PROGRESS REPORT

Standards: progress report, October 2025 – October 2026

Edition of 2026-10-12 · compiled by Claude Opus from the documents in the Corpus repository

> *54 countries. Each row below is carried verbatim from that country's own progress report, which answers a fixed frame of indicators over the period; nothing is written here. A country not listed under an indicator has* **No evidence** *on it in its own report.*

NATIONAL INTEROPERABILITY STANDARDS · NATIONAL QUALITY STANDARDS · ADOPTION OF INTERNATIONAL STANDARDS

Progress values. *Movement* — some form of progress, however minor, has been recorded. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the repository holds a standing position and nothing in the period touched it. *No evidence* — the repository holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Movement, regulations still pending*.

The place reports do not share one window; the period above is the range they span.

National interoperability standards

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	A national information-security referential covers 14 domains; no interoperability standard is held. The clearest national technical standard the repository holds is an information-security referential covering 14 domains including asset management, access control, cloud-services security and incident handling. It is security, not interoperability. The addressing side does have one: the national addressing procedures guide sets a data model and procedural standard. No whole-of-government interoperability framework, message standard or conformity test appears anywhere, and the national interoperability system this ledger holds separately is a system rather than a standard.	NO CHANGE a first stated position with no earlier account behind it
Angola	Interoperability is governed by the 2018 decree and built by contract; the territorial unit codification law of September 2025 supplies the one common key. No published interoperability standard, data dictionary or schema catalogue exists. What exists is an instrument and a platform: the 2018 decree on interoperability of the state administration, and a platform whose contract is reported at US$13 million with training terms of reference issued in February 2026. The window's real standards movement is a shared key rather than a shared format: the law codifying territorial units, of September 2025, which gives every register the same geographic identifiers. Sector-specific delivery standards exist in one industry, through the hydrocarbon data delivery regulation.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	The interoperability framework binds public and private bodies providing a public service, on named standards, with its coordinating structure reporting to the President. The framework has been in force since March 2020, binding public and private bodies that provide a public service, with four levels of challenge, five common infrastructure components and named standards. Its governance clause states that the coordinating structure should report directly to the President — an explicit answer to the question of who outranks a ministry that declines to connect. Nothing amended it in the window. The referentials consulted on in July 2026, reported under the interoperability roadmap, are the first attempt to add architecture standards on top of it, and no conformance regime, certification scheme or published register of compliant systems exists.	NO CHANGE
Botswana	The national interoperability framework is being aligned under an externally funded programme; the framework itself is not published. 2025-10-17 — the Digital Services Act requires a standardised framework for secure exchange of information, an information gateway and an interoperability standard. 2026-02-17 — a programme running since August 2024 through Expertise France, ESTDEV and HAUS is improving and aligning the framework, its standards, guidelines and tools. No standard, framework document or conformance regime is published, and no list of the systems the framework covers.	MOVEMENT under external assistance
Burkina Faso	A procedures manual for ministerial information-systems directorates was validated in September 2025, under a decree requiring three sequential consents before a public platform goes live. 2025-09-23 — a harmonised reference framework for ministerial information-systems directorates was validated at a workshop, against a regulatory duty that had stood on every public service for more than twenty years with no manual in existence. Formal approval by joint ministerial order is not recorded as signed, and signature would settle it. The governing instrument is unchanged: the platforms decree requires a prior favourable technical opinion before development or acquisition, a security non-objection before go-live, and assignment of the full source code and current documentation by the supplier or in-house team before a platform enters service, with the same regime restated in 2026. The source-code assignment is the unusual clause and it is what makes the in-house builds reported elsewhere durable rather than vendor-locked.	MOVEMENT
Burundi	Health standards were defined at a national workshop in April 2026 and the education system was assessed against continental norms in June; no cross-government standard is adopted. 2026-04-07 to 10 — a national health information workshop defined common technical standards, naming HL7 FHIR, with priority data-exchange flows and mediation for the country's fragmented health platforms. 2026-06 — Burundi self-assessed its education management information system against the continental EMIS norms and standards at a three-day technical workshop; no score or action plan is published. Both are sectoral. The cross-government instrument that would sit above them, the Concept type des systemes d'information des institutions publiques, was presented for validation in December 2024 and has not been adopted.	MOVEMENT
Cameroon	The interoperability layer is tasked to the state operator and the infrastructure beneath it is still a forum resolution; no standard is published. The posts and telecommunications ministry has tasked the state operator with carrying national data and infrastructure interoperability, with no design published (tasking, minister). The national interoperability infrastructure itself was agreed as a direction at the 2026 Internet Governance Forum rather than specified (forum). No technical standard, schema or profile is published, so a ministry system has nothing to build against.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Cape Verde	No technical interoperability standards document exists; Decreto-Lei 47/2022 stands in its place, requiring alignment with the State's transversal solutions and prior opinion for public ICT purchases. The decree regulates the duty to inform, makes prior opinion mandatory for acquisition of information and communications technology goods and services across the central public administration, and approves the coordination procedure for digital transformation initiatives, requiring alignment with the State's transversal solutions including the authentication platform and the data-exchange platform, with the state modernisation directorate reviewing significant investments in articulation with the state technology operator. That is a procurement and coordination duty, not a standards catalogue: it says systems must align, and does not say to what. The diploma that would set the standards is unadopted and the framework it would sit in is mandated and unpublished.	NO CHANGE a standing position the repository holds for the first time
Central African Republic	No published standard. A government platform is at pilot stage and customs transit interoperability is being built to a regional standard. Interoperability here is being built project by project rather than to a published national standard. The government interoperability and data platform launched in February 2026 is at pilot stage, inside a digital governance project at 78 per cent progress. The one exchange working to an external standard is customs: transit interoperability between the regional system and the customs platform. Statistics work to international standards under a quality diagnostic. No enterprise architecture, data dictionary or identifier convention is published.	MOVEMENT
Chad	No national interoperability standard is published; the agency states the mandate and the data-governance roadmap names it a priority. The national ICT agency states that it coordinates government information systems to ensure their interoperability, and publishes no standard, schema or exchange rule (mandate). The first phase of the national data governance strategy roadmap closed on 21 May 2026 with a workshop naming interoperability among the national priorities to be reinforced, after a mid-May assessment mission reviewed the existing legal, institutional and technical landscape; no standard was adopted (phase). The World Bank's diagnostic finds public platforms built in silos with no shared infrastructure, secure networks, common standards or interoperability across administrations (diagnostic).	NO CHANGE
Comoros	An interoperability framework and a government enterprise architecture are named as components of the national e-government plan; neither is published. The citizen portal's concept note is the only record in the repository that names either. It places the Cadre d'Interoperabilite and the Architecture d'Entreprise Gouvernementale inside the Plan National e-Gouv, alongside the emergent-Comoros plan and the 2028 digital strategy. No profile, schema, register of standards or conformance requirement is on file, and no ministry is named as owning one. The note's own request is a census: it asks government entities to report the e-government platforms they have built, so that a database of them can be assembled before the portal is deployed. A government that is still counting its own platforms has not yet begun to set standards between them. The page carries no date; it is dated here by the day it was retrieved.	NO CHANGE a framework named in the national e-government plan with no standard published
Congo	A general information-systems security reference was validated in April 2026 ahead of adoption, and public revenues were put on a single platform. 2026-05-16 — a restitution workshop validated the draft general reference for information systems security, subject to amendments, ahead of adoption by the agency. It is the nearest thing to a national technical standard the repository holds, and it is not yet adopted. 2026-06-11 — an order set public revenue payment onto one platform, a de facto standard for one function.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cote d'Ivoire	Five public administrations had joined the national interoperability platform by 22 July 2026, against a target of 100 interoperable services by the end of the year. 2026-07-22 - a workshop reported that five public administrations had joined the platform, twelve structures were named for phase one, and the aim was to make those five services operational before 31 July 2026 and to reach 100 interoperable services by the end of 2026 out of 31 administrations judged mature enough to connect. The platform's director general states it is already available; the minister named a governance project making information-system heads accountable for their own developments, and a commitment to interconnect at least 700 public services within three years. The standards those connections are to be made against are the general interoperability framework the 2017 ordinance requires. Five services against 700 is the distance, and nothing published gives a conformity test any of the five had to pass.	MOVEMENT
Djibouti	The national interoperability framework sets the standards layer; no technical specification or conformance register is held. The framework defines a technical interoperability layer and a semantic layer, and provides for governance-level standards and specifications. What is not on file is the layer below it: no published technical specification, data-exchange schema, application-programming interface catalogue or conformance register. The one system in the period described as exchanging data to a stated pattern is the national mobile identity service, where partner administrations reach only the authentication services, without direct access to the databases - an architecture stated by its owner rather than a published standard.	NO CHANGE
DR Congo	The only conformance duty is sectoral: hospital information systems must be homologated against named health data-exchange, imaging and interface standards. No national standard exists. 2026-06-16 - the health digital agency made homologation of hospital information systems mandatory under a ministerial order of 11 March 2025, requiring candidate systems to demonstrate conformity to named standards for health data exchange, medical imaging and application interfaces, and to the national health identifier and the digital health enterprise architecture. It is the only instrument in the repository naming a standard and requiring conformity to it. Nothing equivalent exists across sectors. The interoperability framework is a consultant deliverable inside a project whose consultant is not yet appointed, and the Digital Code carries interoperability as a definition rather than an obligation. The nearest thing to a cross-cutting standards act is classification rather than exchange: a national regime of four classification levels with access limited to cleared agents, traceability of transmissions, reinforced archiving and a ban on sending sensitive documents over private messaging.	MOVEMENT
Egypt	The one sectoral exchange standard held is the smart-metering adoption of 2025; no whole-of-government standard is on the repository. The repository holds one exchange standard and it is sectoral: a 2025 national standard adopting the international smart-metering data-exchange standard. Another is a specification rather than a standard: a national electronic receipt technical specification setting the document element, data structure and mandatory fields for education-service return receipts exchanged with the tax authority. No whole-of-government interoperability framework, message standard or conformity test appears anywhere, and the ministry's own programme page names linking government digital systems as the strategic objective without one.	NO CHANGE a first stated position with no earlier account behind it
Equatorial Guinea	No interoperability standard exists; the diagnostic found none and the standards agency is pre-launch. The World Bank diagnostic records no interoperability framework, and the body that would issue one set out a seven-stage plan in March 2025 and remains pre-launch. The commitment that exists is declaratory: the Malabo declaration of May 2026 commits to interoperable standards for green digital infrastructure, agreed at a symposium the country hosted.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	A standards institution since 1995 and a regulator charged with setting technical standards. Neither has published an interoperability standard. The institutional basis exists twice over. The standards institution was constituted in 1995, and the communications proclamation of 1998 makes the ministry's communications department sole sector regulator and sets the establishment of technical standards among its objectives. What neither has produced is a published standard for how government systems exchange data. Nothing on the repository names an interoperability framework, a data dictionary or a common identifier convention, and the systems that do exist run separately: customs on its own platform, tax on another, health on a third, with no exchange layer between them.	NO CHANGE
Eswatini	No national interoperability standard is published. The ICT ministry's own report records the e-government interoperability framework under review. The ministry's report to Parliament for 2024/25 records GovStack-model application development and a review of the electronic-government interoperability framework; the framework itself is not held (report). The draft data governance policy proposes Mchumanisi as the exchange platform, which is an architecture rather than a standard (proposal). Where standards have been adopted they are sectoral: the health information exchange runs a master patient index with deterministic and probabilistic matching. More than half of ministries lack meaningful system interoperability, which is the condition a standard would exist to change. Two of the three sources staged for this indicator did not reach the repository, so what is held here is thinner than the search behind it.	NO CHANGE a framework under review and none published
Ethiopia	The government interoperability framework remains the standing instrument, listed as approved and not superseded (repository entry). The interoperability framework of record is the Ethiopian Government Interoperability Framework, carried as approved in the innovation and technology ministry's own guidelines and standards repository (repository entry). Digital Ethiopia 2030, approved in November 2025, commits to interoperable digital systems (approval), but names no standard and supersedes no framework. The repository entry is a document-library listing rather than the framework text, so the repository holds that the framework exists and is current without holding what it requires.	NO CHANGE
Gabon	The digitalisation ordinance requires information systems to be interoperable. No technical standard, catalogue or conformance test sits under the requirement. The ordinance's principles include interoperability, and it states that information systems must be interoperable. That is a duty without a referent: no standards catalogue, technical specification or conformance test is published against it. The framework that would supply one is financed rather than adopted: a common interoperability framework and an interoperability platform for shared government services sit inside a project whose platform remains unnamed in the repository and among four projects set out at the sixth steering committee. Where interoperability has been achieved it is sectoral and unstandardised: the health information system project closed documenting interconnection of health facilities and a shared patient record.	NO CHANGE a standing position the repository holds for the first time
Gambia	A national enterprise architecture was validated in May 2026 as the interoperability blueprint, and is not adopted, funded or implemented. It was validated under an international open-standards initiative (validation). A blueprint validated and not adopted is the same position the data policy is in, and both sit behind an identity system and a data centre that are already running, so the standards layer is arriving after the systems it would govern.	MOVEMENT
Ghana	A national data exchange hub was named again in July 2026 for standardised sharing between institutions, with no design, cost or timetable. A hub was launched in 2009 and stalled on funding and unclear mandates (the 2009 system). The communications minister named a National Data Exchange Hub the government plans to establish, without saying whether it revives that system or replaces it (re-announcement). The interoperability legal base is being rebuilt through the harmonisation bill in parallel, so a standard, a platform and a statute are all announced and none is in force.	NO CHANGE an old system re-announced with nothing new behind it

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	The state digitalisation agency publishes four referentials for state information systems, of which one is an interoperability standard — a working technical document rather than a binding national standard. The register lists registration of government domains, data security, source code management, and rules of interoperability for information systems. The interoperability referential is the only national interoperability standard located. Its version number and the absence of any adopting decree, order or gazette reference indicate a working technical referential rather than a binding standard, and the page carries no publication date. Nothing states that any system has been tested against it. What is being adopted alongside is an external specification set: a technical standards adoption process is at workshop stage, and the interoperability platform it points at is described as in service without a published conformance statement.	NO CHANGE a standing position the repository holds for the first time
Guinea-Bissau	Decree 27/2025 sets national interoperability rules and the platform design was delivered in November 2025. The rule and the design arrived within a month of each other: the government approved the national interoperability regulation by decree in October 2025, and consultants delivered the interoperability structure, the platform and a digitisation action plan for the main public services in November. What is not yet on the record is any system exchanging data through it. The interoperability platform on the ledger remains in development.	MOVEMENT
Kenya	Two health interoperability implementation guides were published in August 2026, both served as continuous builds rather than authorised publications. A core guide stands at version 1.0.0 and a patient summary guide at 0.1.0, and both pages state they are not authorised publications; no gazettement, conformance requirement or implementer list is held (core guide, patient summary). Four foundational digital-health governance documents were launched at a health summit on 21 August 2026, together establishing the architecture for governing, connecting and using health data that three decades of collection had left without a shared framework; the documents are not individually named in the record and no commencement or compliance date is stated (foundational documents).	MOVEMENT
Lesotho	A Government Enterprise Architecture and Interoperability Framework has been under development since the 2025/26 budget, with no further detail published. The budget speech recorded the framework as under development, aimed at improving government efficiency and service delivery and at avoiding fragmented and costly infrastructure deployment across government (budget speech). No draft, adoption date, standards register or list of the systems bound by it has been published in the eighteen months since.	MOVEMENT
Liberia	Executive Order 163 creates a central standards authority and requires an interoperability framework within 180 days. Before April 2026 no body owned government-wide technical standards. Executive Order 163 creates the Office of Technology, Digitalization and Innovation as that authority and requires a first release of the Government Interoperability Framework within 180 days, with an enterprise architecture framework and a digital systems inventory alongside. The chief technology officer's terms of reference assign the drafting duty. Nothing has been published, so the standards themselves remain prospective.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Libya	No framework is adopted: a roadmap proposes one and the national data guide sets a method, not a standard. The national guide for government data of December 2022 sets a six-stage governance method and stops short of any interface specification or schema, which is what an interoperability standard would have to supply. The regional commission roadmap of December 2025 proposes a framework and records none as adopted. Meanwhile the exchange layer runs without one, through the authority's electronic linkage service and the national data exchange already on the ledger. 2026-09-06 - the committee behind the national information system fixed its own composition: at its sixth regular meeting in Tripoli on 1 September it reviewed financial indicators and tied permanent seats to the office of director of an information and documentation centre, with a written letter required for a proxy. Its mandate, published output and the indicators it reviewed are not held. Payments have a published specification the wider exchange lacks: the central bank's developer portal documents LYPay's participant APIs and NUMO, the national QR standard for customer- and merchant-presented payments, on a page last revised in 2025.	NO CHANGE
Madagascar	The national interoperability framework is the standing technical standard and gained an institutional basis in law in December 2025. The framework, at version 1.0.2, was reviewed for official publication in November 2022 and sets the general provisions, definitions, scope and foundational principles of state interoperability (framework). The platform implementing it launched its first stage in April 2026, with the first usage conventions signed by participating institutions (launch). The capture stops before the framework's own chapters on interoperability levels, governance model, architecture and operational directives, so the repository holds the standard's principles and not its technical content.	MOVEMENT
Malawi	The labour market system is being built around the international statistical data-exchange standard, the first such adoption on file. The government's own readiness assessment finds a government-wide interoperability platform and data-exchange standard absent, which is the position at the window's opening and is not formally superseded. 2026-02 - the enterprise service bus was named one of five core programme priorities, with 25 e-services at advanced-stage onboarding onto the national exchange platform. 2026-04 - the country's first integrated labour market information system was built around SDMX, the international statistical data-exchange standard, across six government and labour institutions. One sector adopting an international standard is not a national profile, and it is the only concrete standard the repository can name.	MOVEMENT
Mali	The standards body publishes no interoperability standard. The public key infrastructure that would underpin one remains planned. The institution exists: the national standardisation and quality agency, created by ordinance in 2012, an international standards body member which considered a draft 2026 budget in January. Nothing it publishes addresses how government systems exchange data. The technical precondition is also unmet. The public key infrastructure framework drawn up with the telecommunications union is still planned, and the national digital week carried it among its recommendations. The one live exchange is bilateral and sectoral: customs interconnection piloted with a neighbour.	NO CHANGE
Mauritania	A public digital service standards framework is under development with German support, and the 2023 data strategy proposes making the state digital agency the national interoperability operator. A three-day standards and interoperability workshop was run by the ministry in March 2026 with German support; no framework or standard has been published (workshop). The agency intended to operate national interoperability was proposed in July 2021 as a public establishment under the digital ministry with about fifty staff, EUR 220,000 to set up and EUR 1.4m a year to run, with a draft creation decree (proposal). A June 2023 open-data strategy proposed revising the decree that created the state digital agency so as to name it national interoperability operator (strategy), and the agency took part in the data protection authority's June 2026 coordination on hosting its data (hosting). 2026-09-28 - the digital ministry began training 120 new staff to apply unified state digital-infrastructure standards to every new service; the standards are not published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritius	The e-Government Interoperability Framework dates from 2002 and no successor is held, twenty-four years on. Cabinet noted a Digital Service Framework on 28 August 2026 setting mandatory principles and standards for every government digital service, from procurement through maintenance (framework). It is noted, not yet issued, and no compliance date is stated. Version 1.0 was published in November 2002 and remains the standing interoperability instrument (framework, case study). The interoperability commitments of the 2025-2029 blueprint have produced no published instrument. A country running a mobile identity wallet, an instant payment switch and a Tier IV sovereign facility is doing so on an interoperability framework older than any of them.	MOVEMENT
Morocco	The interoperability platform is live and its binding legal framework is still pending. The implementation report of August 2025 records the platform in service and the framework that would oblige systems to use it not yet in force — capability without compulsion. The standards beside it are being set: a national data classification guide on the ledger and the protection commission's deliberations on specific processing categories. The platform predates that report: the digital development agency launched it in September 2022, built by Minsait, with the unified social registry and MASSAR already connected, so the 2025 record shows a standing platform still without its binding framework rather than a new one.	NO CHANGE
Mozambique	An electronic government systems interoperability regulation was reviewed in December 2025, stated to set standards for integrating public information systems. The review rests on a single account of institute remarks and the regulation text is not held (review). No standards register, conformance requirement or list of systems bound by it is published, so the repository records that an interoperability rule exists and cannot say what it requires.	MOVEMENT
Namibia	An interoperability framework was drafted in 2016 on the Estonian model and never gazetted; the standards that exist are in signatures and payments. A government expression of interest carries the fullest dated official account: a framework drafted by the Office of the Prime Minister's public service information technology management department in 2016, modelled on Estonia's data-exchange layer, with no gazetted framework, adoption date or implementing platform since (timeline). Where technical standards have been gazetted they are sectoral. The electronic signature regulations of December 2025 set the rules for signature interoperability (signatures), and a determination of July 2026 sets operational and cybersecurity standards inside the national payment system (payments). A governmental interoperability solution is in service from the Office of the Prime Minister, and an inter-ministry data exchange platform has no record since September 2025. Ten years from a draft framework, the exchange runs and the standard for it is unpublished.	MOVEMENT
Niger	A decree defining interoperability mechanisms between the civil and population registers was adopted in May 2026, with a national unique identifier. The Council of Ministers of 18 May 2026 adopted the decree implementing the 2026 ordinance, defining management of the national civil register and expressly providing interoperability mechanisms between it, the national population register and other functional systems, together with a national unique identifier for every Nigerien and for long and short-term foreign residents. That sits on the 2019 electronic transactions law, under which no interoperability specification has been published. No technical standard, data dictionary or exchange specification supporting the decree is on file.	MOVEMENT
Nigeria	A government enterprise architecture was handed to the technology agency in April 2026 and piloted at four agencies, alongside a digital trustmark. The architecture was built over about two and a half years with a foreign development agency, is hosted by the government infrastructure company and was piloted at the identity commission, customs, immigration and the technology agency (handover, takeover). A digital trustmark has been in issue since October 2025 (trustmark). Neither carries a published conformance standard, adoption count or list of bound systems.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Rwanda	A government-wide enterprise architecture framework stands as the functional equivalent of an interoperability framework, and only an excerpt of version 2.1 is held. The framework document was acquired as an excerpt in August 2026, so it is present in the repository as an artefact rather than as a readable standard (framework). A reference study of interoperability challenges in the public sector is cited rather than absorbed (study). The gap the country's own analysts name most often is the data-sharing platform rather than the standard, which is recorded separately.	MOVEMENT
Sao Tome and Principe	The national interoperability framework sets mandatory and recommended technical standards across its component segments, and has stood at draft version 0.1 since 2021. The framework sets out definitions, purpose and scope, general and per-dimension policies, the compliance regime, governance and revision arrangements, and technical specifications for its components (framework). It is version 0.1 of November 2021 and no successor version, approval instrument or compliance report is held (framework). A compliance regime in a draft nobody has adopted binds nothing, and the systems built since have each set their own interfaces.	NO CHANGE
Senegal	An inventory of state information systems was launched at a July 2026 workshop alongside interim diagnostic results, and the inventory carries no scope, deadline or publication commitment. Interim diagnostic results were presented and the inventory launched at a workshop on 29 July 2026, implemented by the state digital agency with donor programme funding (architecture, projects, agenda). The inventory is the load-bearing commitment: without it there is no list of the systems any interoperability platform would have to reach. It is now under way and carries no scope, deadline or publication commitment.	MOVEMENT
Seychelles	The ICT department claims the mandate for government-wide interoperability standards; the standards themselves are not published. The department states that adopted technical standards intended to support the seamless interoperability of e-government services, and the integration of all e-government applications and databases through established software and database standards, fall within its Policy, Standards and Research Section (mandate). Nothing held names a standard, a version or a conformance route. The nearest published interoperability requirement is sectoral: the December 2025 payment regulations obliging straight-through processing (regulations).	NO CHANGE
Sierra Leone	The ministry names an enterprise architecture and six other frameworks and publishes none of them; the exchange layer itself is in development. The standards exist as a list. The communications ministry's own page states that the national digital transformation programme seeks comprehensive digital standards for a consistent user experience and public trust, and names a national enterprise architecture, a data protection framework, a cybersecurity framework, an information security management framework, web content and accessibility guidelines, a deployment checklist and general information-technology controls, alongside a compliance and audit function. It publishes none of the documents and dates none of them. What would carry them is being built: a government service bus and exchange layer, with the registration authority urging an identity-first approach in August 2026. One standard is adopted and public, the open-source software policy. A government-wide enterprise architecture blueprint was drawn up with an external adviser and named as groundwork for the USD 50m follow-on operation (account). The blueprint itself is not held.	MOVEMENT
Somalia	The e-government strategy records that no interoperability framework exists; the certificate system shows what standard building blocks look like in one service. The strategy for 2025 to 2029 states the federal government lacks an enterprise architecture and interoperability framework, and prescribes standardised solutions with open interfaces, a data-exchange hub and a national enterprise service bus (strategy). The high school certificate system connects registration, identity verification and consent, payments and a digital registry so exam results are retrieved automatically and certificates issued digitally (system). One service built to a pattern is not a published national standard, and nothing states that the next service must follow it.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
South Africa	The Minimum Interoperability Standards and the government-wide enterprise architecture have an update dated September 2026 and nothing published against it. The standing instruments are the Minimum Interoperability Standards and the government-wide enterprise architecture. The only thing the window records about them is a date: the quarterly reform report carries an update due in September 2026. Nothing is published, gazetted or consulted in the twelve months, and no conformance requirement, testing regime or department-level compliance figure appears anywhere on the ledger — which matters more than the slipped date, because a standard nobody tests against is a document rather than a standard.	NO CHANGE
South Sudan	A circular under a presidential order requires the regulator's licensees to integrate with a single national service platform. The circular, issued under the Presidential Order on Digital Government Services and e-Service Integration, mandates technical integration with the national platform for regulatory payments and services (circular). The civil registry directorate separately announced plans in July 2026 to digitise civil registration and link it to the national identity system, coordinating three ministries (plans). Both are sector directives. No whole-of-government interoperability standard, profile or specification is published, and the architecture that would define one is at tender.	MOVEMENT
Sudan	A request for proposals for the instant payment system sets real interoperability requirements; the government platform names the principle without publishing a standard. Version 5.0 of the central bank's request for proposals, dated 7 April 2026, requires interoperability with the existing interbank settlement system and real-time programming-interface integration, alongside enterprise security and compliance standards (document). The ministry's government-institution platform product page names process engineering, smart governance and interoperability as design principles and lists 23 integrated institutions (page). A procurement specification binds one supplier and a product page binds nobody. No published national interoperability standard exists for other systems to build to.	MOVEMENT
Tanzania	A 2016 framework sets nine technical-standards areas for public institutions, joined by an application standard in February 2026. The 2016 interoperability framework defines nine technical-standards areas — interconnection, access, collaboration, data integration and the rest — that public institutions must follow. A board-approved application standard of February 2026 requires secure development-lifecycle controls, vulnerability testing, audit logs and privacy by design for government applications, and mandates open interoperable design with government-controlled source-code hosting. A service directory launched in June 2026 with more than 500 institutions onboarded under a directive to connect to the government service bus. No conformance regime and no compliance count is published against either instrument.	MOVEMENT
Togo	Health insurance is where interoperability standards actually bit: a federated architecture agreed in May 2026 and two systems deliberately converged. A technical workshop at Lome on 4 to 7 May 2026, run by the health ministry with German and World Bank support, settled on a federated architecture for the unified health-insurance management system, naming interoperability standards, medical-data security and governance as the work items and unique patient identification as a precondition. A design decision, not a deployment. On 21 April 2026 the public-sector insurer launched its own platform built to the same architectural and technological standards as the social security fund's and hosted in the fund's data centre, which the fund states is meant to lay the basis for real interoperability between the two managers. The general framework above both remains a draft.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tunisia	The 2020 decree-law makes interoperability compulsory and bars re-asking users for data the platform can reach; no standards catalogue is published. The founding decree-law defines interoperability and the platform, designates the national computing centre as sole operator, requires interoperability to identify persons through the citizen and enterprise unique identifier registers, and bars public bodies from re-asking users for data reachable through the platform. A Council of Ministers session in September 2025 recommended generalising interoperability between ministries and public bodies with mandatory data-exchange linkage mechanisms, and a February 2026 council listed phase one of the national interconnection platform as complete. The technical standards themselves — schemas, protocols, a conformance regime — are nowhere published. A 2023 ministerial order fixes the conditions for awarding, renewing and withdrawing the governmental and national cloud labels, the governmental one requiring connection to the state network and to the interoperability platform (order); the cybersecurity agency's list of 17 September 2026 carried six providers holding the national label.	MOVEMENT
Uganda	A renewed enterprise architecture and interoperability framework was delivered in May 2026, and the government data exchange sits at a 37 per cent agency-integration baseline. Neither renewed document is held, and the rollout is not reported (framework, renewal). The exchange's integration baseline comes from the authority's five-year strategy; two figures for it use different denominators and are not reconciled (exchange, case study). The single sign-on service is described in an undated agency deck, proxy-dated at ingest, so its figures must not be read as current (sign-on). 2026-10-01 - the information technology authority said the platform connects the identity register to more than 150 agencies, banks and telecoms operators.	MOVEMENT
Zambia	Data interoperability standards are mandatory for every ministry, province and spending agency, with an annual compliance audit schedule. The state ICT institute issued public service ICT data interoperability standards that bind every ministry, province and spending agency, and carry an annual compliance audit schedule (standards). Together with the electronic government statute they set the data management and governance requirements for government data (scope). No audit finding, compliance rate or exemption is published, so whether the standards are met is not established - and officials pursuing the statute's amendment still name fragmented, vendor-locked systems as the problem. 2026-09-07 - the trust layer under those standards was stood up: the communications regulator operationalised the National Digital Trust Anchor as national root certification authority, the framework issuing and verifying certificates and signatures establishing the identity of people and organisations on the electronic communications and transactions statute. No certificate count, subordinate-authority list, accreditation route or fee schedule is published, and the launch reaches the repository through a news report rather than the regulator. The national public key infrastructure was launched with a named security vendor, its master cryptographic keys generated under independently audited conditions, held offline and split among multiple custodians so no single entity has unilateral control (launch).	NO CHANGE
Zimbabwe	An enterprise architecture blueprint was handed over in May 2026 and a civil registration and health platform is in build; no national interoperability standard is published. The enterprise-architecture framework built over 2023 and 2024 was handed to government ICT directors in May 2026, with a government service bus announced for once-only data sharing across ministries (handover, priorities). The registrar-general's ICT deputy told the regional registrars' meeting on 18 July 2026 that a secure platform to exchange birth and death notifications is being implemented, with health systems joined through standardised interfaces and automated validation against the national population register; middleware design is due in the fourth quarter of 2026 and a three-province pilot in the first half of 2027 (presentation). A national health information exchange platform went to formal procurement on 29 May 2026, with bids closing on 22 June (procurement). No published national interoperability standard or data-exchange specification is held.	MOVEMENT

National quality standards

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The standardisation body published a draft national work programme for 2026; no count of standards in force is held. The body was created as a public establishment by decree of 21 February 1998, taking standardisation over from the industrial property institute. 2026-02 - it published a draft national standardisation work programme for 2026. It is explicitly a draft work programme, not a record of adopted standards, and the repository holds no count of standards in force, no adoption rate and no conformity-assessment output. The other half of the quality infrastructure, a national accreditation and conformity network with its GEOLAB platform, was announced at the Council of Government in July 2026; neither is measured.	MOVEMENT
Angola	The standards institute is an international correspondent member publishing a 2026 catalogue with 140 new standards, voluntary unless legislation makes them binding. The national body is constituted and active. It is an international correspondent member, formed by the 2021 merger of the standards and accreditation institutes, and it published a 2026 catalogue incorporating 140 new standards, including texts arising from regional harmonisation and covering technology suppliers among other sectors. The institute states that Angolan standards are voluntary and become mandatory only where legislation makes them so in the public interest. Where a technical standard does bind, it binds by sector regulation rather than by the catalogue: the hydrocarbon data delivery regulation is the clearest example on this repository.	NO CHANGE
Botswana	The standards bureau publishes an annual standards-development programme, under a statute in force since 1995. 1995 — the Standards Act establishes the Botswana Bureau of Standards and the Standards Council. 2026-04-16 — issue 341 of the annual standardisation work programme was published, setting the pipeline of standards-development projects. 2025-11-21 — a national quality standard for school uniforms was developed and published, on the minister's account to Parliament. No ICT or data standard from the programme is separately identified in the repository.	MOVEMENT
Burkina Faso	The national standardisation, metrology and quality agency holds the mandate under statutes approved by decree in May 2016. No catalogue of the standards it has issued is held. The decree approves the agency's statutes and establishes it as a public administrative body with legal personality holding the national mandate for standardisation, certification, quality control and promotion, metrology and accreditation. That is the institution; the corpus of standards it has issued is not on the repository, and no information-technology or data standard among them is identified. The one standards act the repository does hold is an addressing one: the agency and the electronic communications regulator signed a framework convention on 4 February 2026 establishing a national object-identifier regime.	NO CHANGE a standing position the repository holds for the first time
Burundi	A national quality policy was adopted in February 2022, and the standards bureau signed a mutual-recognition protocol with a neighbour in August 2025. 2022-02-02 — the Council of Ministers adopted the Politique Nationale Qualite as the government's base instrument for establishing and supervising the national quality infrastructure system, setting its objectives, roadmap and timetable. The policy text itself is not held. 2025-08-29 — the standards and quality control bureau signed a memorandum with the Congolese control office covering exchange of information on standards and quality assurance, metrology, conformity assessment and pre- and post-shipment inspection, with progressive mutual recognition of conformity certificates. No official page carrying the protocol was located, so it is held through trade press.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cameroon	Quality-of-service monitoring platforms were handed to the regulator in January 2026, replacing manual inspection. At the window's opening the regulator issued sanctions off manual inspections, fining two operators in July 2025, with no dedicated monitoring platform on record. 2026-01-07 - platforms were handed over by the national connectivity project and the World Bank, and field inspections of three operators followed at Douala on 13 and 14 April 2026. No sanction is on record since the platforms were handed over, and no measurement out of them has been published, so whether the new capability has changed either enforcement or the reported quality is unestablished. 2026-08-13 - a finance ministry order reclassified the regulator from the third to the second category of public establishments, set on its average realised budget across the 2022, 2023 and 2024 financial years, affecting its institutional standing and pay structure; the order text and the budget figures behind it are not published.	MOVEMENT
Cape Verde	The national standards catalogue runs to 25 standards, all agricultural, fisheries, food or tourism, and carries no information technology, data or information-management standard. The standards body's own catalogue, updated March 2024, lists the whole corpus as NCV 001:2015 to NCV 025:2023 — twenty-one agricultural, fisheries and food product standards issued 2015-2016 and four tourism standards issued 2020-2023. Nothing in it touches digital. Where quality certification appears in the digital record it is an international standard adopted by an individual body rather than a national one: the state port operator states it is pursuing information-security certification for 2026 after achieving quality certification during 2025, and the state technology operator's own certification of its public-key infrastructure remains unrecorded in either its accounts or its plan.	NO CHANGE a standing position the repository holds for the first time
Central African Republic	A spectrum-monitoring system was delivered in June 2025 and a quality-of-service package remains under contract, with a publication site financed and not live. A spectrum contract signed in October 2024 completed in June 2025, and a quality-of-service package signed the same month carries no completion date, unchanged at the February 2026 revision of the procurement plan. The plan's actual-amount column is unpopulated throughout, so no contract value is published. 2026-02-02 — the minister stated the regulator had obtained financing for a website publishing operators' quality-of-service data. No site was recorded live on a third test in July 2026. If delivered it would add a measure of service quality to the regulator's market counts.	MOVEMENT
Chad	The regulator ran the fifteenth cycle of its service-quality audit and inaugurated strategic regulatory platforms described as a shift to continuous data-driven regulation. The fifteenth audit cycle ran September to October 2025 with findings reported in February 2026; the audit reports themselves are not held, and the regulator's own entity page states no penalty it imposed is established, against a held source recording a 2023 fine (audit, upgrades, fibre). The platforms were inaugurated by the minister in June 2026, described by the regulator as a shift from compliance-based to continuous data-driven regulation; no cost, supplier, data-retention rule, legal basis or output is on record (platforms). Fifteen audit cycles with no established penalty, and a new data-driven regulatory apparatus with no legal basis stated, are the two halves of regulation here.	MOVEMENT
Comoros	A two-month quality-of-service control campaign was presented on 26 February 2026, and the regulator has never published a statutory annual report. The 2024 audit measured both operators against twenty-three quality indicators over three months and was presented at a Moroni workshop, with a quarterly bulletin proposed by the minister. Its finding was coverage gaps requiring operators to redouble their efforts. A two-month campaign presented on 26 February 2026 measured twenty-two indicators across the three islands, the regulator placing controls in the two preceding years as well. No 2025 audit and no quarterly bulletin is on file. An annual activity report has been required by statute since promulgation on 2 February 2024, and the regulator's own site states that none has yet been published - an empty series the regulator states itself.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Congo	The regulator's two-month deadline for completing subscriber identification expired around end-2025 with no result on file. Registration is mandatory. A survey of 18 localities found cards sold pre-activated and without identity documents in twelve named towns, with only two localities fully compliant, and the regulator gave the two operators two further months to complete identification. The two-month deadline expired around end-2025 and no compliance result, sanction, follow-up survey or extension is on file. Operators blamed distributors' resellers and undertook to sanction them, and the repository holds no evidence any sanction followed. Quality enforcement went the other way: 2026-04 - the regulator served formal notices on both mobile operators after drive tests in 20 interior localities, with a six-month clock and per-department scores published, one operator absent from fourth-generation service in five named localities against eleven interior localities now covered where none was at end-2024, the next campaign falling due around October 2026.	STALLED
Cote d'Ivoire	Eighty-eight auditors were certified against the state security reference framework, with a further certification announced. Auditor certification is running against the state security reference framework, with 88 auditors certified at an Abidjan-Plateau ceremony and a further certification announced for experts bringing information systems into conformity. The reference framework's own text is not held, so what an audit against it tests is not checkable from anything on file. No register of certified auditors, no list of systems audited and no conformity finding has been published, and nothing states whether certification is a condition of anything.	MOVEMENT
Djibouti	The standards agency operationalised two technical standardisation committees in 2025, its first sectoral standards capacity on file. The agency is a public industrial and commercial establishment charged with contributing to policy on standardisation, metrology, certification, accreditation and quality promotion, organised by decree in 2022. 2026-01-13 - the Council of Ministers records that two technical standardisation committees, for agri-food and for electrical and household products, were operationalised during 2025, and approves a 2026 budget of 134.9 million FDJ against 112.1 million in 2025, including 54.4 million of investment in software, equipment, laboratory fit-out and vehicles. The agency's two founding laws are not held, and no standard published by the committees appears on file.	MOVEMENT
DR Congo	The regulator installed service-quality monitoring equipment and the minister ordered operators to return units consumed without justification (order). The posts and telecommunications minister ordered the four mobile operators to return units and megabytes consumed abnormally or unjustifiably by their subscribers (order), after inspecting monitoring equipment acquired to trace service-quality failures (inspection). A 2023 decree created a successor regulator, but a joint press investigation reports it has never been installed, leaving the older authority to police service quality it is accused of failing to enforce.	MOVEMENT
Egypt	A 2025 national standard adopts the international smart-metering data-exchange standard, on a default to international standards. The body is the sole official one for preparing and issuing national standards, founded by presidential decree in 1957. A ministerial decision of 2022 provides that where no national standard exists, an international or foreign standard applies, from a named list - a default that makes the national catalogue a supplement rather than a gate. 2025-10 - the register carries a national standard adopting the international smart-metering data-exchange standard, giving electricity metering a common exchange basis.	MOVEMENT
Equatorial Guinea	A service-quality regulation of 2018 is confirmed in force through the regulator's own index, with only its title and date held. The index also lists an inspection and sanctions regulation of 2020 and a broadband-market update of February 2026, neither captured separately (regulatory index). So the country has published quality-of-service rules and the repository cannot read them; no measurement, inspection outcome or sanction under any of the three is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Eritrea	Standardisation rests on the 1995 proclamation establishing the standards institution as sole national organ (proclamation). The Eritrean Standards Institution was established by proclamation in 1995 as an autonomous body with legal personality and the sole national organ for standardisation, quality assurance and metrology, with powers to prepare compulsory Eritrean standards, affix conformity marks, test and certify import and export products, and inspect (proclamation). Nothing in the window amended that proclamation, and the repository holds no Eritrean standard made under it that bears on digital systems, data formats or interoperability. The institution exists and its output in this field is not on the record.	NO CHANGE
Eswatini	Nineteen new national standards were designated in 2025 and certification cottage factories began construction in December. The standards authority is constituted by an Act assented in 2001; a 2025 account of the new designations cites a later Standards and Quality Act of 2023 as the enabling statute, and that Act is not held (Act). Nineteen new national standards were designated across electricity, fuel facilities, liquefied petroleum gas, food production, beverages, climate change adaptation and household consumer products (designations). Construction began in December 2025 on certification cottage factories at Lugongolweni under a scheme aimed at conformity for the smallest producers (factories). No count of certified organisations, and no conformity-assessment accreditation, is published.	MOVEMENT
Ethiopia	National livestock data standards have been endorsed and cascaded through training of trainers to more than 300 experts and collectors. The standards were developed with the agriculture ministry, endorsed, and then cascaded on a training-of-trainers model (livestock data standards). They underpin a livestock information system drawing on five priority databases, which repositions animal identification from an export tool to a national asset register and links it to disease surveillance and vaccination records (the same account). The account is the implementing organisation's own, after four years with a team embedded in the ministry, and is uncorroborated in the repository. 2026-09-06 - a standing readiness instrument the repository had not held was named from practice: a central bank microfinance directive of 2022 already defines the governance, risk-management and operational readiness institutions skip when they buy digital wallets before building the capability to run them. The directive text is not held, and no supervisory finding or compliance count is published.	MOVEMENT
Gabon	At a departmental capital the incumbent sells data bundles on a network whose coverage comes and goes while validity runs down normally. Reporting of 25 August 2026 sets out prepaid credit and bundle validity running against a service that intermittently is not there, and puts the regulator's inaction to the president of its regulatory council (service quality). No regulator decision, quality-of-service determination or sanction is published, so the obligation is asserted in reporting and nowhere else in the repository.	REGRESSED
Gambia	The standards bureau reports around 500 standards adopted, on a catalogue thin in information technology. The 2022 catalogue sets out the national register by classification, and the technology classes in it are thin. The bureau's director general put adoptions at around 500 standards when the international standards body's secretary general visited in July 2026, alongside membership of the African standards organisation. No count of information-technology standards specifically is published, and no national conformity-assessment output is on the record.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Ghana	The standards authority Act of 2022 is in force, and a metrology institute project entered its second phase. The founding statute came into force on 30 June 2022, establishing the standards authority and its mandate for national standardisation, conformity assessment and metrology, and was amended by the accreditation service Act of 2023. 2026-03-19 - the authority and a German partner institute held a steering committee on the second phase of a project to modernise the metrology system toward a self-sustaining, internationally recognised national metrology institute. The Act's operative text is not held - the legal database's viewer failed on two attempts and only the citation and history page was captured - so what the mandate obliges in detail rests on the citation rather than the text.	MOVEMENT
Guinea	The national standards body was given its attributions by decree in January 2023 and no catalogue of standards it has issued is held; statistical quality moved, with national accounts rebased from 2006 to 2018. The institution exists: a public administrative establishment with legal personality and financial autonomy whose mandate covers drafting national standards or adopting foreign and international ones, publishing and promoting them, running laboratories, operating the national conformity mark, metrological control and calibration certificates, and participating in the national accreditation system. The record is a press transcription of the decree read on television rather than the gazette text, and no catalogue of issued standards is held. 2025-10-19 - the statistics institute, with support from four international institutions, completed a rebasing of national accounts from 2006 to 2018, raising measured output by 51.2 per cent and widening coverage from 34 branches and 54 products to 104 branches and 187 products, bringing in the informal sector, financial services, research and digital activity. The methodological note is not published. 2026-04 - the monthly price bulletin uses the regional harmonised methodology on a 2019 base with national coverage across all eight administrative regions, 5,619 points of sale and 14,522 monthly readings.	MOVEMENT
Guinea-Bissau	The minister signalled a plan for a national quality and metrology institute in October 2025. Guinea-Bissau has no national standards body in the repository. The announcement of October 2025 is a ministerial signal of intent to create a quality and metrology institute, with no statute, budget or premises attached. Until one exists, standards reach the country through adoption rather than issuance — as with the common alerting protocol operationalised in May 2026.	MOVEMENT
Kenya	Equipment vendor and public access centre licence conditions were gazetted in August 2026, and a distributor licence made mandatory before type approval. The vendor conditions carry a twelve-month minimum warranty, returns, after-sales support and record-keeping duties, and both categories were gazetted in the same notice after public consultation, effective 30 days from it and published for free download (gazette notice, consumer protection). A separate distributor licence is mandatory before equipment type approval and customs clearance, at KSh 1m or three years for non-compliance; fee, holding threshold and grandfathering are unestablished and the gazette notice is not held (distributor licence). 2020-01-13 - the ICT Authority's government data-centre standard, second edition, took effect on 1 February 2020, setting design, power, cooling and security requirements for public-sector data centres with quarterly compliance audits of ministries, counties and agencies; no audit result is cited on the ledger.	MOVEMENT
Lesotho	Quality-of-service rules have been in force since 2023, and the regulator's own testing puts compliance at 75 per cent with speeds far below target. Legal Notice No. 41 of 2023 came into force on 21 April 2023, prescribing minimum quality-of-service standards for voice, data, postal and courier licensees across accessibility, integrity and retainability, with two published schedules of measurable parameters (rules). The two mobile operators reached 75 per cent overall compliance across twelve general parameters in the year to 31 March 2025, missing on disconnection-complaint resolution time and mobile order-completion time (annual report). Drive-testing across three Maseru clusters in November 2025 found mean download speeds of 2.88 to 2.95 Mbps against a 25 Mb/s target, and unsuccessful call ratios of 2.6 to 6.2 per cent against a 2 per cent ceiling (testing).	MIXED quality-of-service rules in force and measured, with two parameters missed and speeds far below the target

COUNTRY	DEVELOPMENTS	PROGRESS
Liberia	The Liberia Standards Authority has been the apex national standards body since its enacting Act of August 2022. The Act signed 5 August 2022 creates the authority as the apex national standards body, grounded in the ECOWAS quality infrastructure and World Trade Organization technical-barriers obligations. The repository holds no standards catalogue, no accreditation record and no conformity-assessment output from the authority since. The capture of the Act itself is an excerpt, the source scan having yielded only the preamble and enacting clause.	NO CHANGE
Libya	The standards body adopted its 2026 plan, new specifications and a quality mark rule in February 2026. The governing statute is Law 5 of 1990, which creates the standards centre and makes its standards binding nationwide, with a penalty ceiling frozen at LYD 1,000 since enactment. The centre's supreme committee reviewed the 2025 annual report and adopted a 2026 plan, new specifications and a quality mark licensing rule in February 2026. No count of information technology standards adopted is published.	MOVEMENT
Madagascar	The national standards bureau is the standing body; certification activity in the window was a private firm's. The bureau operates under a governing decree of 2014, having been founded in 1998 (bureau). A domestic digital infrastructure and cybersecurity firm obtained three international management standards certifications and a payment card security standard in July 2026 (certification). A digital readiness assessment handed to government in December 2025 identified alignment of digital infrastructure and cybersecurity with international standards as an outstanding need (handover). No national standard for digital services, procurement or accessibility is held.	NO CHANGE
Malawi	The standards bureau's accreditation to certify quality management systems was renewed from 14 December 2025. The institution is statutory: the Bureau of Standards Act establishes the bureau and the standards board as the national quality-infrastructure body. 2025-12 - the regional accreditation service renewed the bureau's accreditation to certify quality management systems under the international conformity-assessment standards, effective 14 December 2025. That is the certifier being certified, which is what a national quality infrastructure rests on. 2026-02 - a national validation workshop on the draft digital transformation and artificial intelligence strategies pushed common government technology standards. No count of standards issued, adopted or withdrawn is published, so the institution is on the record and its output is not.	MOVEMENT
Mali	The standards agency's draft 2026 budget is about a quarter lower, at CFA 243.3m, and it is the international standards organisation's member body for the country. The agency was created by ordinance n. 2012-016/P-RM of 19 March 2012 (ordinance); its fourteenth ordinary board session, in January 2026, was submitted a draft 2026 budget balanced at CFA 243,306,303 against CFA 318,369,036 in 2025 (budget). No standard adopted, certification issued or staffing figure is published, so what is measurable about the agency is the money, and it is falling.	REGRESSED
Mauritania	Decree 2023-113 created a national standardisation council and an accreditation committee and set the terms for accrediting conformity assessment bodies. The decree of 7 September 2023 creates the National Standardisation and Quality Promotion Council and the Mauritanian Accreditation Committee (decree). No membership, meeting record, accredited body or published standard is held for either institution, so the instrument exists and nothing on the record shows it working.	MOVEMENT
Mauritius	The standards bureau made two instruments inside two months in 2026 — a certification mark and appliance efficiency standards. The bureau's last published annual report covers 2021 to 2022 (report). Certification mark regulations were made in April 2026 (regulations), and minimum energy performance standards for refrigerating appliances in May (regulations). No standard for digital services, procurement or accessibility is held, and no annual report later than 2021-2022 is on file, so the bureau's current throughput cannot be read.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Morocco	Median mobile speeds fell through the first six months of 5G, and the quality-of-service annex of the licences is withheld as confidential though binding. A measurement firm's series puts the 5G median down 38 per cent from 261.7 Mbps at launch to about 160 to 165 Mbps at month six, the 4G median down 28 per cent, and the combined median at 44.59 Mbps against 44.4 Mbps a week before launch (measurements). Three licences were awarded and gazetted individually, and the specification's five annexes on shareholding, frequencies, coverage engagements, quality of service and interference procedure are withheld as confidential though binding, with the Arabic text prevailing in court (licences, tender). The regulator stated it would assess operators after the first operational year.	MIXED published median speeds fell through the first year of 5G while the binding quality annex of the licences stays confidential
Mozambique	Mandatory conformity certificates were extended to an enlarged import list from 1 June 2026, and communications complaints reached 391,723 in 2025, up 44 per cent. 2026-05-07 - the economy ministry and the standards institute extended the mandatory certificate of conformity to rice, fortified foods, used vehicles, tyres and construction steel from 1 June 2026, widening enforcement scope rather than making a new instrument. The frame is unchanged: Decree 8/2022 sets the institute's mandate and the process for Mozambican technical standards. No count of standards issued, certificates granted or conformity failures is published. 2026-09-09 - in communications the position is now measured. The regulator's 2025 consumer protection report, held first-hand, records 391,723 complaints in 2025, up 44 per cent on 2024, with 372,846 of the telecommunications complaints resolved, a 95.2 per cent resolution rate, against an average satisfaction index of 82 per cent. The regulator attributes much of the rise to better recording rather than worse service, naming one operator's technology migration and another's incident-tracking deployment, which took that operator's logged complaints from 213 to 24,036 - which makes the two years not comparable. Two instruments sit behind it, Decree 73/2025 on consumer protection and Decree 74/2025 on dispute resolution, in force from 1 March 2026 - so the 2025 figures ran under the earlier framework.	MIXED the conformity regime widened its mandatory scope and communications consumer rules were made, while recorded complaints rose 44 per cent
Namibia	The standards institution has published 235 standards since 2008 and a 2025 strategy targets 1,200 more in three years. The Standards Act of 2005 establishes the institution and its council (Act). A national standardisation strategy launched in October 2025 targets 1,200 new standards over three years, against 235 published since the institution's establishment in 2008 — set beside 1,600 in Botswana, 6,500 in Zambia and more than 10,500 in South Africa (strategy). A package covering chilled seafood, marketing quality, laundry and refrigerating appliances was adopted in June 2026 (adoption). None of the standards named on this repository is an information technology standard. The target is five times the output of eighteen years, and no progress figure against it is published. 2026-09 - a harmonised government communication strategy for 2026 to 2030 and a corporate brand identity manual were launched; no compliance requirement on ministries is stated.	MOVEMENT
Niger	Formal notices were served on all four operators in June 2026 with fines of 1 to 3 per cent of turnover in prospect, while the threshold values in the governing decision are not published. Voice and mobile-data quality was found deficient at all four operators in the April to May 2026 control, with only messaging compliant and one operator additionally below 4G coverage thresholds; a verification campaign ran to 28 August 2026 (control, notices). Formal notices carry fines of 1 to 3 per cent of prior-year turnover, licence suspension or withdrawal in prospect (enforcement, notice). The 2021 decision every enforcement action cites is not published: the regulator's own annual report gives its function but not its threshold values, and the regulator's site does not surface the 2026 notices either (report, site). A continuous monitoring platform inaugurated in January 2026 gives the regulator real-time visibility of operator networks (platform).	MIXED all four operators served with formal notices on quality while the thresholds they are judged against are unpublished

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	A digital infrastructure assurance framework was issued with four certification classes, commencing 2027, electronic Type Approval enforcement for SIM-enabled devices was announced, and the web design standards have published no toolkit a year on. A draft hub standards framework gives innovation hubs a self-assessment tool across seven dimensions, validated against a count of more than 339 hubs concentrated in two cities (hubs). The compensation framework binds mobile operators and fires where the commission confirms a missed quality target in a named local government area; the directive instrument is not published and the qualifying thresholds are referred out to regulations the repository does not hold (compensation). 2026-08-31 - the web design standards, launched in July 2025 with a toolkit promised within eight to ten weeks, had published none by August 2026, and two publications found no evidence of approval or implementation. No revised timetable is published. 2026-09-10 - the communications regulator moved a statutory standard onto a platform, announcing electronic Type Approval determination for SIM-enabled devices under section 132(2) of the Nigerian Communications Act 2003, supported by a Device Management System, and stated the same week that the platform gives it no access to users' personal data or communications. The board then stated it live, at about N670 per IMEI. The assurance framework's text is now held: version 2.0, effective 1 January 2027, mandatory for public procurement and setting four certification classes.	MIXED a device compliance framework and three others advanced while the web design standards stalled with no toolkit published
Rwanda	Standards from two 2025 board sessions were gazetted in November, and the board signed cross-border recognition arrangements in March 2026. The standards board operates under a 2013 constitutive law mandating it to set and publish national standards (law). Standards approved at its April and August 2025 board sessions were gazetted on 20 November, spanning agriculture, food, packaging, chemicals and cosmetics (gazette). One entry, on information technology and multimedia, is the only digital item in the catalogue. In March 2026 the board signed mutual recognition arrangements with the Congolese and Zimbabwean bodies, on a one standard, one test, one certificate basis (arrangements).	MOVEMENT
Sao Tome and Principe	The national quality body is an autonomous public institute under the finance ministry covering industrial property, standardisation, certification and accreditation. The body states that it has administrative, financial, technical and asset autonomy under the ministry responsible for industry, and that its functions include proposing policies on industrial property, copyright and related rights, standardisation, certification and accreditation (body). No national standards catalogue, accreditation register or published certification scheme is held, so what the mandate has produced cannot be read here. The page carries no date and the year is inferred.	NO CHANGE
Senegal	A decree on classified defence procurement was signed in April 2026, its stated direction control rather than expansion because administrations were invoking the classification improperly. The decree was signed on 22 April 2026 and published in the official journal a week later (decree). The accompanying report says administrations were invoking the classification improperly, so the instrument narrows a route that had been used to avoid open procurement. It is relevant here because the state's own diagnosis locates the blockage on critical-infrastructure cybersecurity in procurement rather than in budget or capability.	MOVEMENT
Seychelles	The Seychelles Bureau of Standards gained a new board from August 2025 and accredited mass-calibration capability in September. The Bureau is constituted under Act 2 of 2014, commenced in June 2014 and amended in 2016 and 2021, whose 36 sections set the Board, the standards-making procedure, offences and penalties (Act). A new eight-member Board was appointed for three years with effect from 1 August 2025 (gazette), and the regional accreditation service's register shows the Bureau's mass-calibration capability approved on 15 September 2025 and valid to 14 September 2030 (register). No count of national standards adopted, and no annual report of the Bureau, is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Sierra Leone	The Standards Bureau holds 204 national and 156 regional standards, and an open-source software policy binds the public sector with no recorded application. The bureau's standards department publishes and promotes standards, and its own overview records 204 national and 156 regional standards, most adopted from international bodies (overview); the trade ministry warned importers in November 2025 to meet new iron rod standards (enforcement). The open-source software policy was approved in 2025 and reaches the repository through coverage of a university curriculum event (policy). No implementation guidance, compliance route or procurement decision is recorded under the software policy, and no digital or data standard appears in the bureau's published set.	NO CHANGE
Somalia	The operative quality instrument is type approval for terminal equipment, mandatory since July 2020 and tested against European and international standards. Issued under Article 59 of the Communications Act 2017, the guidelines require regulator approval before radio and telecommunications terminal equipment — handsets, network equipment, radio and satellite gear — is marketed or used (guidelines). The filename and hosting path indicate a later republication, but the captured text carries no separate revision, so the 2020 issue is what the repository can state. Nothing else the repository holds sets a national quality standard for a digital service, and no service-quality regulation for telecommunications exists outside the consumer-protection draft now in consultation (consultation).	NO CHANGE
South Africa	A Digital Public Services Standard sets a national lifecycle and quality baseline, and biometric and cryptographic standards went out for revision. 2025-08-04 — a Digital Public Services Standard was issued under a public service circular, setting a national lifecycle and quality baseline for digital public services covering accessibility, security, ethics, testing and quality assurance, deployment and retirement. Nothing of the kind existed before it, and no compliance report, assessment or departmental adoption count has been published against it. 2026-04-17 — the standards body put drafts out for comment on biometric performance testing, biometric information protection and cryptographic module testing, revising the biometric interface and identification-card standards and proposing one service-management standard for withdrawal. The sequence is worth noting: the standards that would govern biometric quality are being revised while the biometric systems reported elsewhere in this document are already in service.	MOVEMENT
South Sudan	The standards bureau is developing a metrology framework to verify mobile data consumption independently. The bureau announced at World Metrology Day in May 2026 that it is building a regulatory and metrology framework to measure and verify mobile data consumption, coordinating with the communications regulator before engaging operators (framework). Its constituting statute gives it a council, standard-setting powers and conformity assessment and quality-mark functions (Act); the communications regulator's incident response team adopted a National Cyber Incident Management Framework in November 2025 on central coordination, mandatory reporting and national visibility (incident framework). Independent verification of what an operator bills for would be the first consumer-facing quality standard in this repository. It is at planning stage.	MOVEMENT
Sudan	A telecommunications service quality regulation was gazetted in March 2026, and the standards body publishes an adopted catalogue against international equivalents. The regulation gazetted on 15 March 2026 was made under the Telecommunications and Post Regulation Act 2018 with the minister's approval and repeals the 2021 quality-of-service regulation (gazette). Its substantive quality provisions from page seven onwards are not held. The national standards body publishes a catalogue of adopted Sudanese Standards with their international equivalents, under the Standards Act of 2008 (catalogue). It is cross-sector rather than an ICT list. In July 2026 the body began taking certification fees through the government payment platform (integration).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tanzania	A digital trust initiative was launched at an inaugural forum by a private-sector-founded body naming public regulators as partners. No constitution, funding, membership list or statement of the regulators' role in it is held (initiative, sandbox). A private body naming regulators as partners, with no published account of what that partnership commits either side to, is worth recording as exactly that. 2026-09-09 - Zanzibar's government told its House of Representatives a guideline on shared fibre poles and a single fibre contractor is being prepared, after each provider put up its own.	MOVEMENT
Togo	A decree instituting a national conformity-assessment mechanism was adopted in July 2026 with no number, text or entry-into-force date held, at the same session as a fee and royalty amendment. The conformity decree was adopted in Council of Ministers on 30 July 2026 and nothing about its content is published (decree). The 2023 electronic-communications fees and royalties decree had one annex table amended at the same session; the held copy is an image scan with no text layer, so the rate tables are not machine-readable (fees, amendment). Two instruments adopted in one session, neither readable, is a recurring condition in this unit rather than an accident of one meeting. 2026-08-31 — the National Accounting Council was launched in Lomé, the body a regional directive of 28 November 1997 requires each member state to establish, tasked with making accounting information reliable, comparable and consistent with international standards (launch, directive). Twenty-nine years between the obligation and the institution is the finding; unlike the two July decrees, this one has a named text behind it. 2026-09-25 - the telecoms regulator is drafting rules requiring at least 95 per cent nationwide quality-of-service compliance, with penalties; no draft is published.	MOVEMENT
Tunisia	A public enquiry on measurement and cable standards opened in May 2026, under a 2009 standardisation law. The 2009 law founds the national standardisation system and establishes the standardisation and industrial property institute to manage standard-setting, certification and conformity marking; it was amended in 2016 and replaced a 1982 statute. The institute opened public enquiry 441 from 25 May to 24 July 2026 on draft national standards transposing the international measurement-management, accuracy and uncertainty-of-measurement series and cable standards. A twentieth bilateral working group on mutual recognition of conformity certificates with Libya concluded in December 2025 — the repository's only record of Tunisian conformity assessment recognised across a border, running bilaterally rather than through the regional treaty. No count of published national standards, and no digital-specific standard, is held.	MOVEMENT
Uganda	The standards body reported to the trade minister for FY2024/25 and was directed in August 2026 to cut certification turnaround for small firms; a compulsory-standards notice is out for objection. 2025-12 - a preliminary notice was published under section 20 of the standards Act, the National Standards Council stating it intends to recommend standards for compulsory application, with 60 days for written objections and a right to be heard before any declaration. Nothing on the list is recorded as declared. 2026-08 - the trade minister directed the standards body to improve certification turnaround for small and medium-sized enterprises and to clear substandard products from the market, with no turnaround figure, target or deadline stated. On the digital side the technology ministry will standardise information and communication technology indicators and definitions with the technology authority and the statistics bureau, with no standard, indicator list or adoption instrument held for the work. The FY2024/25 annual report was submitted under section 40 of the Act (report); no certification volume or turnaround series is extracted into this repository.	MOVEMENT
Zambia	Quarterly network-performance reporting was announced, and a provincial minister names four districts where poor service blocks access to social cash transfers and farm input subsidies. Both regulator items behind the enforcement regime are paywalled ledes (reporting, disruption, action). Naming districts where poor service blocks social cash transfers and farm input subsidies makes quality of service a benefits-delivery question rather than a consumer one. Health ministry ICT standards issued in January 2014 are the oldest instrument in this ledger and the only national sectoral data standard the repository holds for the country (standards).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zimbabwe	The first National Quality Policy has lapsed, and the industry minister said in May 2026 that a replacement framework is in its final stages. The first policy set out the national quality infrastructure, identifying the national standards body and proposing its rebrand and re-legislation (policy). The industry minister said on 8 May 2026 that a replacement National Quality Policy Framework is in its final stages, developed through consultations with industry, academia and regulatory commissions, and that a National Accreditation Board is being established (replacement). The minister dates the first policy's expiry to 2023, where the document the repository holds is titled 2021-2025. Neither the replacement framework nor an instrument constituting the accreditation board is held.	MOVEMENT a replacement framework still in drafting after the first policy lapsed

Adoption of international standards

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	eSIM adoption is under way across the operators, and a national accreditation and conformity network was announced. No eSIM offer was on record at the window's opening; adoption has been under way across the operators since October 2025, with no subscriber figure, tariff or launch date published for any operator since. 2026-07-23 - a national accreditation and conformity network and its testing platform were announced at the Council of Government, with no instrument, scope or commencement stated. Both are announcements of intent to conform rather than conformity achieved, and neither has a published standard behind it.	MOVEMENT
Angola	Domestic payments completed migration to the international messaging standard in July 2026, across the switch, the exchange and settlement participants. The clearest adoption of an international standard in the window is in payments: the central bank completed migration to the international messaging standard across the switch, the exchange and the real-time settlement participants in July 2026. That is a whole national system moved onto a global format. Elsewhere adoption is institutional rather than technical. The standards institute is an international correspondent member whose 2026 catalogue incorporates texts from regional harmonisation, and the meteorological service is required by its modernisation contract to register with the European meteorological satellite organisation to receive its broadcast stream.	MOVEMENT
Benin	The national standards agency is recorded as a full ISO member and operates the NB conformity mark. The Agence Nationale de Normalisation, created by Decret 2017-031 of 23 January 2023, is recorded as a full member of ISO. It launched the national NB conformity mark in April 2026 and published standards for solar photovoltaic equipment the same month. No standards catalogue, certified-product count or ICT-specific standard is held.	MOVEMENT
Botswana	A candidature for the international radio regulations board is being promoted with member-state lobbying; the election has not been held. 2026-05 — a candidature for the international radio regulations board was promoted at a regional preparatory meeting, with member-state lobbying under way for the 2027-2030 term. The election has not been held and no baseline was held before this. It is the only standards-body engagement on this ledger. Domestically the picture is the opposite: no national address-protocol transition plan, target date or measured adoption figure exists, only a regulator training workshop, so a country seeking a seat on an international standards board has no published standards programme of its own.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Burkina Faso	A national object-identifier regime was established by framework convention on 4 February 2026, with a joint letter of recognition issued to the international telecommunications and standards bodies. 2026-02-04 - the standards agency and the electronic communications regulator signed the convention, designating the regulator's secretary executive as national object-identifier registration authority and issuing a joint letter of recognition to the international telecommunications union and the international standards organisation. It is the clearest instance the repository holds of a national addressing standard aligned to an international framework. It is also load-bearing for something else: the regulator allocated an object-identifier sub-arc to the national cybersecurity agency in February 2026 as a building block for a public-key infrastructure, certificates and electronic signature. Elsewhere, adoption is asserted rather than evidenced: the interoperability reference framework was adopted by prime-ministerial order in May 2018 without a published conformance test, and no accreditation of the national standards body by an international peer is held.	MOVEMENT
Burundi	628 of 690 harmonised regional standards are adopted, 91 per cent, and the payment system migrated to ISO 20022 in February 2026. Burundi has adopted 628 of 690 harmonised East African standards and not adopted 62, a rate of 91 per cent and the highest of the six partner states, on a catalogue drawing on international standards among others. It is a first count with no earlier figure behind it, so the level is stated and the direction is not. 2026-02-05 — the central bank completed migration of the national automated transfer system to ISO 20022, with interbank operations resuming on the new system the following day, stated to ease integration with regional and international payment and settlement systems. It is the clearest instance on this ledger of an international standard being adopted into a working national system rather than into a catalogue.	MOVEMENT
Cameroon	The regional switch renewed its PCI DSS v4.0.1 certification in March 2026, and device certification guidelines were issued. 2026-03 - the sub-region's electronic-transaction processor renewed its PCI DSS v4.0.1 certification for the infrastructure on which it processes and transmits bank-card data, the certificate issued by an external assessor. It is a regional body's certification, carried here because the national switch traffic runs through it. 2025-11-10 - the regulator issued certification guidelines for devices sold in Cameroon under its digital-safety campaign, which precede the import-duty regime that followed in April 2026. No conformity register, test regime or enforcement finding has been published against either.	MOVEMENT
Cape Verde	ISO 27001 certification of the state operator's public-key infrastructure, committed in its 2024 plan, is unconfirmed. Certification was committed in the operator's plan for 2024 and funded from its own trading account, and neither the FY2024 accounts nor the FY2026 plan record it as obtained. The country-code domain management system, launched by the regulator in May 2024 with a designated body handling all registrations, is likewise unchanged, with no registration volume, fee schedule or operational report held. The two are the only international-standard or internet-governance commitments the repository records for this country, and neither has produced a published result.	NO CHANGE
Central African Republic	A diagnostic against 19 international statistical quality principles was finalised in May 2026. The clearest earlier instance is the enhanced general data dissemination standard implemented through a national summary data page. 2026-03-24 - a workshop validated a national data management, processing and dissemination policy governing quality standards and sharing mechanisms. 2026-05-15 - a restricted workshop finalised a diagnostic against 19 international statistical quality principles, feeding a future national quality assurance framework. All three are statistical; no technical, security or interoperability standard adoption appears on this ledger.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Chad	The standards agency's committees adopted ten international standards as draft national norms across three sessions in July and August 2026. The standardisation law creates the agency, a national quality council and an interministerial regulation committee, and charges the agency with turning international standards into national ones (law). Three dated adoption sessions fall in the window: the national electrotechnical committee on 31 July 2026, the quality management systems committee on 5 August adopting ten international standards as draft Chadian norms, and the petroleum products committee on 7 August (sessions). In March 2026 the agency signed a cooperation protocol in Paris with the French standards body to structure the national system and align it on international standards (protocol). No published register of Chadian standards in force is held.	MOVEMENT
Comoros	The country-code domain registry has sat in a stated transitional arrangement for fifteen months, re-delegation incomplete. The registry transferred from the incumbent operator to the digital agency overnight on 6 to 7 May 2025 under a ministerial order of 29 September 2024, with physical equipment still hosted at the incumbent and re-delegation to the international body pending. Unchanged: the re-delegation is not recorded as completed and the announced online registration platform is not recorded as deployed. Fifteen months in a stated transitional arrangement, and both accounts derive from the same agency communique, so the country's own top-level domain is described by one source and confirmed by none.	NO CHANGE
Congo	The state operator became the first telecommunications operator in the country to hold the international quality-management standard. No operator held the standard at the window's opening. In March 2026 the state operator was certified, the first telecommunications operator in the country to hold it. It is company-reported and carried by a wire outlet, with no certification date distinct from the publication date and no auditor named. It is also the only international standard adopted by anything on this ledger: no national standards body, conformity regime or certification requirement for digital systems appears anywhere else, the one exception being the invoicing homologation the security agency now runs.	MOVEMENT
Cote d'Ivoire	A labour-market platform built to the SDMX statistical standard was launched, and national series are being harmonised to regional databases. 2026-06-23 - the national employment and training observatory launched an SDMX-compliant platform carrying 134 of an identified 315 indicators across 14 themes, 91 of them published in 299 statistical tables disaggregated by sex, age, education, residence and region, built with ILO technical support and World Bank financing. 2026-08-18 to 22 - the ECOWAS workshops at Abidjan took up updates to the ECOMAC and ECOBASE databases and harmonisation of national series for 2000-2025. Nothing on file states which Ivorian series were harmonised or by when.	MOVEMENT
Djibouti	Risk-management training on an international security standard was delivered to government and critical-infrastructure staff in December 2025. 2025-12-16 - the telecommunications union's regional office delivered three days of ISO/IEC 27005 risk-manager training in Djibouti for government, critical-infrastructure and ICT-sector participants, covering risk context-setting, identification and evaluation. The route by which a standard becomes binding runs through the standards agency, whose two technical standardisation committees began operating in 2025. No adopted international standard is named in any instrument on file, and no certification or accreditation issued against one appears in the record.	MOVEMENT
DR Congo	The Kinshasa carrier-neutral facility holds information-security, continuity and payment-card certifications, unchanged in the window. The facility has been live since August 2024 as the country's first Tier III certified data centre, certified to information-security, continuity and payment-card standards, and now also hosts the internet exchange's second presence. The certifications are not re-verified in the repository and no recertification date is held. They are also the only international standards adopted by anything on this ledger: no national standards body, conformity regime or certification requirement appears anywhere, so a private facility's commercial certifications are the whole of the position.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Egypt	The central bank formed an inter-ministerial working group on a sustainable finance taxonomy on 7 August 2026. Nothing of the kind was held at the window's opening. 2026-08-07 - a taxonomy is under development by an inter-ministerial working group formed by the central bank with the finance, investment, environment and financial-regulatory authorities, ahead of official issuance. No draft text, reporting obligation, data requirement or issuance date is stated. It is the only standards instrument of any kind on this ledger, in a country whose transfer-pricing guidance has not been revised since 2018 and whose accessibility work exists as a toolbar on one ministry's own website.	MOVEMENT
Equatorial Guinea	The backup data centre works are tendered to an international facility standard, and the passport follows the regional chip specification. Two adoptions are documented. The biometric passport regulation sets chip, machine-readable zone and issuance-control rules to the regional specification, and the technical oversight tender for the backup data centre names an international facility standard. The statistical system is adopting one too: the technical committee began rolling out the 2008 national accounts standard and updating the base year in March 2026.	MOVEMENT
Eritrea	The 1995 standards proclamation adopts the international system of units as the legal measurement system (proclamation). The proclamation establishing the Eritrean Standards Institution expressly adopts the International System of Units as Eritrea's legal measurement system (proclamation). A structured government-technology dataset for 2022 records no government enterprise architecture framework, no government interoperability framework and no data quality framework (dataset). So metrology is aligned to international standards and government data practice is not; nothing on the repository records adoption of an international standard for identity, payments or data exchange.	NO CHANGE
Eswatini	The standards authority's IT catalogue lists 28 domesticated ISO standards, and national addressing standards were launched in July 2026. The information-technology catalogue lists 28 standards domesticated under the SZNS designation, among them the ISO records-management standard and the Dublin Core metadata element set (catalogue). The Eswatini National Addressing Standards, the ISO 19160 parts 1 and 2 domesticated as SZNS, launched on 20 July 2026 with the communications regulator and the ICT and housing ministries (launch). Ten days earlier the authority certified the revenue service to the domesticated ISO 9001 quality management standard (certification). Domestication is running ahead of certification: the catalogue is a shelf of adopted standards, and the repository records one certified public body.	MOVEMENT
Ethiopia	The national identity is built on an open-source international platform and is among its furthest-advanced national deployments. The platform is modular open source under the Mozilla Public Licence, incubated at a research institute in Bangalore, and the Ethiopian deployment is among its furthest advanced (platform account). That adoption is the repository's clearest evidence of an international standard taken up, and its only one: no conformity assessment, standards-body membership or certification against international instruments is on the record.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Gabon	Adoption is selective and legally mediated: an order makes nine national standards mandatory, three of them national transpositions of an international standard, with conformity certified by the national agency. The order makes nine national standards mandatory across the territory, among them three national transpositions of an international standard for steel in concrete, and requires certification of conformity by the national standards agency. It is taken under the 2014 statute instituting the national standardisation system and the decree creating the agency. The mechanism is the finding: a standard becomes binding when homologated as a national standard and given effect by order, sector by sector. Nothing is adopted wholesale, and the one sector where the mechanism has been used is building and civil engineering. No information-technology, data or information-security standard has been put through it, and no national interoperability standard exists to be homologated. 2026-09-10 - the regional internet registry presented its mission and programmes to the technical community at a workshop in Libreville held at the initiative of the national internet exchange point, the session focused on the transition to IPv6 as IPv4 addresses run out. It is an awareness session, not a transition: no national IPv6 strategy, operator deployment figure, allocation count or timetable is published for this country.	NO CHANGE a standing position the repository holds for the first time
Gambia	The bureau holds Correspondent membership of ISO and membership of IEC and is the trade-barriers enquiry point. The international standards body's own member profile records the bureau as a Correspondent member of the standards organisation and a member of the electrotechnical one, and as the country's technical-barriers enquiry point under the trade agreement. In telecommunications the adoption that has happened is regional rather than international, through the roaming regulation implementation memorandum of December 2025. 2025-10 - an external scorecard set out what was missing before the 2025 statute: a twelve-area digital-trade assessment records no privacy law, no cybersecurity act and no artificial-intelligence framework, on data as at September 2024. The cut-off predates the data protection Act the ledger holds, so it reads as a dated baseline rather than a current position.	NO CHANGE
Ghana	A tier IV data centre hosting the customs system took information-security certification, and metrology modernisation aims at international recognition. 2026-02-24 - a new tier IV data centre in the second city hosting the integrated customs management system secured information-security certification, engineered for high availability, fault tolerance and business continuity on a near-zero-downtime migration. It is a certification of a facility hosting a government system rather than of the government's own estate. 2026-03-19 - the standards authority and a partner institute opened the second phase of a project aiming at a self-sustaining, internationally recognised national metrology institute. No count of international standards adopted nationally, and no conformity-assessment output, is published against either.	MOVEMENT
Guinea	An open government-stack standards workshop was held under the donor programme, with no standard adopted on the record. The workshop is the whole of the record on standards adoption (workshop). No conformance profile, building-block selection or compliance requirement has followed it, though the two interoperability platforms later presented to the prime minister are built in that programme's frame.	NO CHANGE
Guinea-Bissau	The meteorological institute operationalised the common alerting protocol, putting national alerts on search and mapping services. The operationalisation of May 2026 is the country's clearest adoption of an international data standard: the common alerting protocol, which is what makes a national weather warning appear inside general search and mapping services. The other adoptions are financial and regional rather than technical: the payment institution licensing regime of the monetary union and the regional biometric card specification.	MOVEMENT
Kenya	Cooperation with the European delegation was reaffirmed across artificial intelligence, cybersecurity, digital identity, interoperability and digital governance. The reaffirmation came at a principal-secretary-level meeting, and no agreement text, workplan, timetable or funding figure is published (meeting). It is the only standards-alignment engagement in the repository, and the country's own standards work — cloud accreditation classes, health interoperability guides, equipment licence conditions — is domestic and not framed against any international instrument on the record.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Lesotho	The standards institution is operational and the identity build runs on an international open-source standard. 2020-09-16 — the trade minister declared the standards institution operational, with a standards-development, testing and certification mandate. 2025-10-14 — a validation workshop aligned the data management policy with the African Union data policy framework. 2026-02-26 — the 2026 work plan continues deployment of an internationally developed open-source digital identity standard. No list of standards adopted, and no conformance regime, is published.	MOVEMENT
Liberia	ePhyto went live in April 2026, adding to the numbering plan's adoption of ITU-T recommendations. The National Numbering Plan of December 2023 adopts ITU-T Recommendation E.164 for national number structure and E.212 for mobile country and network codes, giving an international standard domestic legal effect through the regulator. In the window Liberia launched the IPPC and FAO ePhyto exchange on 20 April 2026 under the Regional ePhyto Africa Window, replacing paper phytosanitary certification with an internationally recognised digital certificate in support of the World Trade Organization trade facilitation agreement.	MOVEMENT
Libya	Operators were convened in April 2026 to begin the move from IPv4 to IPv6, with no timetable or target published. The communications authority convened operators on 22 April 2026 to start the transition (convening). No timetable, adoption target or measurement of current IPv6 traffic accompanies it, and the repository holds no other national programme to take up an international technical standard.	MOVEMENT
Madagascar	The largest mobile money platform is documented as conforming to the industry open interface standard, which is the only standards conformance on file. The platform was documented as conformant in a March 2025 case study of the industry body's mobile money interface and open platforms (case study). No national standards body, certification scheme or conformity register for digital systems is held, so the one standard the country demonstrably meets is a private-sector one adopted by a single operator.	NO CHANGE
Malawi	The registration bureau's plan embeds international digital-identity standards and the standards bureau's accreditation was renewed. The statutory route is the standards bureau, mandated to base national standards on international ones, whose own accreditation under the international conformity-assessment standards was renewed with effect from 14 December 2025. 2025-09 - the registration bureau launched a strategic plan for 2025 to 2030 embedding internationally aligned digital-identity and digital public infrastructure standards. 2025-10 - the data processor engagement regulations put the country's data-protection practice on a footing recognisable to an international counterparty. What the repository does not hold is any adoption list, gazette or conformance register naming which international standards are in force here.	MOVEMENT
Mali	Passport production restarted on 27 October 2025 to civil aviation standards, on a polycarbonate document with more than 50 security features. The clearest adoption of an international standard in the window is a travel document. The security ministry records the relaunch of production and issuance of the secure regional biometric passport on 27 October 2025 at the border police directorate, with a new domestic contractor; the document is polycarbonate, carries more than 50 security features invisible to the naked eye, and meets the requirements of the international civil aviation organisation, with start-up capacity of 450 to 500 passports per day per printer. It implements the harmonised regional specifications for travel and identity documents agreed in November 2024. Institutionally, the standards agency is an international standards body member.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritania	All licensed operators have activated IPv6, with one past 15 per cent of subscribers migrated against the strategy target of 25 per cent by the end of 2026. A sixty-eight page national transition strategy set a target of 25 per cent adoption by 2026 with a national transition committee (strategy); it carries no printed adoption date and its economic-impact figures are lifted from a consultancy report rather than measured (strategy). By July 2026 all licensed operators had activated IPv6 across networks and services, with one unnamed operator past 15 per cent of subscribers migrated (activation). The target is the clearest measurable commitment the country has made on a technical standard, and it is on course to be missed.	MOVEMENT
Mauritius	The postal operator is being wired into a global postal information-sharing centre with an international security standard urged, and the state operator co-chairs model-as-a-service certification work. The national postal operator is being connected to the postal union's global information-sharing centre and the minister urged adoption of the international information-security management standard; no membership date or commitment is published (postal). Work to define controls and conformance criteria for a model-as-a-service certification framework began in July 2026, with the state operator a founding contributor and co-chair; the framework does not yet exist, and the standards body's own research finds 72 per cent of operator leaders say they trust their production artificial intelligence while 14 per cent can evidence it (certification). The standards bureau's national certification scheme held ten valid ISO/IEC 27001:2022 certificates at 31 December 2025, among them the national response team, the revenue authority's server room, the civil service's central IT division, the police IT unit and two operators' data centres.	MOVEMENT
Morocco	The national information-security directive is structured on an international standard, and the new biometric passport carries a chip to the civil aviation standard. Circular 02/2023 put version 2.0 of the national information systems security directive in force, structured on ISO 27002, covering state bodies and all infrastructures of vital importance, with entities given six months to schedule conformity (directive). The passport decree approved in July 2026 specifies an encrypted chip to the International Civil Aviation Organization standard and four languages including Amazigh (decree, account). No conformity count, certification register or audit against either standard is held. Health is adopting clinical standards through testing rather than decree: the MOHIM lab profiles HL7 FHIR, DICOM and SNOMED CT for local uses such as the shared patient record and validates vendors on the Gazelle test suite (May 2026).	MOVEMENT
Mozambique	A free public device-identity lookup against the global device registry went live in August 2026, with no enforcement attached. The regulator opened public lookup against the industry association's global device registry on 4 August 2026 (notice, platform). It is verification only: no type approval, import control, blocking regime or penalty is attached, so a buyer can check a handset and the state cannot act on what the check shows.	MOVEMENT
Namibia	The regulator states it is the national root certification authority, and the interbank settlement system migrated to the international messaging standard. The regulator states it anchors the digital trust framework and regulates certificate and certification-service providers, a role the ministry had exercised in accrediting electronic-signature providers under the 2019 statute; that places the trust anchor inside the communications regulator rather than a separate cyber agency (authority, accreditation). The interbank settlement system has migrated to the ISO 20022 messaging standard (migration, pact). 2026-08 - the communications regulator and a German identity vendor signed an implementation agreement with the home affairs ministry to connect it to the national trust framework. 2026-10-04 - the regulator launched the framework's public-facing brand, DigiNam, on 31 August 2026.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Niger	Niger deposited its accession to the Marrakesh Treaty on 20 July 2026, in force for it from October 2026. The depositary's notification records the instrument of accession deposited on 20 July 2026 to the treaty facilitating access to published works for people who are blind, visually impaired or otherwise print-disabled, entering into force for Niger on 20 October 2026. The earlier instrument is the African Union cybersecurity and personal data convention, whose ratification the Council of Ministers authorised on 13 January 2022 and which was deposited that March. No national standards body's adoption of international technical standards for information systems is evidenced, and no conformity-assessment regime is on file.	MOVEMENT
Nigeria	Payments migrated to ISO 20022, crypto trades are reported to the international framework, the passport joined the aviation key directory, and a software assurance framework is proposed. The payments migration completed in 2025 with point-of-sale geo-tagging (migration), and crypto trade reporting against tax and identity numbers went live in January 2026 aligned to the international crypto-asset reporting framework (reporting). Integration with the civil aviation public key directory moved the passport from machine-readable to cryptographically verifiable at 111 member states' borders (passport). A national software quality assurance framework consolidates development, testing and licensing guidelines with an accessibility standard for citizen-facing platforms, tiers risk with core banking and national identity infrastructure in the top class, makes certification a condition of project clearance and sets full operation for 2027; it is not adopted and no licensed testing organisation is on file (framework); automated anti-money-laundering baseline standards were mandated in March 2026, shifting the test from tooling to governance, integration and explainability (baseline).	MOVEMENT
Rwanda	The capital hosted a technical assessment mission for cross-border data-exchange conformance in April 2026, as host and participant rather than as owner of the framework. The mission drove cross-border data interoperability under a continental alliance's exchange framework (mission). The framework itself belongs on the region's ledger rather than this one, so what the country has here is participation and a conformance assessment, not an adopted national standard. No conformance result is published.	MOVEMENT
Sao Tome and Principe	The country is a correspondent member of the international standards organisation, and the first bank certified to a quality management standard was recognised in August 2026. The membership record gives the category as correspondent member and names the national quality body as the member institution (membership). A bank became the first in the country to obtain the quality management certification, presented at a ceremony marking 55 years of its group and attended by members of the government, the central bank and the diplomatic corps (certification). A single private certification is the whole of the in-window adoption record; no public body is recorded as certified to any international standard.	MOVEMENT
Senegal	The standards association holds 789 national standards and is the national member body of the international standards organisation, with information technology a priority domain. The catalogue records 789 national standards elaborated and adopted, of which four sit in administration and commerce, four in organisational governance and nine are regional quality-management standards, with information and communication technology named priority domain 18. It names mirror committees to the international information-technology, electronic-commerce transaction assurance and organisational-governance committees, and states that regionally coded standards are adopted as new national standards or replace existing ones under a regional harmonisation regulation. Two limits carry from the document: its cover is dated 2025 while its foreword calls itself the 2023 edition, and no information-security management homologation appears in the captured portion.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Seychelles	Seychelles moved all domestic and cross-border electronic payments to ISO 20022 from 22 November 2025, replacing SWIFT MT formats. The central bank and the bankers' association jointly notified the adoption of the ISO 20022 messaging standard for all domestic and cross-border electronic payments, replacing SWIFT MT formats, with effect from 22 November 2025 (notice). In the standards infrastructure proper, the Bureau of Standards gained externally accredited mass-calibration capability in September 2025 (accreditation). No completion statement or migration report after the November effective date is held, so the adoption is dated by its deadline rather than by its delivery.	MOVEMENT
Sierra Leone	The Standards Bureau holds 204 national and 156 regional standards, mostly adopted from international bodies, and began enforcing new iron rod standards in November 2025. The bureau's own overview records 204 national and 156 regional standards, most of them adopted rather than originated (overview). The trade ministry warned importers in November 2025 to meet new iron rod standards (enforcement). No digital, data or interoperability standard appears in the adopted set as published, and no conformity assessment figures are held.	MOVEMENT
Somalia	The cybersecurity risk and compliance frameworks were published in July 2026, and the bureau of standards is the country's member body at the international standards organisation. The regulator published a National Cybersecurity Risk Management Framework and a National Cybersecurity Compliance Framework with download links in July 2026, reported as aligned to the international information-security management and risk standards (publication). The national bureau of standards holds member-body status, participating and observing on technical committees and observing on a policy committee (registry). A government information-systems audit cooperation programme sits alongside both (programme).	MOVEMENT
South Africa	The 2026 National Radio Frequency Plan re-bases the allocation table on the ITU Radio Regulations 2024 and aligns to the continental and regional plans. 2026-07-24 — the National Radio Frequency Plan 2026 was gazetted, approved by the minister on 2 July. It re-bases the 8.3 kHz to 3,000 GHz allocation table on the ITU Radio Regulations 2024, keeps the country in ITU Region 1 with national variations only under the treaty's own reservation article, and aligns to the African and Southern African allocation plans. This is standards adoption in its plainest form: the national table now says what the international one says. 2026-08-03 — a second, quieter adoption. The medicines regulator invited clinical-trial sponsors to report serious adverse events through the World Health Organization monitoring centre's module, routing domestic trial safety data through internationally hosted infrastructure and taking its reporting standard rather than writing one. No pilot duration, participant target, data-residency statement or transition date to mandatory reporting is published.	MOVEMENT
South Sudan	The regulator committed to the Common Alerting Protocol in May 2026, under a regulation that already lets it recognise foreign approvals. The 2016 type approval regulation, made under the National Communications Act 2012, establishes type approval and acceptance and expressly permits the regulator to recognise foreign national regulatory authorities' standards and equipment approvals (regulation). As the country's focal point for the international telecommunications union's early warning pillar, the regulator held a national workshop and committed to adopting the Common Alerting Protocol for standardised multi-channel alerts, backed by a planned US$2.8 million emergency operations centre investment (commitment). Recognising others' approvals is cheaper than writing standards, and it is what this repository shows the country doing.	MOVEMENT
Sudan	A banking cybersecurity framework made ISO and PCI alignment mandatory, and Sudan deposited its passport signing certificate in the ICAO directory. The central bank's framework, issued in January 2026 over the governor's signature, requires banks and financial institutions to align with ISO 27001, ISO 27002, NIST, ISF, Basel and PCI DSS (framework). It is a mandatory instrument, not an aspiration. On 15 February 2026 Sudan deposited its country signing certificate in the International Civil Aviation Organization's public key directory in Montreal, enabling worldwide verification of its machine-readable passports (deposit). The USSD circular separately requires encryption to TLS 1.2 and ISO/IEC 27001 (circular).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tanzania	More than 130 standards are compulsory, and the central bank issued sustainability and climate-risk guidelines for 2025. The accountancy board's 2018 pronouncement assigns full international financial reporting standards, public-sector accounting standards and the small-entity variants by entity category, effective for periods from April 2019. The standards bureau's October 2025 compulsory list carries more than 130 mandatory standards enforceable under the standards statute, including identical or closely referenced international electrotechnical adoptions. The central bank's supervision report for 2025 confirms new guidelines on sustainability-related and climate-related financial risk aligned to the international sustainability standards, alongside continued Basel implementation. None of the adopted standards on this record is digital or information-security specific.	MOVEMENT
Togo	The national standards body is a full member of the international standards organisation, and published 46 national standards in August 2026. The registry entry records the Agence togolaise de normalisation as Togo's national standards body with full member body status, participating as an observing member on technical and policy development committees. Under the food-system resilience programme the agency drew up 46 national standards and the accreditation committee 31 certification programmes, disseminated at Lome on 17 and 18 August 2026 and at Kara on 20 and 21 August, for market access under the continental free-trade area. The ministry says the standards were drawn up and disseminated, not homologated, and names no international or regional source texts behind them.	MOVEMENT
Tunisia	A public enquiry opened in May 2026 on draft national standards transposing international measurement and cable standards. The standardisation institute opened public enquiry 441 from 25 May to 24 July 2026 on draft national standards transposing the international measurement-management, accuracy and precision, and uncertainty-of-measurement series together with cable standards, under the 2009 standardisation law and its implementing decree. Transposition of measurement and electrical standards is what the record shows. No adoption of an international standard bearing on digital systems — information security management, interoperability, data quality, accessibility — appears anywhere in this repository. The national frequency agency hosted the third African preparatory meeting for the 2027 World Radiocommunication Conference in Tunis in September 2026, coordinated by the African Telecommunications Union; no adopted position is published.	MOVEMENT
Uganda	The procurement authority was certified to ISO/IEC 27001:2022 in June 2026, the first of the selected institutions, and two international AI standards are working drafts. 2026-01 - the standards body's January-June 2026 work plan, notified to the World Trade Organization, carries two international artificial-intelligence standards as working draft Uganda standards, on machine-learning system frameworks and on concepts and terminology, with a council approval target of June 2026. Neither is recorded as adopted, and that target date had passed by the close of this window. 2026-06 - the public procurement authority was certified to ISO/IEC 27001:2022, the first of the government institutions selected under the digital acceleration project to reach certification; the ministry states ISO/IEC 42001 is expected to guide artificial-intelligence governance next. 2026-07 - the updated national information security framework is written to the ISO/IEC 27000 family, its policy carrying a version history running from a 2014 initial draft to an enhanced draft of September 2025. How many institutions remain uncertified is not stated in what is held, so the denominator behind the first certification is unknown.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zambia	The standards bureau states more than 50 international standards adopted within a catalogue of over 6,500, and an extractives validation scored 81 points. The standards bureau states that more than 50 international standards have been adopted as Zambian Standards, within a catalogue of more than 6,500 national standards across sectors including information and communication technology. The page is undated, so the figures are dated to retrieval. 2026-06-25 — the extractives transparency board found the country's fourth validation under the 2023 standard achieved a very good overall score of 81 points, an international standard applied and independently assessed here rather than merely adopted. Adoption counts and an assessed score are different kinds of evidence; the second is the rarer and it is not about digital.	MOVEMENT
Zimbabwe	The standards catalogue carries ZWS adoptions of ISO and IEC standards, and the information-security certification scheme was accredited regionally in February 2026. The national standards body's catalogue, updated to March 2025, carries dedicated sections for ZWS adoptions of ISO and of IEC standards, covering information security, software and cloud computing (catalogue). Its ZWS ISO/IEC 27001:2022 information-security certification scheme is accredited by the Southern African Development Community Accreditation Services, alongside quality, environmental, occupational-health and food-safety schemes (accreditation). A financial group announced on 10 June 2026 that its banking, insurance and securities subsidiaries had attained ISO/IEC 27001:2022 certification, the repository's one dated instance of a Zimbabwean institution certified against the adopted standard (certification). No count of certified organisations is published.	MOVEMENT
