledger.	NO CHANGE
South Sudan	An open data portal runs at the statistics bureau on public, registered and restricted tiers; no whole-of-government policy exists. The bureau's resources page describes an operational portal with publicly accessible datasets, visualisation, multi-format download and interface access, on three data-access tiers (portal). It is scoped to statistical data. No open data policy binding ministries generally, no licence statement and no dataset inventory outside the bureau's own catalogue appears in the repository.	MOVEMENT
Sudan	No open-data policy is held. The access-to-information law of 2015 is the closest instrument, and its commission was never made operational. The law ratified on 27 January 2015 establishes a citizen right to obtain information from public institutions and a commission with powers to compel publication (law). Available reporting indicates that commission was never effectively established. A land-sector assessment found no open data available online since the 2023 escalation and recorded Sudan's last Open Data Inventory score as 24, ranking 159th worldwide (assessment). No open-data policy, portal or publication schedule was located.	NO CHANGE
Tanzania	Release runs on the statistics bureau's 2024 dissemination policy rather than a general open data policy, so what governs it is sectoral, and a statistical portal is in service. The operative instrument governing the release of official statistics is the statistics bureau's 2024 dissemination policy, which sets an open-access tier and principles of transparency, accessibility, timeliness and confidentiality. The procurement authority's 2025 policy mandates publication of procurement data in open contracting format through its portal. The two statistics offices run an integrated portal bringing administrative, demographic and survey data together. Three sectoral instruments in place of one policy is the position, and no dataset count or reuse measure is published for any of them.	NO CHANGE no general policy has ever been adopted

COUNTRY	DEVELOPMENTS	PROGRESS
Togo	The portals exist and are being rebuilt; no open-data policy, charter or licence has been adopted behind them. The national open data portal and a geoportal were launched on 19 December 2024, which establishes the infrastructure and dates it. A national workshop of 7 to 11 April 2026 trained focal points on statistical data and metadata exchange modelling and began standing up a second-generation portal for the statistics institute and the sector ministries, financed by the World Bank. No adopted policy, charter or national licence was located; the geoportal's own terms invoke a presidential decree without giving its number or date, and Togo is not a member of the Open Government Partnership.	MOVEMENT
Tunisia	Opening by default has been the rule since 2021, and a public data registry is live, against an unadopted strategy. The 2021 decree establishes opening by default, the national open-data portal, an open-data officer in every public body and rules on metadata, quality, licensing and dataset inventories. A national public data registry launched by the e-government unit lets citizens view and request inventoried government data, and an evaluation names it among the few commitments of the 2023-2025 open-government action plan to produce results citizens can see, against a national open data strategy still awaiting formal endorsement. The strategy's final draft was workshopped in March 2026 and is not adopted.	MOVEMENT
Uganda	No open data policy has been adopted: the last record is a draft disseminated to ministry staff in 2021/22. Open data reaches the public through sector portals instead. The ministry's own quarterly report records a draft Open Data Policy disseminated to staff in the 2021/22 financial year. Nothing in the repository records an adoption, a gazette entry or a successor draft in the four years since, which is now a dated and cited absence rather than an unexamined one. 2025-12 - the procurement portal's open-contracting upgrade selected and validated 36 of 78 candidate data points with the procuring entities, across social, institutional, environmental, economic and climate-finance dimensions, with three ministries' inputs still outstanding and no go-live recorded. 2026-07 - the statistics side went furthest: all 155 of the 201 sustainable development goal indicators the country reports, with their metadata, are on the National SDG Open Data Portal, up from 41 indicators in 2015, with 46 goal indicators still lacking data. Publication is therefore running ahead of policy, sector by sector, with no instrument stating what government must publish or on what licence.	NO CHANGE a draft from 2022 with nothing adopted since
Zambia	The access-to-information proactive-disclosure framework is stated to be in final operationalisation, and spatial data is open by default. An open government data framework is a planned component of the national electronic government plan, not an adopted policy. 2026-06 — the national spatial data infrastructure policy was launched with non-sensitive data open by default, the first open-by-default rule the repository holds for Zambia and confined to geospatial data. 2026-07 — the information ministry stated that the access-to-information Act's proactive-disclosure framework, covering contracts, budgets, expenditure and development projects, is in its final operationalisation stage, following the 2025 regulations and the December guidelines. Proactive disclosure under an access statute is the nearest thing to an open data mandate here, and it is not yet operative.	MOVEMENT
Zimbabwe	No national open data policy is held. The statistics agency runs an open data portal, and an open government data initiative is announced but not made. The statistics agency's open data portal is in its second version, with an access and tutorial guide published for users and an SDMX rollout behind it (portal). An open government data initiative is announced under the artificial-intelligence strategy as a commons for public institutions, industry and researchers, and remains a plan (initiative). What the repository does not hold is a policy: no instrument setting what public bodies must publish, on what licence, or to what timetable. The portal is an operating system without a published rule behind it.	NO CHANGE a portal in operation with no policy behind it
