PROGRESS REPORT

Data Storage: progress report, October 2025 – October 2026

Edition of 2026-10-12 · compiled by Claude Opus from the documents in the Corpus repository

> *54 countries. Each row below is carried verbatim from that country's own progress report, which answers a fixed frame of indicators over the period; nothing is written here. A country not listed under an indicator has* **No evidence** *on it in its own report.*

LOCAL DATA CENTRE CAPACITY (ALL PROVIDERS) · LOCAL DATA CENTRE CAPACITY (NATIONAL PROVIDERS) · OFF-SITE BACKUP CAPACITY

Progress values. *Movement* — some form of progress, however minor, has been recorded. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the repository holds a standing position and nothing in the period touched it. *No evidence* — the repository holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Movement, regulations still pending*.

The place reports do not share one window; the period above is the range they span.

Local data centre capacity (all providers)

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	A private firm was granted land at El Affroun for a data centre in September 2026, and a provider running two sites offered 20% of its capital in June. 2026-09-02 - the investment agency awarded a private e-commerce firm a land concession at El Affroun, Blida, for a data centre, with 340 jobs projected; no investment amount, capacity or timetable is stated. The research centre's cloud platform was launched in March 2025 on open-source cloud and container technology, with an incubator attached targeting 100 startups a year from 2027, and nothing revises it. A private provider has run a Tier II-ready data centre certified by the regulator since June 2020, with a cloud platform for companies and agencies. A second provider published the specification of a 120 m² colocation site at Oran with two 100 kVA generators in 2021. A third, running two data centres, offered 20% of its capital on the Algiers stock exchange in June 2026 to raise 1bn DA, mostly for 294 servers (prospectus); the outcome of the offer is not held. No tenancy or utilisation figure is published for any commercial facility.	MOVEMENT
Angola	A commercial data centre opened at up to 3 MW over more than 800 racks, while the only Tier IV project has produced nothing since 2023. 2025-10-02 — the country's first Tier III commercial facility opened at up to 3 MW and more than 800 racks over 19,000 square metres on US$30m, near the cable landings, with a plan to exceed 7 MW within five years. Its operator contracted six times as much power across its group in the first half of 2026 as a year earlier. Against it, a second commercial project announced in 2023 as the country's first Tier IV facility at over 10 MW and 2,000 racks, financed but not built, has no source since and never had a stated completion date. Three years of silence on the only Tier IV project in the country is the counterweight to one facility opening.	MIXED a Tier III commercial facility in service while the only Tier IV project has been silent for three years

COUNTRY	DEVELOPMENTS	PROGRESS
Benin	The national data centre is in service and a privately financed carrier-neutral facility signed definitive agreements. No rack or megawatt figure is published. The national data centre at Abomey-Calavi was under commissioning with tier certification in progress, secured power and dual fibre. 2025-08-07 — definitive agreements were signed for a Tier III-ready, carrier-neutral data facility in Parakou paired with a 10 MW solar plant, commissioning still ahead. 2026-03-10 — a regional digital integration operation was approved that funds this layer. One state facility in service and one private facility financed is the position; neither publishes capacity. An internet provider opened a neutral data centre to large-account customers in 2015, and a mobile operator launched a data-centre service on 14 June 2019, still offered in 2023. Neither publishes capacity.	MOVEMENT
Botswana	A gas-powered private data centre completed its first full quarter of continuous operation, and a solar campus aimed at hyperscale compute remains a memorandum. 2026-08-03 — a private data centre reached its first full quarter of continuous operation for the quarter ended 30 June 2026, fully commissioned, with revenue the company describes as modest and at proof-of-concept scale, designed for up to 1MW with expansion subject to funding, against a first module under commissioning with generators en route and no revenue in September 2025. 2025-10-02 — a solar-powered campus targeted at hyperscale and artificial-intelligence compute is at memorandum stage inside a planned energy hub and industrial park, reported as a Dutch and American venture, with no capacity, cost, site approval or timeline and nothing on file since. 2023-12 - a mobile operator opened a US$5.2m Tier III facility at the state innovation hub in Gaborone, publishing no specifications; nothing later is held on it. 2026-10-05 - the gas supplier's annual report said the centre ran materially below its design capacity in the year to June 2026 for lack of gas.	MOVEMENT
Burkina Faso	A domestic commercial hosting provider launched in July 2026 with more than 600 domain names and more than 196 web hostings, beside one internet provider's own Tier III data centre. 2026-07-31 — a commercial hosting provider launched under ministry patronage, operating with more than 600 domain names, more than 196 web hostings and 98% availability at launch, offering services from domain registration through virtual and dedicated servers to colocation, framed as a digital sovereignty asset. Before it, the commercial facilities on record were a Tier III data centre run by a Ouagadougou internet provider operating since 2016, a tier the operator states and no certificate confirms, and an operator data centre at Balkuy, solarised in 2024. Capacity, tier, certification and continuity are unstated, and the wholly-local claim is unverified. It matters because the localisation doctrine reported under policy obliges public bodies to host nationally, and the private capacity on record to meet it is three providers, none with a published capacity.	MOVEMENT
Burundi	No shared government data centre exists and capacity is being added one agency at a time, a development agency tendering for its own racks. A country diagnostic records that no shared government data centre exists, that the revenue office, the central bank and the presidency each run their own, that the backbone company hosts a national data centre other public agencies use for backup, that it operates one level-3 data centre built for USD 2 million, and that there are only about four data centres of decent grade in the country. 2026-02 — a development agency published a full national open tender for data centre racks, stabilisers and projectors with technical specifications and quantities. It is concrete in-window procurement of physical capacity, and it is for one agency's own facility rather than for a national one — which is the pattern the diagnostic described six years earlier and nothing since has changed.	MOVEMENT agency by agency

COUNTRY	DEVELOPMENTS	PROGRESS
Cameroon	A United States company stated an intention to invest US$75m in an artificial-intelligence data centre and power plant at Douala, where a carrier-neutral facility operates. The intention was announced on 27 August 2026 at the inaugural bilateral economic and commercial dialogue, as one project among an estimated US$7bn of investment and trade opportunities floated there (announcement). No agreement, site, capacity, financing arrangement or date is on record. 2026-09-07 - the announced Douala project was confirmed and qualified in the same week. The vendor confirmed US$75m, about FCFA 42.25bn, for a data centre designed in part for artificial-intelligence workloads with dedicated power generation, while the planning ministry described it as an intention presented at the first bilateral economic forum rather than a commitment. The same vendor's Cote d'Ivoire project was underwritten by a US$66.14m export-credit guarantee; nothing of that kind is published here. A carrier-neutral facility is operating in Douala: ST Digital's DLA01, billed as the first carrier-neutral Tier III site in Central Africa and certified to the OIX-2 interconnection standard in September 2024. The tier is the operator's; no capacity or tenant figure is held. An operator data centre of about 1,000 square metres was inaugurated in Douala on 31 May 2017, billed at the time as carrier-neutral; no later account of it is held.	NO CHANGE a first position with no earlier figure behind it
Cape Verde	The state data centre at Achada Grande was designated critical infrastructure in September 2015; no rack, floor area, power or server figure is published for it or for any other provider. The designating act records that the centre had recently been inaugurated as a purpose-built high-standard facility housing processing and storage equipment, principally the State's, with the potential to serve banks, companies and other national and international entities, and that the state technology operator requested the classification. It establishes that the facility exists and is state-held, and publishes no capacity figure of any kind. A third data centre is to be installed in Praia, with the technology park in prospect of handing it to private management (interview). No capacity figure has been published since: the operator has published no accounts after the 2024 volume, so no later certification, capacity or utilisation statement is held, and no Cabo Verdean source publishes a national data-centre capacity inventory.	NO CHANGE a standing position the repository holds for the first time
Central African Republic	No operating data centre. A tier-three facility is planned with a vendor and a 2025 commercial memorandum is dormant. The country has no data centre in operation on this repository. Two are proposed. The state's is a tier-three facility to be built with a vendor as part of an electronic government modernisation programme, still planned; the commercial one is a memorandum signed in January 2025 and recorded as dormant. A third route is regional: the continental infrastructure programme's regional data-centre work through the central African community, in development. Meanwhile the government secure interconnection network is also planned. No rack, floor-area or power figure exists to report.	NO CHANGE
Chad	The national data centre is built and awaiting audit and certification, an eighteen-month slip on a January 2025 statement that inauguration was forthcoming. Building and operational equipment are confirmed complete with audit and certification the last step before inauguration; the facility is four storeys at the capital, measured at about 500 square metres per level and about 2,000 in total by two accounts (centre, audit, finalisation, sovereignty). One hundred government micro data centres are provided for as a clause of the audit agreement rather than as a project with its own instrument (micro centres). The one commercial facility on record is a prefabricated 374 m² data centre with 400 kW of IT load, built for the operator Tigo and inaugurated in N'Djamena on 21 June 2016 (build); no later record of its operation is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Comoros	A Tier 3 public administration data centre was inaugurated on 19 May 2025, co-managed by the digital agency and the cable operator. 2025-05 - the government had decided in 2024 to bring the public administration data centre back into service, and the inauguration was announced for 19 May 2025, a Tier 3 facility co-managed by the national digital development agency and the cable operator, intended to reduce dependence on foreign infrastructure, cut costs, improve interoperability between public services and pool computing resources. It sits under the national digital strategy to 2028, whose execution is costed at 21 billion Comorian francs, about US$47.8m, 59 per cent public, 5 per cent private and 36 per cent in public-private partnership. The one capacity figure given is stated in terabytes of hosting, which is not a measure of a data centre's size, and no tenant, utilisation or uptime figure is published. No commercial data centre capacity appears in this repository at all.	MOVEMENT
Congo	A feasibility study opened on a regional data centre attached to a gas plant, and a sovereign hosting programme was named. 2026-06 - a centre of excellence and a non-governmental body signed a protocol opening a feasibility study on a regional data centre attached to a gas plant, framed as an energy and digital nexus, with experts assessing the site's energy potential. No cost, timetable, capacity or financier is named: a study, not a build. 2026-07-28 - a published roadmap named sovereign hosting and connectivity infrastructure at the two highest tiers as one of nine structuring programmes, with no budget, site or date attached and no published national data-centre programme distinct from the regional backbone build. Two operating facilities are on the record beside these: the regulator's own data centre, inaugurated in August 2021, and a pan-African Tier 3 operator that lists Congo among its seven countries and was certified ISO 27001 in March 2026, with no Congolese site named.	MOVEMENT
Cote d'Ivoire	A new data centre was inaugurated at the technology park in October 2025, while a GPU hosting platform did not appear. 2025-10-02 - a data centre was inaugurated by ST Digital at the technology park to host firms' and institutions' data on national territory, billed ahead of opening as the country's first sovereign Tier III facility; no IT load, floor area or customer figure is stated. The carrier-neutral facility operating since September 2024 is still at a design capacity of about 400 racks and 1.5 MW of IT power, with group committed capital up to US$380m in July 2026, a group figure rather than an Ivorian one. A GPU hosting platform announced in February 2025 for service from that year's second quarter has no launch, capacity, pricing or customer on file. Older facilities held: an operator group centre at Grand-Bassam built in 2016 at 1.3MW, a colocation site beside the Abidjan cable landing from December 2019, MTN colocation at four sites, the first opened in 2014, an Orange centre at Yamoussoukro on solar supply from 2023, a modular Tier 3 park at the technology zone and a data centre donated to the zone in 2011. A local sovereign cloud offer launched in November 2024, and a Dutch fund is paying for a feasibility study for a further colocation centre.	MIXED a new data centre was inaugurated while a sovereign GPU hosting platform passed its stated start with nothing on record
Djibouti	The Tier III facility and cable landing station inaugurated in November 2024 is in service; a second joint venture lost its partner when the sovereign fund was dissolved. The facility was inaugurated on 25 November 2024 and is in service, unchanged through the window, with no capacity, utilisation or tenant figure published. A data centre joint venture between an operator and the sovereign fund was announced with no construction on record, and its stated first phase of 2026 is unverified; the 50,000 square feet, 5 MW and US$50m figures are the parties' own. In April 2025 the operator said the project was at design stage with first phases 12 to 18 months away; the same month the sovereign fund was dissolved by decree and a liquidator named. No successor to the fund's stake and no construction are on record. 2026-09-14 — a diagnostic put data centres among three sectors carrying at least US$600m of private investment and about 12,000 jobs over five years. Nothing is committed.	REGRESSED a planned joint venture lost its sovereign-fund partner

COUNTRY	DEVELOPMENTS	PROGRESS
DR Congo	The largest facility is unchanged at 400 racks and 1.5 MW, and a university data centre with high-performance computing opened in Lubumbashi on 27 June 2026. The facility has operated since August 2024 as the country's largest, Tier III certified, at 400 racks over 1,542 square metres and 1.5 MW, on US$30m invested. No utilisation, capacity-sold or expansion figure is held, and its position did not move in the window. What moved is its parent's balance sheet: committed capital rose from US$350m to US$380m, with six times as much power contracted in the first half of 2026 as a year earlier. That is group-level across six live markets and none of it is allocated to this country in the source, so it says nothing about capacity here. 2026-06-27 - a private university inaugurated a data centre of about thirty servers with high-performance computing on its Lubumbashi campus, for research, artificial-intelligence and industrial data. No power or cost figure is published.	MOVEMENT
Egypt	Ten data-centre licences were issued over two years, and the government's AI data-centre build is contested between a Chinese vendor's bid and a United States consortium with no award on file. Standing commercial sites predate the window: a 5 MW carrier-neutral facility in New Cairo opened in 2015, with an EGP 2.7bn expansion adding 12 MW announced in 2023; the new capital's data centre, built on over US$135m, was providing colocation by 2024; and a Cairo operator took US$25m for a third Tier III site, selling a 42.9% stake. Two 2023 Gulf ventures, a 25 MW hyperscale site at Maadi and a 192 MW three-campus memorandum, have no construction on file. Also held: the incumbent's six commercial data centres beside its regional hub campus, an operator business cloud opened with an Alexandria data centre in 2020 and extended to Huawei Cloud in 2024, and two banks' own Tier III centres, one certified as built in 2024 and one opened in 2022. One campus is reported at 25 MW operating with plans for 45 MW. 2026-09-23 - an 80 MW Sokhna site had USD 270 million allocated to phase one of USD 1.2 billion, undated. 2026-10-07 - an investment company's chief executive put installed data-centre IT load at about 15 to 20 MW, against 400 to 500 MW announced, of which about 20 MW is committed.	MOVEMENT
Equatorial Guinea	A digital economic zone at the new capital is under evaluation around artificial intelligence, big data and high-performance data centres. No instrument, site or investment figure is published (zone). No commercial data centre exists anywhere in the repository, so the whole of the private-capacity record is a zone under evaluation and a data centre bundled into a subsea cable agreement with Nigeria.	MOVEMENT
Eritrea	One provider, and it is the state operator. Its private cloud is hosted entirely in its own data centres; no other facility is named on the repository. The repository now holds primary evidence that domestic hosting capacity exists, which it did not before. The state operator's private cloud service is offered in three subscription tiers and hosted entirely in the operator's own facilities. What it does not hold is any measure of that capacity. No aggregate figure, facility count, floor area, power draw or location is published for the country by anyone, and no second provider appears anywhere. A long-form policy piece argues that critical state information and nationally important services should be capable of being hosted domestically, which is an argument rather than a measure.	NO CHANGE
Eswatini	A government assessment finds ministries depend heavily on the National Data Centre with no internal fallback. The assessment finding is that dependence is heavy and internal fallback absent (assessment, centre). No capacity or tenancy figure is published for the facility itself; its operator describes it as Tier III at 99.982% uptime, with a hot recovery site planned about 50 km away, in an undated brochure. 2026-09-22 — the finance minister told Parliament that the science-park facility does not constitute a fully operational data centre, on the information available to government.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Ethiopia	Commercial facilities at the Addis Ababa technology park include a Tier III-certified 800-rack site opened in 2023 and a modular facility opened in 2022, with no national capacity figure on the record. 2021-03 - a private operator broke ground on its first facility at the technology park, with a German supplier contracted for a modular build; its modular data centre opened in September 2022, the operator putting it and its headquarters at US$130m. 2022-01 - the second mobile operator's first data centre, prefabricated in China and put at US$100m, was delivered to Addis Ababa. 2022-09 - the same operator signed a land sub-lease at the same park for a Tier III telco-cloud data centre, its third in the country, reported at about US$60m; no construction or opening is on record. 2023-11 - a pan-African operator opened a Tier III-certified facility at the park with room for 800 racks and up to 3MW of IT power, two years after its original target. 2024-07 - a domestic public cloud billed in birr launched, hosted with the same operator. 2025-06 - a regional operator's Tier III-certified campus in the country houses the Addis Ababa exchange. A July 2026 survey names Ethiopia among six markets diversifying an estate in which South Africa holds more than 60% of operational capacity (capacity survey). No megawatt total, facility count or utilisation figure for the country is published.	NO CHANGE facilities opened before the window with no newer capacity figure
Gabon	92 racks and 1 MW entered service in July 2026, against about 95 per cent of national data previously hosted abroad. The country had no data centre in service before July 2026; 92 racks and 1 MW went live on 3 July, with a further 160 racks and over 1 MW due end-November to early-December 2026 (capacity, second facility). About 95 per cent of data produced in the country is hosted outside it, reported by the operator that built the alternative, with no independent measurement held (hosting share). Utilisation is published at neither site.	MOVEMENT
Gambia	The first private data centre entered service in April 2026, on a base that had held no data centre of any kind. It was built by a domestic group with its mobile operator, a 17-year Huawei partner (inauguration). With the state facility opened two months later, the country went from no data centre to two in a single quarter, and no capacity, occupancy or price figure is published for either. 2026-04-29 - the first private facility was inaugurated and announced by the State House, the operator claiming it as the country's first. No capacity, occupancy or certification figure accompanies the claim.	MOVEMENT
Ghana	About 4.8 MW of live critical load across 8 to 10 commercial facilities in 2024, against a campus with 30 MW committed and expansion designed to 150 MW. The 2024 estimate carries 7 MW in construction, about 60 per cent occupancy and about US$12m of annual revenue, an analyst's modelled figure for a European investment facility (market brief). The largest committed campus, 30 MW designed for 150 MW, is known only from a regional trade round-up (campus). A carrier-neutral facility at a subsea landing was commissioned in late 2025 at up to 1.7 MW and 500 racks (commissioning, opening). A facility announced in 2023 at 10 MW expandable to 30 MW (announced facility) was restated at 30 MW in June 2024 with a local build partner; at the end of 2024 the developer blamed its own refinancing for a delay and gave no completion date. Operating sites include a 12 MW Tier IV facility opened in June 2022, the only Uptime-certified Tier IV site in the country, and a colocation site expanded to 1.2 MW in 2024; a 100-rack Tier III build near Accra, due in late 2020, opened in June 2021. An operator's two Accra switching and data centres were certified Rated-3 as constructed in March 2022, and both certificates expired in March 2025 with no renewal on file.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea	The national data centre entered service in September 2025 and a commercial colocation facility of 228.91 square metres has operated at Kipe. No national capacity total is published. 2025-09-04 - the presidency's account of the inauguration states that strategic state data had previously been hosted abroad at about USD 5 million a year and that the new infrastructure returns control of that data to the country, placing the step in the third pillar of the national vision. No floor area, rack, power or tier figure appears in the official account. The commercial position is documented in more detail than the state one: 228.91 square metres across three rooms, the meet-me room and colocation room linked by two 96-strand fibre cables, with three power sources including two 400 kVA generators and battery banks with 72 hours autonomy, precision cooling in redundant mode and gas fire suppression — and no tier rating or rack count. 2026-07-15 - the minister received a delegation on bringing the national data centre into operation and developing a technology park, and ordered a technical committee to examine the technical, organisational and operational aspects. An execution milestone, not a contract award.	MOVEMENT
Guinea-Bissau	A data centre appears as a named line in the 2026 budget; no facility or capacity figure is published. No Guinean data centre capacity figure exists in the repository, from any provider. What exists is intention with money attached: the 2026 budget's digital transformation line covers a data centre alongside the financial system, communications and an enterprise system, and the cybersecurity feasibility study scopes a national cloud.	MOVEMENT
Kenya	A 6.4MW build opened at Karen in September 2026 on a campus now above 14MW, while a 44MW build slipped to July 2027 and a 100MW geothermal project stalled on commercial terms. The 44MW build runs in two phases at US$150m with a dedicated 135 MVA substation and on-site solar, now deferred to July 2027; anchor-tenant talks with four hyperscalers rest on the operator's word alone. 2026-09-08 - the September opening reaches the repository with its campus figures: 6.4MW added at Karen, a master-planned campus above 34,000 square metres and more than 14MW of total IT power, and NBO2 itself up to 4,000 square metres across six data halls, certified LEED Silver, alongside the retirement of the local brand. 2026-09-10 - the proposed US$1.5bn offshore facility took a step: a US energy-equipment company is to supply gas turbines for the power barge feeding it. No capacity, grid arrangement or construction start is disclosed. The regulator's standalone data-centre licence is out for 30 days' comment. Older facilities on file include a carrier-neutral site at Nyali, Mombasa, with a 3.9MVA feed, its 900kW neighbour open since 2017, a colocation site at Upper Hill, a Nairobi site certified Tier III for design in 2017, and an operator's Limuru build, whose first phase finished in March 2025 towards 2.8MW.	MIXED one campus opened and another is financed while the two largest announced projects have stalled or slipped
Lesotho	Project Kobong was approved in July 2026 as a green-powered artificial-intelligence data centre at Mokhotlong, with construction targeted for 2029. The project was approved and launched at a ceremony hosted by the United States Embassy on 31 July 2026, on a binding memorandum covering pumped storage and a data centre at Mokhotlong, conditional on feasibility, financing, permitting and definitive agreements (approval, partnership). Construction is targeted for 2029 (account, first data centre). The repository holds no operating commercial data-centre capacity in the country at all, so the whole of this indicator is a project not due to break ground for three years. 2026-09-15 — the largest foreign investment the country has recorded is a data centre: a US$6.2bn hydropower and AI data centre agreement was signed, with a minister holding shares in a named potential local partner. A feasibility study comes first.	MOVEMENT
Liberia	The only published Liberian capacity figures are the cable landing station's own rack specifications. The consortium's colocation page offers climate-controlled racks at 2 to 10U at 1kW with a 2kW maximum, 24U at 3kW and 42U at 5kW at the Monrovia landing facility, with uninterruptible and generator power, air conditioning, fire suppression and cross-connect support. These are offered configurations, not installed or occupied capacity, and no other Liberian facility owner publishes its own figures. What is being added is visible only through procurement: a June 2026 tender for eight application servers, four database servers and two storage arrays for the National Single Window.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Libya	Almadar Aljadid's Tripoli and Benghazi facilities and a Tripoli cloud and colocation provider are the capacity on file; a 2019 Tripoli project has nothing since. Root-server instances entered service in October 2025 in Almadar Aljadid data centres in Tripoli and Benghazi, the first evidence on the repository that a national operator runs data-centre space (root servers). A Trans-Sahara and Tatweer data centre was announced for Tripoli in October 2019 for delivery in early 2020, and nothing on it has appeared since (announcement). No floor area, tier rating or customer figure is held for any facility in the country. A Tripoli provider sells OpenStack infrastructure-as-a-service from 1,780 dinars a month for 16 virtual CPUs, with colocation and object storage, and claims PCI DSS 4.0 Level 1 compliance. The state carrier has since 2021 sold private links to Microsoft's data centres abroad, which serves hosting outside the country rather than in it. A hosting company opened a Tripoli data centre in April 2024 behind a local OpenStack cloud, and a free zone launched a fourteen-rack hosting centre for its investors in February 2023.	NO CHANGE
Madagascar	A commercial capacity estimate for 2024 is the only figure held; government capacity was tendered in February 2026. A market briefing gives a country-level commercial data-centre capacity estimate as at 2024, the only such figure located (briefing). Infrastructure equipment for the two government data centres was tendered in three lots in February 2026 (tender), after an air-conditioning quotation for the secondary site in August 2025 (quotation). An Antananarivo provider sells colocation in two carrier-neutral data centres it describes as Tier III ready, a description no certificate on file confirms. No regulator return, no operator-by-operator inventory and no commissioning date for the state facilities is held. The commercial figure is a market brief, not a supervised return.	MOVEMENT
Malawi	A commercial data centre opened in Lilongwe in 2026 and an operator third facility passed its stated build window, against 3 per cent of content served locally. The commercial facility is in operation offering local hosting, positioned against the foreign-currency cost and data-ownership exposure of offshore hosting; capacity, tier and pricing are not stated and the account is company-reported (facility). An operator announced a third data centre for construction within three months in March 2026; that period ended in June and the repository holds no record of a start, a site or a completion (third centre). A byte-weighted measurement puts 3 per cent of web content served locally and 62 per cent regionally, primarily from South Africa, the lowest local share among the economies in the study (locality), a single measurement on a methodology the publisher describes as under development. 2026-09-10 - the second operator bought an existing Tier III facility at Kanengo for K12bn instead of building the third data centre it announced. 2013-12-03 - an operator opened a data centre in Blantyre on over US$1m, doubling its own capacity and promising cloud services; nothing later is held on it. 2026-02 - an internet provider brought an AI-enabled edge data centre live in Lilongwe, now being retrofitted for inference, with three more planned for Blantyre, Mzuzu and Zomba, on its chief executive's own account.	MIXED a first commercial facility in operation while only 3 per cent of web content is served from inside the country
Mali	One facility: a tier-three centre inaugurated on 31 January 2026 with a stated availability standard of 99.982 per cent. No commercial provider is named. The window converted an absence into a facility. The centre was inaugurated in Bamako on 31 January 2026, intended to host electronic government platforms and the state's strategic databases, with a stated availability standard of 99.982 per cent. What is not published is its size: no rack count, floor area, power draw or customer is stated, and no commercial or operator-run data centre appears anywhere on the repository for Mali. National capacity and this one building are, on the evidence held, the same thing.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritania	The Nouakchott data centre runs to 1,372 m2 and 100 server racks, and the national cloud was inaugurated on it in June 2026. The facility was inaugurated by the President on 8 May 2025 as the first national installation of its kind, presented as certified to international standards and stated as extensible (inauguration). The national cloud was inaugurated at it on 29 June 2026, the minister telling parliament three days later that its launch removes the need to host state services internationally (cloud, statement). The financier states Tier III certification by the Uptime Institute and operation by International Mauritania Telecom (financier); no certificate is published, and utilisation, customers and load are unpublished. A backup data centre was specified under the earlier connectivity programme and nothing says whether it was built (specification).	MOVEMENT
Mauritius	Ten facilities operate across five locations, unchanged in count for a year, and a carrier-neutral green data centre was announced at a regional summit in August 2026. The estate is ten operating data centres across five towns, including a carrier-neutral facility designed to the highest resilience tier and the internet exchange point; no new facility has been reported since (estate). A carrier-neutral green data centre and a digital embassy village were announced at a regional summit in August 2026 as the digital leg of a bid to position the country as a regional hub, with no site, capacity, cost, operator or date stated (announcement). A commercial estimate puts installed capacity at 5 MW in 2025 and on course for 11 MW by 2030, with one cybercity holding about half the market (market report). It is a vendor figure, and no official measure of installed capacity is held. 2020-09-24 - an operator's Arsenal facility was certified Rated 3 as a constructed facility, a certificate the register shows expired on 23 September 2023.	MOVEMENT
Morocco	There is no national facility count with an established counting rule; the state last measured 98 MW for 2020, and a hyperscaler cloud region opened at Casablanca in April 2026. The widely repeated count of twenty-three is a September 2023 tally of facilities certified by one institute, not a census; other published counts use unstated rules (monograph, comparison). The economic and social council's series ends at 98 MW installed in 2020, of which 14 MW was outsourced, against 52 MW in 2014 (series). 2026-04-07 - Oracle's Casablanca public cloud region entered service in N+One's facilities, with a second region at Settat undated. Other facilities are known one by one: a 1.5 MW Nouaceur site of 2025, a Tier III joint-venture site, an AWS edge zone, a Temara site of 2017, merged into a new company in 2025, N+One's sites at 8 MW, inwi's Technopolis site and its two sovereign cloud platforms of 2023, Maroc Telecom's Casablanca enterprise site of 2017, a university's 5 MW Benguerir facility and a Kenitra-region site its owner describes as in service. Unbuilt on the record: an OVHcloud edge zone with no deployment date and a 386 MW Tetouan project due by mid-2026, still listed as announced in January 2026.	MIXED facilities opening one by one against a national capacity figure six years old and no reliable estate count
Mozambique	The national count stands at seventeen or eighteen on one 2025 speech, above a 400-rack Tier III facility and a US$25m operator centre. The only national count is a figure given by the Prime Minister in March 2025, which two accounts of the same sentence report as seventeen and as eighteen; nothing later has been published and the university facility and two announced availability zones appear in no national count (count, account). The independent carrier-neutral facility at Beluluane is Tier III certified with 400 racks, 2,000 square metres of white space and 3 MW of information technology power, indirect adiabatic cooling at a stated power usage effectiveness of 1.3, and eight connectivity providers terminating fibre into two meet-me rooms (facility). An operator's Tier III centre at Matola opened in March 2025 at US$25m with direct access to a subsea cable (centre), and a network operator announced co-location into the independent facility in July 2026 (co-location). 2023-02-07 - a carrier-neutral operator opened a facility in central Maputo with about 80 racks in its first phase, the local landing point for 2Africa cable equipment, on a 400 kW utility feed with about 156 square metres of data-hall floor.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Namibia	About 1.4 MW is live across about three facilities by a 2024 market estimate, and two commercial data centres are named as established; occupancy at the purpose-built site rose to 62 per cent in the year to June 2025. No load figure is held for either named facility (facilities). A market brief puts about 1.4 MW live across about three facilities in 2024, with one purpose-built: a Tier III site outside Windhoek opened in August 2022 on N$123m (US$7.5m) at the Equiano landing. The 1.4 MW is an analyst's estimate. The purpose-built site's operator reports 62 per cent of its co-location capacity for 104 client organisations occupied in the year to June 2025, against 40 per cent a year earlier. They are the whole of the country's operating data-centre estate on this record, and the case for hosting compute in the country rests on the subsea landing rather than on installed capacity.	MOVEMENT on the operator's own occupancy figures
Niger	The national data centre was described as near complete in June 2026, after a feasibility study and a tender. One facility carries this indicator and it moved through the window. A feasibility study for the national data centre sits behind a tender issued by the state information systems agency in February 2026, and the centre was described by the minister as near complete in June. It is specified at the third tier and was reported alongside the trans-Saharan backbone. No aggregate national capacity is published — no rack count, floor area, power draw or commercial provider beside the state one. What exists on the repository is a single government facility approaching service, with the hosting rules for it still unwritten.	MOVEMENT
Nigeria	About 26 facilities carry 50 to 56 MW of declared live capacity on one count and about 28 MW on another, with a US$250m hyperscale campus and a 4.5 MW operator facility among the builds. A credit rating agency puts national capacity at about 197 MW in September 2026, a third basis again (rating), and a development financier puts data-centre foreign direct investment above US$5 billion since 2020. In build are a US$250m campus toward about 100 MW (campus), a 38 MW operator facility at over US$120m (build) and a colocation site expanding to 24 MW by 2027 (expansion), part-funded by an IFC loan invested in May 2026. A 1 MW facility in Port Harcourt was ready in December 2025, the first capacity outside Lagos built to carry international traffic, and the 4.5 MW operator facility was certified Tier III as constructed in September 2025. Announced and not started: a 20 MW facility in Ogun State on its developer's own gas plant, at over US$400m, a carrier-neutral Lagos facility with no capacity stated, and a US$1.87m feasibility study for two sites of 60-70 MW in Lagos and Delta states. Earlier builds include a 20.65 MW facility at Eko Atlantic launched in 2021. 2026-09-28 - a market assessment counts 21 operational facilities and 16 upcoming, and an industry forum put IT load at about 50 MW against a five-year target of about 200 MW.	MOVEMENT
Rwanda	A national data centre is named in the sector plan with no capacity, load or ownership figure published, and the country hosted no hyperscale facility as at March 2026. The facility is named in the ministry's sector plan for 2024 to 2029 and no capacity, load or ownership figure is published anywhere the repository holds (centre, plan). Data centre and cloud service directives issued in 2023 govern the national facility, and they are dated only by the sector plan because they carry no date of their own (directives). 2022-11 - a pan-African operator announced a 2MW Kigali facility with ground-breaking set for early 2023; no ground-breaking or opening is on record. Beyond one national facility with no published capacity, the only commercial build on file is an announcement with no follow-through recorded.	NO CHANGE
Sao Tome and Principe	The procurement agency tendered servers and disaster recovery for the digital identity data centre, and the decision is not confirmed. The tender covers servers and a disaster recovery arrangement for the identity data centre, inside a wider government data-centre modernisation (tender, mission). The tender's own body is an attached document that has not been read, so scope, value and specification are unstated. No award or decision is confirmed. That a disaster recovery arrangement is being procured alongside the primary is worth noting: it is the only redundancy design named anywhere in this ledger.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Senegal	The national data centre was commissioned in June 2021, and an analyst puts the commercial market at about 1.8 MW of live load across about five facilities in 2025. A commercial facility broke ground in January 2025; its target year has not expired, so it is not recorded as stalled (groundbreaking, build). The count of data centres operating reaches the repository only as a continental reference-study figure at mid-2025; no domestic primary count is held (count). The commercial estate is operator-built: a Tier III-design site at Diamniadio from 2017, Sonatel's Rufisque site, certified as constructed in December 2019 with its certificates reported maintained in 2023, and a carrier-neutral site at the Almadies landing station due in late 2023 with no completion on file; three Dakar facilities announced by a Moroccan operator have none in service on the record. 2025-10-27 - a telecoms group's data-centre arm offered banks a Tier III site at Diamniadio, the tier being its own claim. An analyst puts live critical IT load at about 1.8 MW across about five facilities in 2025, against 1.6 MW in its 2024 estimate. 2026-10-02 - the operator reported expanded data-centre capacity; no capacity or cost figure is stated.	NO CHANGE
Seychelles	An operator data centre was built under a turnkey project relocating and modernising the network into a hybrid network cloud. The turnkey award was made in December 2021 (project). Its continued operation is inferred only from the 2026 fifth-generation launch it enabled. No capacity, tenancy or availability figure is published, and no other data centre — commercial or government — appears anywhere in this ledger.	NO CHANGE
Sierra Leone	A national data centre was commissioned in April 2026, an identity agency facility was reported operating in August, and an operator backup facility opened in November 2025. The national facility at the regulator's headquarters was commissioned by the head of state in April 2026 (national). The identity agency's director-general reported a tier-three facility operating in August 2026 (identity), and an operator opened a backup facility outside the capital in November 2025 (backup, figures). Three facilities commissioned inside eighteen months, and no capacity, tenancy or redundancy arrangement is published for any of them. 2022-06-09 - an operator began building a seafront data centre in Freetown, first for its own disaster recovery and later for third parties; no scale, completion date or later account is held.	MOVEMENT
Somalia	A national data centre described as nearing completion in May 2025 was described as planned fifteen months later, and the record does not reconcile the two. The state minister restated it as planned in August 2026, having been toured in 2024 and described as nearing completion in May 2025 (plans, completion, tour). The ministry's stated rationale — to end reliance on data storage outside the country — is also its statement that government data was held offshore when it spoke. The one operating estate is a commercial operator's, stated to be investing in further local data centres and in solar-powered network sites, with no capacity, tenancy or customer figure published (operator, green). A carrier-neutral data centre at the Mogadishu cable landing was expected in operation by the end of 2022 when its wholesale-carrier parent raised US$124m of equity in November 2021; no opening is on record.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
South Africa	Delivered load moved from about 350MW to about 390MW, with one 50MW facility the only completed build of scale in the window. 2026-08-27 — a metropolitan council approved connecting a proposed hyperscale campus directly to the national utility for up to 556MW. 2026-09-03 — the largest announced pipeline was restated at about 160MW under a R7.5bn programme; the July rezoning for its Cape Town site is under appeal. 2026-09-10 — Amazon Web Services' Cape Town region, open since April 2020, carries 154 services, its own figure. 2026-09 — a buyer linked to Old Mutual's infrastructure fund manager took sole control of the 16MW JNB11 facility from Vantage Data Centers: capacity changing hands, not added. A ratings agency rates water resilience relatively low against more than 60 known centres at about 500MW disclosed. The standing estate is largely foreign-owned. Microsoft built the first hyperscale cloud in the country, Huawei Cloud has served Johannesburg since 2019, Oracle since January 2022 and Google since January 2024; the largest colocation operator and its internet exchange have been majority-owned by a US company since August 2022, and Visa processes domestic card transactions in its own Johannesburg data centre. 2026-10-05 - a hosting provider for online gaming announced its first African data centre, in Johannesburg; site and capacity are not disclosed.	MOVEMENT marginal against announced pipeline
South Sudan	The national data centre was described as halfway complete in April 2026, while the regulator in January described the operator as managing critical data centre infrastructure in the present tense. The two accounts do not agree and the later one reports less progress (halfway, interest). Both are ministerial or summit statements. No construction record exists in any reachable published source: the regulator's publications page carries five documents and none concerns it, the ministry publishes nothing after December 2025, and the operator has made no statement. It is not donor-financed — the lender's project carries no data-centre workstream — so no procurement record exists where one normally would, and the operator is a privately held Swiss company of about nine people that files no public accounts. An oversight committee for gateway services and the data centre was constituted with that same company in January 2026, and no output from it is on record (committee).	MIXED a national data centre described as halfway complete in April 2026 after being described as operating in January, with no construction record in any reachable source
Sudan	A 1,300 square metre state data centre was restored and made operational after war damage, and an alternate national data centre is announced with no construction start date. The restored facility is equipped for cloud computing, data security and artificial-intelligence application hosting, and is distinct from an operator's separately reported facility in the same city, a claim not corroborated in this pass (restoration). An alternate national data centre at the wartime seat of government is announced as one of the ministry's future projects with no construction start date (alternate). No capacity, load, tenancy or ownership figure is published for either. A mobile operator built a disaster-recovery centre in Port Sudan in March 2024 after its network shut down completely, and its group reported a new data centre established there in the first half of 2025. No capacity figure is published.	MOVEMENT
Tanzania	A commercial data-centre estate is counted in a sector review, a tier-three facility hosting the national internet exchange has had no update in seventeen months, and a local cloud exchange platform launched here first. The commercial count is a trade-magazine count rather than a regulator's, and it sits alongside a separate count of public centres which is the state's own and is not the same measure (estate). The tier-three facility's second phase launched in March 2025 and hosts the national internet exchange to keep domestic traffic local; seventeen months with no update is the finding (facility, phase). A cloud exchange platform launched here as its first market in November 2025 at month precision (exchange), and a further site is named at group level on a funding item tagged to seven places with no local site, size, cost or date given (site). 2023-10-10 - a regional carrier introduced the country's second Azure hyperconverged stack in a carrier-neutral data centre, having brought the first in 2021; no capacity or customer figure is stated. An older operator estate is also held: colocation offered in 2022 in ISO 27001-certified data centres in Dodoma, Mwanza, Arusha, Mbeya and Dar es Salaam, with no capacity stated for any site.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Togo	A national data centre is certified to the third tier and wholly owned by a state company, with no commissioning date, capacity, utilisation or customer figure anywhere in the repository. The certification and state ownership are as reported (centre). Nothing else about it is published. A tier-three facility in state hands with no capacity figure is the whole of the country's hosting record on the physical side. A private operator launched a cloud hosting and backup offer on servers in Togo on 17 October 2024, with no capacity or customer figure published.	NO CHANGE
Tunisia	Data centres are a named project line in the development plan annex, and a non-binding memorandum was signed for a facility at a coastal city. The plan annex carries data centres as a state investment priority (plan, strategy). The memorandum with an equipment supplier is non-binding and was signed in February 2026 (memorandum). The commercial estate is known from its operators: one inaugurated a 1,000 square metre site of Tier III quality outside Sousse in May 2025 (data centre), another claims the country's only Uptime Tier IV certification, and a third reported 2 MW in operation and a 25% market share in November 2025. A commercial directory recorded no direct on-ramp to any cloud provider as at September 2025, with power at USD 0.08 per kilowatt-hour (directory). Older and smaller sites are on the record too: a carrier-neutral site at Enfidha opened in 2013 and certified PCI DSS in 2019, and the Tier IV operator launched a national cloud platform reported in its parent group's 2024 accounts. No country-wide capacity or facility count is published, so the priority is stated and the estate is unmeasured. 2026-10-06 - an operator and an IT services firm announced a partnership for cloud resources hosted and operated in Tunisia; no capacity is stated.	MOVEMENT
Uganda	A colocation facility operates outside the capital, a green tier-three build finished construction in March 2026 after two missed dates, and an edge site is named with no date or capacity. The colocation facility offers 1,000 sqm, up to 250 racks and 1.5 MW of IT power, and a bank moved its core operations there in February 2026; its capital figure is group-level across seven markets, not national (colocation, stack). The green build missed a late-2025 date and then a first-quarter 2026 date (original, rebase); by March 2026 civil works and technical installation were complete, with launch given as September 2026 in one account and July in another (cleared, site visit). No opening is on record. The edge site is named as a future site with no date or capacity attached (edge). No national capacity figure appears anywhere in this ledger.	MOVEMENT construction complete but no facility opened
Zambia	A memorandum on a national artificial-intelligence data centre was signed with the vendor that built the existing national data centre a decade earlier. The memorandum is not a contract, and the same vendor built the existing national facility (memorandum, centre). The existing facility's phase one commenced in January 2016 under a Chinese concessional loan, and it is the only state data-centre facility the repository describes in physical terms (centre). An edge data centre plan names the country among target countries on a company statement of intent rather than a commitment (edge). The commercial market can now be sized, and it is very small: about five live facilities carrying roughly 2MW of live critical IT load at about 60 per cent occupancy, on roughly $5 million of annual revenue, with nothing under construction and a further 2MW or so in long-term pipeline. Critical IT load per million people lags Botswana, Kenya, Côte d'Ivoire and Ethiopia, and the estimate is an analyst's rather than an operator or regulator disclosure. 2021-10-01 - a 1 MW carrier-neutral facility opened in Lusaka on about K140m (US$5.75m), after a Covid delay. In March 2023 the government signed a memorandum for another operator to build a commercial data centre and supply cloud services to the state, with no amount, site or date given; nothing after it is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zimbabwe	An operator commissioned a 5 MW facility in June 2025, which alone exceeds the about 2 to 2.5 MW analysts put on the whole commercial estate three weeks later. An operator commissioned a 5 MW data centre in Harare with a continental data-centre operator and began onboarding corporate clients at the end of June 2025, selling it on guaranteed power availability against load shedding and stating an intention to double it to 10 MW (facility). The market brief, commissioned by a European facility, gives both about 2 MW and about 2.5 MW for the national live load (capacity). One commissioned facility of 5 MW and a national estate of 2 MW measured three weeks apart cannot both be right, and nothing on file reconciles them. The technology park's groundbreaking is expected in the fourth quarter of the financial year, with capacity, cost and completion date unstated throughout (park, approval, ai-ready). The state operator's facility is described as a tier-three environment on its own undated product page, not certified or dated (state facility). It runs Harare and Mazowe from 2017, and Bulawayo from April 2022 with 120 racks and 400 kW; in 2022 data centres were 1% of its revenue and Mazowe held 34 racks. A US$15m carrier-neutral Tier III facility pledged by an IT provider for June 2026 has passed that date unbuilt on the record.	MOVEMENT

Local data centre capacity (national providers)

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	The second national data centre at Blida obtained Tier III Design certification in September 2026. The digitalisation commission's communique names Blida as the second national data centre - an existing, built facility that has passed an Uptime Institute design review - and dates the identical certification of Mohammadia to February 2026. Installation at Blida began in March 2025. It certifies the design and not the constructed facility: the commission says it is still working towards Tier III Certification. No rack count, floor area or delivered load is held for either site. Older state sites stand beside them: the state operator inaugurated a data centre with a cloud platform at Constantine in 2023, publishing no specifications, and university pre-registration runs from a national data centre at the national computer-science school (2025). The National People's Assembly opened a data centre of its own in October 2024, with later phases unfinished. 2026-10-04 - a data centre described as wholly sovereign was inaugurated at Akbou; its capacity and operator are not stated.	MOVEMENT
Angola	The government data centre was inaugurated in April 2026 at 208 racks and 1,040 kW, carrying a national cloud under a mandatory migration. The same day, a unified government cloud entered operation under a progressive and mandatory migration of public services, framed as repatriating passports and education certificates from foreign platforms, against a first stone laid in September 2025 with a migration mandate stated and nothing yet to migrate onto. No source records how much has actually migrated, so the capacity is established and its use is not. 2026-09-02 — a commercial operator disclosed a data centre installed at Lobito as the technical support and data-management platform behind its coastal internet and television services (inauguration). No capacity figure accompanies it. 2026-09-11 - the state printer opened a data centre with more than 170 TB of storage, the one facility here with a stated capacity. 2026-09-12 — the state press opened its own data centre, stated to end dependence on foreign solutions for producing and certifying high-security documents. No capacity or cost is published.	MOVEMENT
Benin	The national data centre runs at Abomey-Calavi under the state-owned SBIM with no capacity figure held, and a feasibility study for a redundant second site closed in March 2026. The national data centre is in operation at Abomey-Calavi, run by the state-owned SBIM, with no capacity, tier or tenancy figure held. 2026-03-27 — submissions closed on a technical, economic and legal feasibility study for a redundant second data centre, tendered under the regional digital integration project, not necessarily sited in Benin, to be completed within six months. The existing site spans 300 square metres. A single unmeasured facility carrying an exchange that moves 32.7m requests a month is the risk the study exists to address, and the study's own six-month deadline falls at the end of September 2026, so nothing on the record yet says what it concluded.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Botswana	The state data centre is in operation, Tier III certified and carrier-neutral, with critical government services migrated and the mid-2026 phase unconfirmed. 2025-11-25 — the state-owned data centre launched after Tier III certification in October 2025, carrier-neutral, offering storage, hosting and exchange, against a facility built but neither certified nor launched at the window's opening. 2026-05-06 — critical government services have been migrated, with the initial phase targeted for mid-2026 and no confirmation on file that it completed, against a stated intention to migrate services held at the shared digital services department. A second data centre is stated as planned with nothing further on file. The facility is the physical precondition for the localisation duty announced under policy, and the migration is the test of it — reported, so far, only in the words "critical services". Two older state facilities sit beside it: the state operator's Sentlhaga site, billed in 2020 as the country's first Uptime-certified facility, at Tier II with 120 square metres of floor, and carrier-neutral colocation at the state innovation hub, selling racks and power only. No later capacity or utilisation figure is held for either.	MOVEMENT
Burkina Faso	Two modular government data centres entered service in January 2026 at about 3,000 terabytes, ten times the prior capacity, carrying a government cloud with a bigger centre announced for 2028. 2026-01-23 — two modular data centres were commissioned at about 3,000 terabytes combined, ten times the prior capacity, with more than 7,000 virtual machines at 100 to 300 per ministry, at FCFA 16bn and run by national teams, against construction with cost then given as over FCFA 15bn. Projected savings are stated two ways, about FCFA 30bn over five years and 85 to 95bn over ten. The same day, the government cloud entered operation on those facilities, to host, operate and secure all public data and to repatriate data still stored outside the national territory, with no capacity, operator or cost published by the government itself. 2026-01-27 — a national big data centre was announced for 2028 to repatriate public and private data, with no cost, siting, tier or procurement on record, the modular pair explicitly framed as the interim step to it. 2026-10-09 - the digital-transition minister put the national data centre planned for 2028 at an estimated FCFA 20bn.	MOVEMENT
Burundi	A national data centre is named a mid-term priority of the World Bank programme, with no build, site or date on file. The data centre is named as a mid-term priority alongside public-finance modernisation and the national identity card. No build, site, capacity or date appears, and no baseline was held before it. It is the only data centre of any kind on this ledger — no commercial facility, no colocation provider and no hosting arrangement is recorded for the country. The sovereign cloud pillar of the artificial-intelligence strategy is built around this facility, so a strategy adopted in April 2026 depends on a building that has not been started.	NO CHANGE
Cameroon	The Zamengoe data centre is in operation and being shown to prospective tenants, the central bank having inspected it in December 2025. The facility was shown to the telecoms minister as operational in July 2020, and in December 2025 the regional central bank's national director inspected it with a view to hosting. 2026-06-09 - it was presented at a national digital forum as in operation and tourable, and on 13 August 2026 a second prospective tenant was shown round. The largest-in-Central-Africa and Tier III claims are unverified wire claims and are not adopted here. No IT load, floor area, customer count or contracted power figure has been published, and no tenancy is reported signed. 2023-12-05 - a Cameroonian operator launched a cloud platform hosted on servers in the country, offering web hosting, virtual servers and email; no capacity or customer figure is published. The postal operator's data centre, built by a Chinese vendor with 710 km of fibre and a satellite hub linking 250 post offices to it, was inaugurated in 2018; no later account of it is held.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Cape Verde	The state operator forecasts hosting and cloud revenue of CVE 127,494,000 for 2026, up 5.1%, inside a total forecast down 26%. The Praia data centre is in operation and Tier III certified, having billed connectivity of CVE 305,779,000 and protocolled state services of CVE 455,964,000 in the year to 31 December 2024. No accounts have been published since that volume, so no later certification, capacity or utilisation statement is held, and no floor area, rack count or installed electrical load is stated for any facility in the country. Hosting and cloud lines move up while the whole forecast moves down: housing CVE 26,994,000, infrastructure services 72,025,000, platform services 9,359,000 and software services 19,116,000 for 2026, CVE 127,494,000 combined and up 5.1% against CVE 121,274,000 forecast for 2025. Both are board forecasts, not outturn, and untested.	MOVEMENT
Central African Republic	Nothing is built: a vendor package puts a national Tier III data centre as its first axis, the fifth thread on the same unbuilt facility. Two ministry facilities were recorded under construction in 2022 with no completion record, and a memorandum signed in January 2025 never advanced. 2026-05-27 — a vendor delegation met the ministry on a four-axis package whose first axis is a national Tier III data centre, confirmed the following week. The 2026 pitch repeats a 2022 target for the same facility: five threads, three sponsors, and nothing built at July 2026. The same package's second axis is a dedicated network of five microwave-relay sites interconnecting ministries, with no contract, site list, financing or timetable held. So the state's hosting position is unchanged and its ministries remain unconnected to each other, which is what the minister's own January 2026 statement about heterogeneous state information systems describes. 2026-09-24 — fire damaged part of the electoral authority's data-processing centre, weeks before the October 2026 residual elections; an investigation is open and no cause or damage estimate is given. It is the one state data facility in operation that the repository names, and it is the one that burned.	NO CHANGE
Chad	The national data centre was audited and put toward certification in February 2026, with a foreign firm explored in July to finish the work. The building exists and is not yet in service. The development agency's own account records a national data centre built but not yet audited, certified or in official operation, with a joint audit and certification mission run with the security agency and a technical firm in February 2026, naming the build partners. Five months later the state was exploring a partnership with an American firm to audit, certify and secure the centre before commissioning, following a June 2026 mission — an explored partnership rather than a signed contract or an inauguration. Alongside it, one hundred government micro data centres are planned. No capacity figure is published for any of them.	MOVEMENT
Comoros	A public-administration data centre entered service in May 2025, and the finance ministry tendered two more. 2025-05-19 - a data centre was inaugurated, certified to the third tier with a stated hosting capacity of 44.4 terabits, co-managed by the digital agency and the state cable company, its construction completed shortly before. Tier and capacity are agency-reported, the service-entry date is disputed between accounts, and no capacity utilisation, redundancy arrangement, tenant list or operating-cost figure has been published in the fourteen months since. 2025-12-22 - the finance ministry tendered primary and backup data centres on French development financing, covering structured local and wireless networks, firewalls, intrusion prevention, security event management and two network operations centres, with bids opened 16 February 2026 and no award, contractor or delivery date recorded - a second and third state data centre procured by a different ministry from the agency's.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Congo	The Bacongo national data centre is at 82% and due in service by end-2026 or early 2027, after works were suspended at 95% in October 2025. 2025-10 - the contractor suspended works at 95% completion and threatened withdrawal if the final tranche foreseen in the funding protocol was not released by month end, after inauguration had been announced for November 2025. No amount is stated for the unpaid share and no position later than October 2025 is held on the financing. 2026-08-10 - the state operator showed the minister a real-time security operations centre running across its Brazzaville, Pointe-Noire and Oyo data centres, alongside nationwide fibre connectivity. It is an assertion made in passing at a ministerial visit; no capacity, certification, utilisation or independent account of any of the three sites is held, and a minister had already referred to a data-centre inauguration as an accomplished fact in January 2026. 2026-09-22 — inspecting the site, the vice-prime minister put works at 82% and operation at the end of 2026 or early 2027, with energy tests within a month, backed by a 12 MW solar farm because grid power alone would deter clients. The 82% does not reconcile with the 95% reported a year earlier, and the facility is not in service.	STALLED the national data centre not yet in service and two delivery dates missed
Cote d'Ivoire	The sovereign national data centre was formally authorised at US$170m in July 2026, with no site or completion date stated. At the window's opening the facility sat at the core of the digital city project with construction reported begun in May 2025 and US$66m approved in August 2025. 2026-07-16 - the project was formally authorised at US$170m in export-credit financing, its scope now a sovereign national data centre, a government digitisation platform and a smart-border surveillance system. 2026-09-07 - the United States export credit agency's board approved a guarantee of US$66,138,119 on 21 August 2025, the finance and budget ministry borrowing and the digital transition ministry the end user, a fraction of the US$170m the government authorised. Opening of the state data centre is targeted for 2027 at an estimated US$66 million, specified at 1.73MW of IT capacity within 3MW of total power, 228 racks and 10 petabytes of storage (target). An earlier state project is held without an outcome: a Huawei-financed e-government data centre of about US$30m near Grand-Bassam, launched in November 2012, has no completion on record.	MOVEMENT
Djibouti	A US$1.35bn memorandum for an artificial-intelligence compute centre and special economic zone was signed on 19 July 2026, valid one year. The project did not exist at the window's opening. 2026-07-19 - a US$1.35bn memorandum of understanding was signed, valid one year, with no investment protocol, no disbursement and no site, set out by the signing minister and presented as an innovation-pole partnership. The stated 100 MW capacity is the promoters' own, and no feasibility study or site is on file. It is by an order of magnitude the largest figure on this ledger, and it is a one-year memorandum.	MOVEMENT
DR Congo	The enacted 2026 finance law carries FC 26,756,546,346 for national data-centre acquisition, with no procurement or site held. No national data-centre appropriation is established at the window's opening. The enacted 2026 budget carries FC 26,756,546,346 for national data-centre acquisition. No procurement, site, operator, specification or execution evidence is held, and no 2026 execution data has been published at all, so an appropriation is the whole of it. Set against the prior year's payment rate of just over half the revised credit on the same section, an appropriation on this line is a weaker signal here than it would be elsewhere.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Egypt	The second regional hub is now put one to two months from operating after its end-2025 date passed unconfirmed, and a majority-stake sale was cancelled. The second hub was design-certified to Tier III with an estimated IT load of 4.6 MW against the first hub's 2.5 MW and completion expected end-2025. No held source states it entered service, and the stated date has passed; the first hub is stated as reaching full utilisation within a year of opening. 2026-07-17 - the board withdrew from an agreement announced in September 2025 to sell 75 to 80% of the regional data-centre hub, citing unmet conditions, and the hub is instead to be carved out as a wholly-owned subsidiary with its own technical and commercial team. Consideration and the specific unmet conditions are not disclosed, and the stated reason is transactional rather than sovereigntist. 2026-08-28 - the chief executive told the half-year results call that phase two is expected to begin operating within one to two months, on economics improved against phase one, with further projects screened on return, payback and business model; the carve-out continues and the finance chief said retaining the business is worth more than the cancelled sale. No entry into service is stated: a second schedule against a first that passed.	MIXED the incumbent's second regional hub passed its stated completion date unconfirmed while the sale of a majority stake in its data-centre unit was cancelled and the unit brought back in-house
Equatorial Guinea	A tender was published for a primary data centre in one city and a solar-powered backup in the other, for public financial data. It follows data-economy actions including data centres validated with the World Bank in December 2025 (validation), and covers storage, processing and backup (tender). What exists today is two technical facilities described in the state operator's own factsheet, one in each city, each with two generators and ten nodes with distribution and transmission equipment; no floor-area, power or storage figure is given, and the document's content narrates 2016 and 2017 work despite a 2025 upload path (factsheet).	MOVEMENT
Eritrea	The only national provider is the state operator, whose private cloud runs in its own data centres. No capacity figure is published at any date. National capacity and total capacity are the same number here, because the state operator is the only provider on the repository. Its private cloud offers storage tiers of 100, 250 and 500 gigabytes for 20, 50 and 100 users, hosted in its own facilities. Those are subscription sizes rather than a statement of the estate behind them, and nothing published says how large that estate is, where it sits or how it is powered. The grid it draws on delivers 52 MW reliably against 74.3 MW of demand, which is the practical ceiling on how much of anything can be hosted here.	NO CHANGE
Eswatini	The National Data Centre has been complete since 2021 and no rack, power or utilisation figure has been published for it since. The 2021 budget speech records the National Data Centre complete at the science park, and government pursuing amalgamation of its computer services department into the park to centralise ICT resources (speech). Five years on the centre is named a structural concentration of state information, with no capacity disclosure (rack count, megawatts or utilisation) at any date; the only tier on record is the operator's own Tier III description. 2026-09-22 — the finance minister told Parliament the facility does not constitute a fully operational data centre. Power for it is still being sourced five years after the facility opened. Separately, E35 million was allocated in the 2026/27 budget to upgrade the government mainframe, the budget speech naming frequent downtime as the reason (budget speech). 2026-09-24 - the operator confirmed an incident affecting the facility that disrupted at least 12 government services, without confirming claims of a hack or ransom demand. 2026-09-28 - police engaged INTERPOL over the data-centre incident and will investigate after a consultant reports; preliminary findings reportedly show corrupted files and no data stolen.	REGRESSED the finance minister says the one national facility is not fully operational

COUNTRY	DEVELOPMENTS	PROGRESS
Ethiopia	An in-country cloud exchange went live in April 2026, selling compute, Kubernetes and storage priced in birr and hybrid with two global clouds. The platform offers compute, Kubernetes, drive and security services priced in local currency and interoperating with two global cloud providers, and its operator frames it as compliance with local data rules (cloud exchange). 2021-05 - the state operator opened a Huawei-built modular data centre at Gola Sefer with five pods and room for up to 800 servers; by May 2022 close to 90 enterprise customers were co-located there, with a 1,000-rack green data centre in preparation. 2020-09 - the innovation ministry planned a Tier III national data centre at the technology park for government workloads, due in 2021; in September 2022 it was reported to be building a facility in the park, and no completion is on record. No capacity, customer count or price list is published for the cloud platform, and neither state facility has a published capacity or utilisation figure.	MOVEMENT
Gabon	A first national facility was inaugurated at a special economic zone in July 2026, and a state-owned second is under construction. The first facility carries 92 racks over 3,000 square metres and 1 MW installed at XAF 8bn, connected to two submarine cable systems, after delivery slipped twice from the groundbreaking of August 2025 (inauguration, specification). A state company is building the second, with 160 racks and over 1 MW, commissioning stated for end-November to early-December 2026 and no cost published (site inspection). A third is at agreement stage: the national data centre convention signed before the President in June 2025 (convention) became a strategic agreement of 28 January 2026 for a 20 MW facility in Libreville, built by a contractor that laid a symbolic foundation stone in March 2025, with the state to add a 20 MW gas plant; no cost or completion date is published. A framework memorandum on secure infrastructure, cloud and digital identity has no workplan, value or deliverable published (framework memorandum).	MOVEMENT
Gambia	A national data centre was inaugurated in June 2026 and hosts the national identity management system. It was opened alongside the identity system itself on 30 June 2026 (inauguration). No capacity, tier rating or operating cost is published, so the state's own hosting position is established by an opening ceremony and by the one system known to run in it.	MOVEMENT
Ghana	The state's own data centre, in service since 2016, was put to international tender for a refresh and upgrade on 12 June 2026. 2026-06-12 - the communications ministry invited international bids for a refresh and upgrade of the national data centre, financed by the World Bank under the digital acceleration project; no contract value, capacity or completion date is published. The facility was launched in January 2016 with a primary site in Accra and a secondary site in Kumasi, run by the information technology agency for ministries and agencies, and in July 2026 it was said to be being modernised for artificial-intelligence workloads. The state petroleum corporation was reported in September 2020 to have built its own data centre for exploration and production data. No capacity figure is published for any state-owned facility.	MOVEMENT
Guinea	A national data centre certified to the third tier was inaugurated at Conakry in September 2025. It is externally certified, and a year on the prime minister found it not fully operational, about 90% complete with a payment outstanding (inauguration). No rack count, power capacity, occupancy, tenant list or hosting policy is published for it, so the repository records a building and nothing about what runs in it. 2026-01-06 - the central bank tendered for a consultant to fit out its own data centre and take it to Tier III certification, from its own resources; no award is on file. 2026-09-14 — the national data centre is about 90 per cent executed on roughly US$10m and still not operational, with the prime minister demanding to know what would bring it into service. 2026-09 — the prime minister ordered faster commissioning of the Koloma national data centre, about 90 per cent built on close to US$10m and still not fully operational.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Guinea-Bissau	The state's own hosting is a budget line and a scoped national cloud, not a facility. The feasibility study of September 2025 scopes a national cloud along with a security operations centre and an incident response team; nothing has been built. The 2026 budget names a data centre inside the digital transformation investment line. Neither source gives a location, a capacity or a delivery date. An earlier plan put the data centre in a EUR 1.93m Japanese-financed building for the administration-modernisation institute, announced in March 2024, with no construction record since.	MOVEMENT
Kenya	The state data centre runs 706 kW certified capacity against about 300 kW actual load, hosting 145 of 451 government institutions. It has 144 racks with 100 in use and is certified to the third tier in design and construction; expansion to 288 racks and 1 to 2 MW is being structured as a public-private partnership, and no allocation for it was disclosed at FY2026/27 budget day against KSh 3.1bn the year before (capacity, budget). Three sovereign clouds run on commercial premises instead: one billing in shillings with zero egress and in-country residency (sovereign cloud), a graphics-processor platform for artificial-intelligence workloads with no capacity or customer figure published since launch (artificial intelligence cloud), and a hyperscaler region confirmed at more than 20MW when fully built and up to 50 kW per rack, still listed as coming soon (cloud region, announcement)). 2026-09 - an Indian IT group's sovereign cloud went live at a Nairobi colocation campus for agencies and regulated sectors with data-residency needs; its capacity and clients are undisclosed.	REGRESSED the state facility's expansion moved to a partnership route with no allocation disclosed
Lesotho	The incumbent operator runs two commercial data centres; the state's own hosting is still in build. 2026-08-29 — the operator names two facilities, at Maseru West and Lekokoaneng, the strongest current self-description held. 2025-08-01 — the regulator opened procurement for disaster-recovery IT equipment. 2026-05-07 — the minister raised a high-performance computing upgrade and pitched data-centre investment at the United Nations. 2021-10-04 — a contract was awarded to assess the government's three data centres for interoperability. 2025-09-26 — a three-year LSL 35.6m contract to replace end-of-life government data-hosting equipment was awarded. No floor space, rack count or power figure is published for any facility in Lesotho.	MOVEMENT
Liberia	A national data centre was announced in July 2026 to hold government data domestically, with no site, cost, timetable or operator named. The announcement came from the posts and telecommunications minister (announcement). A separate facility at Buchanan is stated as under development for sovereign hosting of the identity registry and the revenue authority, again with no cost or completion date published (Buchanan facility); an operator said in July 2025 it was building a Tier III+ data centre in Buchanan, and the sources do not say whether the two are one site. Neither is the same project on the record, and the data governance policy that names the second sets a rule for data leaving the country that neither facility yet lets it obey. The central bank sought an owner's engineer in November 2025 for a purpose-built facility to house interbank payment and settlement operations, after a US$3.9m grant received in March 2023 to upgrade its main and disaster-recovery data centres. No award, site or completion of the upgrade is on record. An older state project is held without an outcome: the state operator said in July 2017 it was building a national data centre to host government data and applications, and no completion is on record.	MOVEMENT
Libya	A tier III design certification is recorded for the national telecom company's KM-4 site, with no capacity disclosed. The certification record is the first independent assessment of a Libyan facility the repository holds. It certifies design rather than construction or operation, and discloses no capacity figures. The regulatory frame is behind it: the regulator floated a first data centre and cloud licensing framework in February 2026, at which point storage firms were operating unpermitted. A ministry opened its own data centre in April 2026.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Madagascar	Two renewable-powered national data centres were confirmed in June 2026 as securing the identity system, with no commissioning date published. Tenders opened in December 2025 for rehabilitation of the main data centre and the identity-card personalisation centre (tenders). The two centres were confirmed at a portfolio review in June 2026 as the facilities securing the identity system (review). No capacity, commissioning date, operator or resilience arrangement is published. Two earlier state data-centre plans have no opening record: a government cloud data centre announced in March 2021 for the regulator's compound, and the data centre in a Huawei-built network modernisation project whose security equipment was handed over in December 2022.	MOVEMENT
Malawi	The national data centre is the local-hosting base for the data exchange and is being upgraded, and the revenue authority has a secondary facility in service. The acceleration project's management plan for the government data centre states a Tier III design with uninterruptible supply, batteries, generators, cooling and fire detection, thirteen empty server racks and fifteen servers with two 42U racks installed, and a service power line still to be built (plan). It gives compute rather than electrical capacity - 277.2 GHz of processing, 2.63 TB of memory and 107.52 TB of disk - so the facility's delivered load is still not held, and the Tier III figure is a design requirement rather than a certification. The electricity utility runs a 42-rack Tier III centre in Blantyre with 595TB of storage, calling it the National Data Centre (October 2025). The Blantyre national centre hosted 78 virtual machines for ministries, agencies and private clients in February 2024, against ten four months after its 2022 launch. A 36-month managed-services contract was tendered for the Lilongwe primary site, with Blantyre as its disaster-recovery site; no service catalogue or tariff for agencies is published. 2026-10-01 - a stop-gap expansion added 115 TB of storage and the Lilongwe-Blantyre redundancy link was completed in the first half of 2026.	MOVEMENT
Mali	A Tier III national data centre was inaugurated in Bamako in January 2026, hosting state data and framed to carry mutualised regional infrastructure. The centre entered service on 31 January 2026 with stated availability of 99.982 per cent (launch, opening). It hosts state data and is framed as able to carry mutualised infrastructure for the three confederation states (account). No capacity in racks or megawatts, no customer count and no commercial facility elsewhere in the country is recorded.	MOVEMENT
Mauritania	A EUR 15m Tier III national data centre has been in service since May 2025, and a national cloud launched on it in June 2026. The data centre was inaugurated on 8 May 2025, European-financed at EUR 15m and certified, operated by the international telecoms company (data centre); no capacity, utilisation or migration figure has been published since (data centre, construction). The national cloud launched in June 2026 to host government data and services domestically and centralise public information technology, with no migration timeline, capacity or cost disclosed; as at August 2026 it was in data-security testing and migration preparation ahead of go-live (launch, testing).	MOVEMENT
Mauritius	The Rose-Belle facility was certified to the highest resilience tier in December 2025 and is to host the government portal, the identity wallet and government artificial-intelligence equipment. It is to host electronic health, the government portal, the mobile identity wallet, the penalty-points system and government artificial-intelligence equipment, working with the government online centre to supply the backup it lacked (facility). It extends the government online centre, and the repository holds no capacity, utilisation or tenant figure for it.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Morocco	A sovereign compute programme commits MAD 12bn over two phases, with a Dakhla campus, a Rabat sovereign centre and a supplier memorandum behind it. The ministry's April 2026 figures are MAD 12bn over two phases, MAD 5bn for 16 MW at Nouaceur and MAD 7bn for a further 20 MW in the north, giving 36 MW cumulative and 125 direct jobs by end-2027 (platform). A 2025 consortium release had put phase one at over 40 MW, so phase-one capacity has been reduced (release). A 50 MW sovereign data centre at Rabat, placed by the minister in the Technopolis zone in October 2025, is named in the ministry's July 2026 communique as a project a supplier cooperation will feed, still with no cost or date (communique, memorandum). 2026-09-08 - the Dakhla campus was put at 100 hectares and 500MW, in a portfolio taking national capacity towards one gigawatt. The state already runs certified hosting of its own: the finance ministry's main data centre was certified Tier III Facility by the Uptime Institute in February 2025, which the ministry calls a first for the public administration. 2026-10-07 - a British firm announced its appointment to lead design management and procurement strategy for the platform's planned 20 MW facility near Casablanca.	MOVEMENT
Mozambique	A university data centre opened in August 2026, while the state data centre is described as technically capable but underused. The university facility entered service on 3 August 2026 with about fourteen times the storage of the server room it replaces, precision cooling, redundant systems and reinforced physical security, designated to help underpin the country-code domain and the internet exchange and intended to carry research, cloud and artificial-intelligence services; it is donor-financed with no amount stated (inauguration, account). The state facility is in operation and, on an account published by the regulator, technically capable but underused, with state institutions not digitising and structuring their data into it in the absence of a national digitisation and systems-integration strategy; capacity, tenants and hosting arrangements are not stated, and nothing on record establishes where government systems are hosted (assessment, bandwidth). 2025-08-13 - the government signed a memorandum for a pan-African infrastructure fund to finance a new data centre in Maputo and the rehabilitation of the state facility at Maluana; no amount, site or timetable is stated, and nothing later is held. Two government data centres in the north, at Mocuba and Nacala, were listed as upcoming projects in a 2021 US trade note; no construction record is held.	MIXED a new university facility in service while the state's own data centre is described as capable and underused
Namibia	Construction of the national data centre has begun at Kenya House, the ICT minister said in September 2026, while a vendor-built facility for artificial-intelligence workloads is being built on a Chinese commitment. Cabinet directed a concept note and project proposal to the ministry and the Office of the Prime Minister in September 2025, and no site, capacity, cost or date was published by August 2026; the minister said in June 2026 that Angola's national facility had encouraged the plan (concept, proposal, encouragement). A vendor is building smart-city solutions and a data centre with the ICT and home affairs ministries, on a Chinese commitment of CNY 98,000,000 given by the source as about US$14.4m (funding); no signed agreement, annexure or contractor list is held, and an opposition member gives the same commitment as N$245m (funding, talks). 2026-09-23 — the ICT minister said construction of the national data centre had begun beside the new AI institute at Kenya House; no capacity, cost or completion date is published.	MOVEMENT
Niger	The Tier III national data centre was described as near complete in June 2026, nine months after the delivery date of 30 September 2025. Delivery had been targeted for 30 September 2025, at 9.5 billion FCFA with African Development Bank support and 13 per cent executed (target). What was provisionally received on 14 November 2025 was the fibre; the centre is the project's second component (acceptance, reception, handover). A feasibility study to Tier III+ standard and a tender for data-centre and network infrastructure followed in early 2026. No capacity, rack count, delivered load, tenant or operator figure is published for it, so the country's first national facility is recorded as under construction and not as measured. The national data centre's design gives computer rooms a little under 30% of the floor area, half fitted out at delivery, in a government zone and a commercial zone; no delivered capacity is published.	MOVEMENT slipped

COUNTRY	DEVELOPMENTS	PROGRESS
Nigeria	The sovereign wealth fund announced a 100MW hyperscale data centre campus in Lagos (announcement). The sovereign wealth fund's 100MW campus is announced, not built, with no construction start, cost or completion date stated (announcement). The government cloud delivers document storage, mail, content management and electronic signature across ministries (cloud), and a sovereign cloud taskforce inaugurated in August 2026 works against an estimated US$850m a year that Nigerian organisations spend on foreign cloud (initiative, taskforce). A pan-African operator's national sovereign cloud went live in March 2026 (operator cloud), subsidised sovereign cloud opened for startups in May (subsidy), and one build rides partly on a Chinese stack (stack). The state carrier's Abuja shared-services centre holds Tier III certification as constructed, at 0.825 MW built out, and the carrier reported revenue down 11 per cent to N9.41bn and a loss after tax of N214m for 2024. A state-owned company contracted a Makurdi data centre in June 2024 for delivery in six months, with nothing recording it built. A domestic operator reported Tier IV certification in 2019 and described 75.5 MW across three Lagos sites in 2024, 50 MW of it still under construction.	MOVEMENT
Rwanda	Country-hosted artificial-intelligence compute was deployed under a development programme, reported in September 2026 with 42 priority applications identified, where earlier accounts named no national cluster. 2026-09-17 - a development programme's review reports deploying country-hosted artificial-intelligence compute in Rwanda and five other countries, with Rwanda identifying 42 priority applications across eight sectors, and finds data readiness, skills, institutional ownership and financing rather than hardware setting how far it is used. No capacity, host institution or utilisation figure is in the held text. Before it, a named analyst whose author sells sovereign infrastructure reported no national accelerator cluster or sovereign cloud, with a foreign hybrid deployment the only onshore compute named. African-founded cloud and artificial-intelligence infrastructure providers appear in a continental roundup rather than a market measure, with no capacity, customer count or domestic share stated (providers).	NO CHANGE a first account of country-hosted compute with no deployment date behind it
Sao Tome and Principe	The state runs a government data centre and government network dating from 2008, with a fibre backbone begun in 2017, and the identity institute offers hosting to the whole public administration. The 2020 digital governance strategy is the primary statement of the state's own estate: the data centre and government network from 2008 and the government fibre backbone begun in 2017 (strategy). The draft cybersecurity strategy records that both were built with international cooperation and names dependence on external hosting of data and structuring services, including citizens' personal information and critical infrastructure, as an aggravating factor (cybersecurity strategy). The identity institute offers national hosting to the public administration and invites private bodies to use it (hosting). No capacity figure, tier rating, uptime record or customer count is published for any of it.	NO CHANGE
Senegal	A sovereign cloud built with a Chinese vendor is in testing with equipment installed and verified, while a memorandum with a hyperscaler signed in October 2024 has produced no build. The minister states the Chinese-partner infrastructure is deployed and tested, equipment installed and verified. No contract, value, hosting-term, exit or data-access terms are reported (cloud, sovereignty). The hyperscaler memorandum was signed in October 2024 and no build, siting, capacity or spend was reported in the twelve months to August 2026. The repository does not establish how the two arrangements relate (memorandum). A hyperscaler's edge zone, the first in West Africa, launched inside the incumbent operator's data centre on 24 April 2025, a year after the partnership was announced; it is the residency substitute for a country with no full cloud region. 2026-09-29 - the interior minister told deputies a national data centre is being developed for civil-status, identity-card and passport data; no site, cost or date is given.	MIXED one sovereign-cloud partner reported as deployed and tested while another signed two years earlier has produced no build

COUNTRY	DEVELOPMENTS	PROGRESS
Seychelles	The first Tier IV certified data centre was inaugurated in November 2024 and certified in September 2025, beside an existing Tier III facility. The certifying body's record names Cable and Wireless (Seychelles) Limited as client and Data Center 1 at Bon Espoir, Anse Boileau, as the certified facility, with a Tier IV construction and design award issued on 4 September 2025 and valid to 2027 (certification). Cable and Wireless Seychelles inaugurated the facility on 15 November 2024 (inauguration). In March 2026 the operator described it as the country's first Tier IV data centre, positioned to keep government services and financial institutions onshore rather than dependent on overseas facilities (announcement). No floor area, rack count, power capacity or customer list is published for either facility.	MOVEMENT
Sierra Leone	The €23 million operator data centre at Bo was commissioned in December 2025, the country's second such facility. The commercial side of the estate doubled in the window. The ministry reports that the president opened a €23 million operator data centre at Bo, the country's second facility of its kind, working alongside the main Freetown centre and expanding digital and financial services to Makeni, Kono and Kenema while balancing network traffic; figures for it were reported separately. On the state side the national data centre was commissioned in April 2026 inside the telecommunications regulator's new headquarters, and the civil registration authority runs a tier-three facility. No power or tier figure is published for either of the two operator facilities.	MOVEMENT
Somalia	Two new facilities broke ground — a government data centre in Hargeisa and a commercial site near Garowe — beside an operator estate of 11 centres and 10MW. The only quantified national-provider figure the repository holds is an operator's own: 11 data centres with a combined 10MW capacity, many running up to 95 per cent on solar during the day (report). Groundbreaking for Somaliland's first government data centre and cybersecurity management centre took place in Hargeisa in September 2025 with external technical-mission support (ceremony). A commercial operator facility near Garowe was under active construction in January 2026, documented by an engineer on the site rather than by a corporate release (documentation).	MOVEMENT
South Africa	A domestically headquartered operator acquired seven facilities from a foreign one, and a domestic fund took joint control of a second operator's South African data centres. 2025-12-31 — an African operator completed its acquisition of seven facilities from a foreign operator after competition approval, taking its total capacity above 25 MW. It is a transfer of existing capacity rather than new build — the megawatts changed owner, not the country's total — and no per-site capacity, tenancy or price figure is published. 2026-02-04 — the competition tribunal cleared a domestic asset manager's infrastructure fund to take joint control of Africa Data Centres' South African business, with a path to sole control; the parent describes the stake as a minority one, sold as part of reducing its telecoms subsidiary's debt. The state's own capacity is two national data centres run by the state IT agency at Centurion and Beta, both National Key Points. No capacity figure is published for them, and the larger national government data centre proposed in February 2026 has no budget stated.	MOVEMENT
South Sudan	One nationally owned facility: a Tier 2 data centre at Hai Malakal in Juba, commissioned in 2019. A South Sudanese-owned operator runs the centre, offering colocation, hosting, data management, backup and replication (operator). No capacity figure, rack count, power rating or customer list is published, and the company's own page carries no date - the position is as retrieved on 29 August 2026. It is the only nationally owned facility in the repository.	NO CHANGE
Sudan	Two facilities came back into service: the 1,300 square metre state data centre in Khartoum and the incumbent's core data centre in Port Sudan. The minister announced in October 2025 that the 1,300 square metre state data centre had been rehabilitated and returned to service with cloud computing, data security and artificial-intelligence support, qualifying it to host government systems (announcement, report). The incumbent operator, having lost its Tier-4 data centre, three data transformers and a satellite station at a cost it puts above USD 70 million, restored its core data centre in Port Sudan and reports it fully operational for government and private users (account). The central bank separately commits to an expanded data-centre network and a disaster-recovery centre (plan).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Tanzania	Three public data centres were commissioned between March 2021 and December 2025 with no rack, floor-space or power capacity published, and national centres at two sites are named as active investment. No rack, floor-space or power capacity is published for any of the four, so the state's own estate cannot be sized (commissioned). The two national centres are named as active government investment with no commissioning date, capacity or completion percentage held for either (centres, allocation, budget). A national artificial-intelligence data centre is stated by the minister to be under construction, and the power claim attached to it is the one sovereignty argument in this unit with a physical constraint behind it (AI centre). 2017-01-18 - the state operator's US$93.6m tier-three centre at Kijitonyama, completed in 2016, was barely occupied, and the minister told public agencies to stop building their own server space and move in. No later occupancy figure is tied to the site. 2026-10-03 - Zanzibar's communications minister said more than TZS 53bn is set aside for a data centre and public internet.	MOVEMENT
Togo	A sovereign private cloud is being deployed at the national data centre under a partnership between the state operator and a pan-African group. The partnership was signed in June 2026 and no launch date, capacity or price is published (cloud, group). No source relates it to the separate facility the same group had announced building in the country, so whether this is one project or two is unestablished. Management of the state facility was delegated to a private operator for five years at commissioning in 2021, and in July 2023 the minister said the centre was seeking an investor-operator, after a December 2022 decision to hand it to a private partner. No award is on record.	MOVEMENT
Tunisia	The health ministry confirmed an intention to adopt domestic cloud solutions for national health data. The confirmation came in February 2026 (intention). The dataset it would host is the linked health record, for which no legal basis is held. A prime ministerial circular of 2 September 2026 requires public bodies' websites and service platforms to be hosted only at the national computing centre, sectoral public centres or licensed operators, and bans circulating administrative documents over mobile applications and social media. The circular text is not held, and no compliance deadline, exemption route or migration plan is stated. The state's own data centre carries the major government applications on about fifty servers for some 4,500 workstations (hosting). The state operator described in 2018 a primary data centre at Carthage of 200 racks on 2 x 2 MW, a secondary site at Kasbah and a recovery site at Kairouan, and had the Carthage site certified to ISO 27001, 27701 and 9001 in June 2025. No later capacity, power or availability figure is published for either. 2026-09-29 - the health minister named a Tunisian sovereign cloud as the host for every citizen's health identifier and digital record, targeted before the end of 2026; no provider, operator, capacity or amount is named.	MOVEMENT
Uganda	A domestic sovereign cloud launched at a commercial facility, and a national artificial-intelligence research cloud launched at the national university framed as replacing foreign cloud on sovereignty grounds. 2026-10-10 — a third national data centre, cut from the World Bank project in 2025, is provided for in the authority's strategic plan to FY2029/30, on a former regulator's account; no financing or timetable is stated. The sovereign cloud is domestically owned and the building is a commercial operator's (cloud). The research cloud launched in March 2026 with the national research and education network, framed as replacing foreign cloud on data-sovereignty grounds (research cloud). Neither publishes capacity, tenancy or utilisation. Sovereignty framing applied to a service running in someone else's building is the distinction worth keeping. The state's own pipeline narrowed before the window: a third national data centre was removed from the World Bank digital acceleration project in its June 2025 restructuring, leaving an upgrade of existing capacity.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Zambia	A memorandum to co-invest in a national artificial-intelligence data centre, and a national operator partnering on next-generation cloud. A parliamentary committee report on ICT infrastructure is the repository's standing account of national data-centre capacity. 2026-05-26 — the state technology institute and a vendor signed a memorandum to co-invest in a national artificial-intelligence data centre, announced at a mobile congress. 2026-07 — a national operator partnered with a cloud provider to deliver next-generation cloud services. Two commitments and no capacity figure: neither states megawatts, racks, tier or a commissioning date, so the repository can record that capacity is being contracted for and not how much.	MOVEMENT
Zimbabwe	The national high-performance computing centre commissioned its second phase in August 2025, built on a CNY 100,000,000 grant of 2017, and no delivered capacity figure is held. Phase two was signed in December 2017 for implementation from 2018 (centre, grant), after a phase-one interest-free loan that ended in 2015 (phase one). Both records carry dollar equivalents with no conversion date stated. A university high-performance computer is operating with access quoted in large blocks rather than pay-as-you-go, developer-reported through one outlet rather than by the institution (university). No delivered teraflop figure is published for either phase. 2025-08 - the President commissioned phase two at the University of Zimbabwe, with 10 and 100 Gbps fibre links; the centre hosts the health ministry's electronic health records and telemedicine platform and is integrated with the civil registry (commissioning).	MOVEMENT

Off-site backup capacity

COUNTRY	DEVELOPMENTS	PROGRESS
Algeria	Both national data centres, Mohammadia and Blida, hold Tier III Design certification and run in active-active architecture. 2026-02-22 - the first national data centre, at Mohammadia, obtained a Tier III Design classification. 2026-07 - the national digital services centre opened on two data centres in Algiers and Blida in active-active architecture, either able to keep services running if the other fails, and on 2 September the commission recorded Tier III Design certification for Blida, while still working towards certification of the constructed facilities. That is a second site carrying the same workload. No replication arrangement, recovery objective or tested restore is published for either.	MOVEMENT a second site certified; no recovery objective or tested restore is published
Angola	A backup and cloud centre of 48 racks was reported for government in August 2026, with the satellite operator supplying data-centre redundancy. Backup moved from absent to named in this window. A government backup and cloud centre of 48 racks was reported in August 2026, alongside requalification of an existing facility, and the national satellite programme supplies redundancy for the national data centre. It sits on an estate that already had two poles: the national cloud across two government data centres and the centre inaugurated in April 2026. Commercially there is a second operator building capacity. No recovery-time objective, restore test or retention rule is published for any of it.	MOVEMENT
Benin	Off-site backup is provided for in the appraisal of the second regional digital integration project. No operating off-site backup is recorded. 2026-02-16 — the project appraisal document for the second regional digital integration operation provides for this layer. Nothing on this ledger records an off-site backup in operation, a second site holding a copy of state data, or a recovery objective for either. The movement is an appraisal, not a capability.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Botswana	Two Tier III facilities now sell disaster recovery, the state's Digital Delta and Mascom's Innovation Centre. 2019-10 — the regulator's business continuity and disaster recovery guidelines require licensed communications operators to hold backup and recovery plans. 2025-11-25 — the government launched the Tier III Digital Delta Data Centre for hosting, recovery and backup workloads. 2026-07-13 — Mascom repositioned its Tier III centre, built for its own workloads, to sell colocation, cloud, infrastructure-as-a-service and disaster recovery externally. No capacity figure, utilisation figure or government backup policy is held.	MOVEMENT
Burkina Faso	The distributed baseline was about ten mini data centres and eight cloud nodes at roughly 440 TB, 13 TB of memory and 4,900 CPUs; the state estate is now about 3,000 terabytes across two national centres. The agency's own account of the pre-2026 position is about ten mutualised or sectoral mini data centres and eight distributed cloud nodes totalling roughly 440 terabytes of storage, 13 terabytes of memory and 4,900 processors, running 492 virtual machines. That distribution is what off-site resilience rested on. 2026-01 - the replacement is about 3,000 terabytes combined, ten times the prior capacity, with more than 7,000 virtual machines at 100 to 300 per ministry, at FCFA 16bn and run by national teams, in two centres at one city. Private capacity arrived alongside: a scalable modular data centre of 10 to 40 racks at 5 to 8 kW a rack was delivered to Ouagadougou by road from a Ghanaian port in August 2025. No backup, replication or recovery arrangement between any two of these is stated, so capacity is held and off-site backup is not established.	MOVEMENT
Burundi	The central bank maintains a physically separate alternative site, and the state technology body is procuring virtualisation and backup equipment. 2025-11-19 — the central bank issued an international tender for maintenance works on its alternative site, financed from its own funds. It is the clearest evidence that a physically separate secondary site for continuity of critical systems exists and is being maintained rather than left dormant; the notice covers building works and states no IT capacity, rack count or replication arrangement. 2026-04 — a re-issued tender sought additional equipment and licences for virtualisation and backup at the state technology secretariat, the body hosting national platforms. Backup capacity for the government estate is therefore at procurement stage while the central bank's own is in service — the two ends of the same question, several years apart.	MOVEMENT
Cameroon	One public body put a two-site virtual infrastructure and recovery upgrade to tender in December 2025; ministries otherwise host inside the state operator's single facility. 2025-12-19 - the state debt recovery company opened an upgrade of its virtual infrastructure and standardisation of its data centre across sites at Yaounde and Douala, buying virtualisation and live-recovery licences at both, spare disks and power and cabling components, at an estimated FCFA 40,000,000 including tax. It is the only two-site recovery arrangement the repository holds for any public body, and it is at tender rather than in service. The prevailing pattern is single-site hosting with the state operator. A convention of 13 June 2022 puts the public service ministry's server in the operator's data centre with 50 Mbit/s to central services and 4 Mbit/s to deconcentrated services, and in January 2026 the examination board agreed to host national examination data in the same facility, which is tier-certified and tourable. No replication, backup or recovery arrangement between that facility and any other is stated, and no national consolidation policy exists.	MOVEMENT
Cape Verde	A disaster-recovery data centre on São Vicente, built as the mirror of the Praia facility, opened with the Mindelo campus in May 2025. The impact study for the technology park's second phase describes the São Vicente data centre as a disaster-recovery site that also houses a small incubation centre (impact study). Its IT equipment went to tender under African Development Bank financing, with bids closing on 23 October 2024 (tender). In May 2025 the park's chair described it as the mirror of the Praia data centre, sited on another island to meet the recommendation that a backup site sit at least 75 km from the primary (interview). No replication schedule, recovery objective or list of the systems backed up there is published.	NO CHANGE a standing position the repository holds for the first time

COUNTRY	DEVELOPMENTS	PROGRESS
Central African Republic	With no operating data centre, there is no second site. Both proposed facilities are planned or dormant. This indicator asks about a second copy, and the repository does not yet hold a first. The state's tier-three data centre is planned, the commercial memorandum behind the other proposal is dormant, and the regional programme that might supply capacity is in development. Nothing published describes where the systems now running — the payroll and human resources system, the tax and customs platforms — are hosted, backed up or restorable from. The question has not been put in any document on the repository.	NO CHANGE
Chad	One facility, not yet certified or in official operation. No second site or replication arrangement is described. The country's storage estate is a single building that has not entered service: a national data centre built but not yet audited, certified or officially operating, with work to finish and secure it explored with a foreign firm in July 2026. Nothing names a second site, a replication arrangement, a recovery objective or a restore test. The one hundred planned government micro data centres would distribute hosting rather than duplicate it, and none is reported built. Backup capacity here is not partially held; it is unaddressed.	NO CHANGE
Congo	The national data centre was visited by the minister with archives in view, while its contractor threatened to abandon the site. 2025-09-13 — the minister visited the national data centre, with state archives among the purposes named. 2025-10-16 — the contractor threatened to abandon the works. No second site holding a copy of state data, and no recovery objective for any system, is recorded. The primary facility is itself unfinished, which is the more immediate finding.	MOVEMENT
Cote d'Ivoire	The budget ministry's directorates copy their data to a shared backup data centre at Yamoussoukro, open since July 2021. 2021-07-26 - the budget ministry opened a shared disaster-recovery data centre in the Yamoussoukro regional tax office, so that customs, tax and budget data held in Abidjan is replicated at a site outside the city. No capacity, operator, recovery-time objective or restore test is published for it, and no equivalent arrangement is held for any other ministry or for the national data centre under construction.	NO CHANGE
Djibouti	No backup arrangement for the payment system or for state systems generally is held; a central government data centre is in operation (2024). The World Bank project that set out to establish an automated national payment system closed on 30 June 2021; no back-up arrangement for that system is held. Nothing dated inside the period changes it. The central government data centre is in operation (2024), and no continuity plan, replication arrangement or recovery objective for state systems generally appears on file. The terrestrial fibre corridor agreed in February 2026 improves route diversity, which is capacity for backup rather than backup itself.	NO CHANGE
DR Congo	No separate government recovery site is evidenced; the state data centre at about 400 kVA is the only facility, and a health data centre with a backup site went to expressions of interest in June 2026. The government's own account of the state facility gives its capacity at about 400 kVA and records that the law requires all public-administration data to be hosted there while some data still sits on private servers. No operational, geographically separate government backup or disaster-recovery site is evidenced anywhere in the record. 2026-06-16 - the health digital agency opened an expression-of-interest notice for a national health data centre built as a public-private partnership, specifying a main site in the capital plus a backup site, 99.9 per cent availability and a redundant architecture, closing 12 July 2026. It is the clearest movement toward off-site backup anywhere in the public estate and it is at procurement. The commercial market is further ahead than the state: a carrier-neutral facility in the capital is tier-certified at 400 racks over 1,542 square metres and 1.5 MW, and the sovereign government cloud has no hosting location, operator, procurement or date.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Egypt	The government cloud centre is described as an active alternative to the new capital data centre; no replication is stated. The government data and cloud computing centre was inaugurated in April 2024 and described as an active alternative to the new capital data centre and as a unified national platform. A trade account names it the centralised national data and disaster-recovery centre, on the Ain Sokhna road with 10,000 of 23,500 sqm in use. Two sites described as alternatives to each other is the closest thing to off-site capacity the repository holds. What is not stated anywhere is what is replicated between them, on what schedule, to what recovery objective, or whether a restore has been tested. 2026-03-26 - the electricity and communications ministers agreed a joint task force to draw up a national data-centre strategy covering investment incentives, licensing, land and energy.	NO CHANGE a first stated position with no earlier account behind it
Equatorial Guinea	Backup data centre works are tendered but unlet: the server room tender was extended a third time to 16 September 2026. A development bank-financed project tendered technical oversight of new data centre works, including a backup site to an international facility standard, in June 2026. The procurement has not closed: the finance ministry's server room tender was extended for a third time to 16 September and remains unawarded. The primary facility it would back up was stood up under the administration computerisation programme.	STALLED
Eritrea	The only published recovery commitment is the state operator's: a six-day recovery objective on a 90 per cent uptime service level. No government backup arrangement is published for any system, and no second site is named for any of them. The one figure the repository can offer comes from the commercial side: the state operator's private cloud states a 90 per cent uptime service level and a recovery-time objective of up to six days. That is the measure of what recovery means in this market. A six-day objective is what a subscriber is promised by the country's only provider, and nothing suggests the systems the government runs itself are held to anything better. Whether the customs, tax or health systems have off-site copies at all is not stated anywhere on the repository.	NO CHANGE
Eswatini	Government has applied to cancel the undrawn US$10.4 million India Exim loan for the disaster recovery site, the project having failed to proceed. The 2021 budget speech records construction begun on a disaster recovery site at KaLanga in the Lubombo region, with E58 million allocated (speech), financed by a US$10.4 million India Exim Bank line of credit. In October 2025 the communications regulator advertised a tender for consultancy on a disaster recovery facility (tender). 2026-09-22 — the finance minister told Parliament the project had stalled, the loan was never drawn and Treasury had written to the lender to cancel it; he said a functional primary data centre must come first. Beneath it, 9 of 21 ministries keep no regular backups at all. 2026-10-05 - the finance ministry said the loan has not been cancelled, only the commitment fees on its undrawn balance, with 1% disbursed.	REGRESSED
Ethiopia	Off-site capacity grew with a new private cloud platform and Tier III expansion, while the government's own assessed absence of a continuity plan stands (assessment). Wingu Cloud Exchange launched in March 2026, a locally hosted private cloud platform offering compute, storage, container management and security, expanding in-country off-site storage and data-residency options (launch). Ethio telecom's annual performance report for the year to June 2026 reports network and data-centre capacity expansion under its 2028 strategy, including Tier III facilities (annual report); the capacity figures are not in the captured text. The government's own 2023 assessment found neither a business continuity plan nor a disaster recovery plan in place and recommended a framework with prioritised recovery sites (assessment). Nothing since states that such a plan was adopted, so capacity has grown and the obligation to use it has not been created.	MOVEMENT on commercial capacity rather than on any government continuity plan

COUNTRY	DEVELOPMENTS	PROGRESS
Gabon	The first national and sovereign data centre was inaugurated on 3 July 2026. No geographically separate backup site or tested recovery plan is evidenced. The presidency's own record of the inauguration is the most authoritative current evidence of in-country hosting capacity for public data. It establishes the facility rather than an announcement of it, and it does not establish a geographically separate off-site backup site or a tested government disaster-recovery plan. The facility is in service at 92 racks over 3,000 square metres and 1 MW installed, at XAF 8bn, connected to two submarine cable systems, supplied in part by a photovoltaic plant covering about 22 per cent of site energy, with water-free cooling and a dual 15 kV feed with redundant units. A second facility is under construction, 160 racks and over 1 MW due end-November to early-December 2026, which is the first thing on the record that could become a second site. Nothing states that it will be one.	MOVEMENT
Ghana	Government cloud storage runs to 1,289 terabytes split between two cities, and a second-city tier IV facility was certified in 2026. A closed project's completion report records a cloud storage system installed with a capacity of 1,289 terabytes, 703 in the capital and 586 in the second city, improving accessibility, efficiency and disaster recovery. It is the clearest documented geographically separated government storage figure the repository holds. 2026-02-24 - a new tier IV data centre in the second city hosting the integrated customs management system secured information-security certification, engineered for high availability, fault tolerance and business continuity. Neither source states how much of the capacity is used, what is replicated to it, or whether any recovery has been tested.	MOVEMENT
Guinea-Bissau	No backup arrangement is described anywhere in the repository for Guinea-Bissau. Nothing in the repository states where any Guinean government system's data is copied to, or whether it is. The documents that would say so are forward-looking: the national cloud scoped in the feasibility study and the data centre named in the 2026 budget. Neither mentions redundancy or a second site.	NO CHANGE
Kenya	The national disaster recovery site is in dispute, a court award growing at 12 per cent a year with no settlement plan. The Auditor-General records that a court award of Kshs 4,099,636,848 made in December 2022 over Phase III of the national disaster recovery site stood at Kshs 4,091,619,712 outstanding on 30 June 2025 after part payment, interest accruing at 12 per cent a year, with no settlement roadmap provided to the audit (report). Commercial capacity grew in the same period: an operator cloud launched inside a Nairobi data centre in September 2025 (cloud), and a 44MW facility broke ground at Tatu City (groundbreaking). The state's own recovery site is the half in dispute.	REGRESSED
Lesotho	A business-continuity and hosting contract was awarded in September 2025, while the backup data centre at Mohale's Hoek has no record of going live. The Mohale's Hoek facility was toured near-complete by the communications minister in May 2018, awaiting its power station, and designed as a backup 100km from the finance ministry's Maseru data centre; in October 2021 a contract was awarded to bring it into operation and to integrate the three government data centres. No source confirms it going live. 2025-09-26 - the finance ministry awarded a three-year LSL 35.6m contract to replace end-of-life government data-hosting equipment and build a business-continuity framework for the public sector, financed by the World Bank's concessional arm. No recovery objective or second-site arrangement under it is published.	MIXED a business-continuity contract was awarded while the backup data centre toured near-complete in 2018 has no record of going live

COUNTRY	DEVELOPMENTS	PROGRESS
Liberia	The central bank's 2026 statement undertakes minimum uptime, disaster-recovery and continuity standards for payment participants. The policy statement commits the bank to establishing minimum uptime, disaster recovery and business continuity standards for payment participants and to requiring regular cybersecurity and operational resilience testing, alongside prefunding and settlement risk controls. It is the clearest regulatory step on continuity the repository holds for banks, mobile money and the national switch. Against that, the supreme audit institution's own 2026-2030 plan records its information technology infrastructure as fragile, with gaps in servers, networks, backup systems and cybersecurity — a dated self-reported backup deficit at the body that audits everyone else.	MOVEMENT
Libya	No backup rule or disaster recovery site is held; the central bank said in July 2026 that banking systems were fully restored after a cyberattack. The one recorded test of resilience came out well: the central bank told the parliamentary finance committee in July 2026 that banking systems were fully restored after a cyberattack with no accounts hit. The repository holds no rule on where backup copies are kept and no named Libyan disaster recovery site.	NO CHANGE
Madagascar	One commercial provider replicates hosted servers offshore hourly; no government off-site backup arrangement is held. A commercial service page captured in August 2026 describes hourly backup of Madagascar-hosted servers to a Tier IV facility in another African or European country, with automated failover and recovery under two hours (service). The government data-centre programme tendered infrastructure equipment for a primary and a secondary site in February 2026 (tender). The two sites are the state's own resilience arrangement as far as the repository records it. No off-site or out-of-country backup policy for state data, and no continuity requirement, is held.	NO CHANGE a standing commercial service with no earlier position held
Malawi	A new 120-rack commercial data centre launched in Lilongwe, adding in-country capacity beside the government facility. The government's own architecture is specified rather than measured: the environmental plan for the national data centre sets a primary site with a disaster-recovery site behind it, and the revenue authority runs a secondary data centre of its own. 2026-05 - a private operator launched a 120-rack data centre in Lilongwe, offering in-country secure hosting and storage as an alternative to offshore. It is the only capacity figure in racks the repository holds for any Malawian facility, and it belongs to a commercial operator rather than to the state. No utilisation, retention policy or recovery-time objective is published for any of the three.	MOVEMENT
Mali	One facility and no second site. The tier-three centre states an availability standard and no replication arrangement. A single data centre cannot answer this indicator, and a single data centre is what the country has. The tier-three facility inaugurated on 31 January 2026 states an availability standard of 99.982 per cent — a statement about that building's own redundancy, not about copies held elsewhere. Nothing published names a second site, a replication arrangement, a recovery-time objective or a restore test, for that centre or for any government system that will move onto it. The announced repatriation of public data held abroad would concentrate rather than distribute what the state holds, which makes the absence of a second site the more consequential.	NO CHANGE
Mauritania	One data centre and a backup station specified back in 2021. No second operating site is reported. The estate is one facility: the tier-three data centre of 1,372 square metres and 100 racks, inaugurated in May 2025, now carrying the national cloud. A backup site was specified long before it. The regional connectivity programme's tender documents of February 2021 carry station specifications for a backup data centre, and nothing since reports one built or operating. What the window does record is oversight of the primary site: the data-protection authority's June 2026 meeting took up hosting and the data centre's certification. No recovery objective or restore test is published.	NO CHANGE

COUNTRY	DEVELOPMENTS	PROGRESS
Mauritius	A central backup service runs for government, and a disaster recovery site is inside the current server and storage procurement. The central information systems division operates a central backup service for government (service). High-performance servers, a storage area network and a backup solution for the main site and the disaster recovery site reached bid evaluation (evaluation), and a scale-out storage solution was awarded in March 2026 (award). The service page publishes no capacity, retention period or restoration-test record, and nothing states whether the disaster recovery site is in service.	MOVEMENT
Morocco	Two institutions tendered recovery platforms in 2026: 108TB scalable past 10PB and a MAD 5m tier three site. The pension fund tendered an anti-ransomware backup platform with 108TB of immediate capacity scalable beyond 10PB in May 2026, and the finance ministry tendered a MAD 5m tier three disaster-recovery platform sited more than 100km from the capital in June. Both are procurements rather than facilities in service, and both are institution-specific: no whole-of-government recovery arrangement appears in the repository.	MOVEMENT
Mozambique	Two in-country availability zones about 20km apart were launched, under 2025 decrees setting redundancy, continuity and data-location requirements. 2026-07-24 — a commercial provider launched two geographically separate in-country availability zones about 20km apart, allowing disaster-recovery and high-availability architectures with data kept resident in the country. No capacity figure is disclosed. 2026-07-24 — a public tender was issued for an uninterruptible power supply battery facility at the state financial system agency's secondary data centre, a dated public investment in a named government secondary facility's resilience. The rules were made first: two decrees approved on 31 December 2025 establish redundancy, continuity, licensing and data-location requirements for data centres and cloud computing. No national figure for backup capacity, and no count of systems with off-site recovery, is published.	MOVEMENT
Namibia	No government off-site backup exists. A national data centre is funded as a 2026/27 flagship, and one operator sells backup and recovery commercially. The 2022 task force report found the country had no national data centre and recommended establishing one (report). Four years on it is one of the ICT ministry's flagship projects for 2026/27 inside a N$639.2 million budget, with no site, capacity, cost or completion date published (budget). Commercially, an operator advertises backup and disaster recovery as a service with replication into its own data centre, drawing the distinction between holding a copy and being able to resume operations (service). Two commercial facilities operate, one run by an operator and one by an aerospace company. What is not on the repository is any statement of where government data is backed up, or whether it is.	MOVEMENT
Niger	No second site and no backup arrangement is published. The national data centre is the only facility on the repository. The country's storage estate on this repository is one facility: the national data centre, specified at the third tier, tendered in February 2026 and described as near complete in June. Nothing published names a second site, a replication arrangement, a recovery-time objective or a restore test, for that centre or for any government system that would use it. Tier specification speaks to a facility's own redundancy and says nothing about copies held elsewhere, so the repository holds no evidence of off-site backup capacity in either direction.	NO CHANGE
Nigeria	A Lagos cloud region gives one platform three separate legal jurisdictions, an edge facility opened in January 2026, and the state carrier runs a Tier IV disaster-recovery centre in Kano. The Lagos region is a full compute region in a carrier-neutral facility, the third alongside two others, framed around data residency since the data protection Act took effect and giving three separate legal jurisdictions across the platform (region). An edge facility entered service in January 2026 (edge). The state carrier's Kano disaster-recovery centre, completed in 2022 with about 2.2 PB of storage, backs up its Abuja shared-services centre, and its second phase, built from 17 prefabricated modules, holds Tier IV design and facility certification. No replication rule or backup requirement for government systems is published in this repository.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Rwanda	Government backup is mandated at the national data centre across four recovery tiers; commercially, a tier III licence took effect in April 2026. The current implementation guidelines set government-wide hardware, software, hosting and disaster-recovery requirements and mandate off-site backup at the national data centre, across bronze, silver, gold and platinum recovery tiers (guidelines). A fifteen-year tier III data centre licence effective 1 April 2026 covers cloud hosting, storage, disaster recovery and backup infrastructure (licence). A cross-border memorandum signed in May would co-invest in a second such facility, with no sum stated for either party (memorandum).	MOVEMENT
Sao Tome and Principe	The draft cybersecurity strategy describes no backup or disaster-recovery capability; a disaster recovery arrangement was tendered alongside the identity data centre in May 2026. The strategy sets objectives on the resilience of critical infrastructures and on incident response plans and a national response team, and describes no backup or disaster-recovery capability anywhere in the state estate (strategy). The procurement agency tendered servers and a disaster recovery arrangement for the identity data centre in May 2026 (tender). The tender's own body is an attached document that has not been read, so scope, value and specification are unstated, and no award is confirmed. It is the only redundancy design named anywhere in this ledger, and it covers one system rather than the estate the strategy describes as dependent on external hosting.	MOVEMENT
Senegal	The critical infrastructure bill imposes data backup and continuity obligations, while none of the three state data centres is designated a backup for the others. The bill was adopted in plenary on 20 August 2026 by 127 votes to none, its structuring obligations naming data backup and the putting in place of continuity and recovery arrangements alongside risk analysis, encryption, audits, homologation and incident notification. It states no commencement date, no implementing decree and no list of designated critical infrastructures: the obligation is created, the capacity is not evidenced. One agency has written the requirement into a binding procurement: bidders must guarantee data localisation in Senegal, manage backups with tested restoration procedures, hold redundant Tier 3 data centres in Senegal, assure real-time replication and name a replication site in Senegal, under signed availability service levels — a stated requirement covering one agency, not an award or an operating facility. The state's own estate designates nothing: three data centres of 32 TB at 81% used, 392 TB at 93% used and 1,000 TB at 31% used, none named as a secondary, mirrored or disaster-recovery facility for the others.	MIXED a statutory backup obligation was enacted and one agency bought disaster recovery while the state estate designates no secondary site
Seychelles	A Tier III data centre at Perseverance offers colocation and customer disaster recovery — the only off-site backup capacity the repository records. The facility is described by its operator as carrying redundant power and cooling and serving customer disaster-recovery planning with round-the-clock monitoring (data centre). A second facility, at Bon Espoir, Anse Boileau, was inaugurated in November 2024 (inauguration) and presented by its operator in March 2026 as the country's first Tier IV data centre, keeping government and financial-institution systems onshore (Tier IV). Nothing held states where government data is actually backed up, whether any ministry holds an off-site copy, or what recovery objectives apply.	NO CHANGE
Sierra Leone	The Bo facility is the operator's national disaster recovery hub, working alongside the Freetown centre to keep systems running through outages and faults. For the first time the repository can name a second site with a stated recovery purpose. The ministry's account of the Bo commissioning describes it as the operator's national disaster recovery hub and the country's second facility of its kind, working alongside the main Freetown centre to ensure essential systems remain operational during power outages, natural disruptions or technical faults. That is a commercial arrangement. On the government side the national data centre commissioned in April 2026 and the registration authority's own facility are named without any statement of replication between them, and no recovery-time objective or restore test is published for any of the three. The finance ministry's data centre, which hosts the electronic procurement platform, had no comprehensive disaster-recovery system in January 2026; officials said plans were under way and the project places recovery in its second phase (inspection).	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Somalia	The only documented off-site arrangement is a provider's commercial disaster-recovery service offering offshore backup in Mombasa and Mogadishu. A national telecommunications and internet infrastructure provider advertises offshore backup in Mombasa and Mogadishu, real-time replication, continuous data protection, business-continuity planning and server imaging as part of a standing service portfolio (service). No storage-capacity figure is published, and no customer is named. Nothing states where government systems are backed up. The national data centre remains in development (centre) and the hosting and cloud guidelines that would set a rule are still planned.	NO CHANGE
South Africa	A development bank invited a five-year managed disaster-recovery service, and a second institution put out a server and storage upgrade. 2026-01-31 — a five-year managed service was invited for backup, restore, disaster recovery, replication and business continuity, and 2025-03-10 — a second development finance institution invited proposals to upgrade its server and storage infrastructure. Both are procurement notices. They establish an intention to buy resilience rather than a capability in service, and neither has an award, value or completion on file. That is the whole of the country's off-site backup record. No government-wide backup standard, no recovery-time objective and no continuity test appears anywhere on this ledger — against a state that lost a statistical series for five years to a cyber incident, reported under administrative statistics.	MOVEMENT on a procurement notice rather than a capability
South Sudan	A redundant site for the financial management system was contracted and fully paid at US$1,338,685 and was not confirmed functional at audit. The Auditor General's December 2025 finding records a redundant site of equal configuration to the primary micro data centre, contracted and fully paid at US$1,338,685, not confirmed functional at the date of audit and not verified for environmental or safety compliance, with management stating implementation was still in progress (audit). This is the only off-site backup arrangement named anywhere in the repository, and it is the government's own auditor who reports it unfinished. No backup arrangement is published for any other national system.	STALLED
Sudan	The vehicle register survived the war on backup data centres built inside the states and abroad, restored at 2,124,750 vehicles and 3,161,599 driving licences. The traffic police register was restored with 2,124,750 registered vehicles and 3,161,599 driving licences, and the offsite and in-state backups are credited with its survival (register). It is the only evidence in this unit that any government system was designed to survive the loss of its primary site, and it is the only registry the repository can say came through intact. No comparable arrangement is recorded for the identity credential, the civil-service records system or the national platform.	MOVEMENT
Tanzania	Off-site backup has been required of government since 2017, and a domestic private cloud launched in November 2025. The 2017 security architecture standard requires a three-tier backup strategy — daily, weekly and monthly — and an off-site data-storage facility, under the systems continuity domain of the ten government security domains. Central bank guidelines of August 2025 bar mission-critical financial-sector data from being hosted outside the country and require cloud contracts to cover infrastructure redundancy and backup arrangements. A locally hosted private cloud with storage and security services launched in November 2025 as a domestic alternative to offshore providers, able to support resident backup and disaster recovery. No tested-recovery statement, capacity figure or compliance count against the 2017 standard is published.	MOVEMENT

COUNTRY	DEVELOPMENTS	PROGRESS
Togo	Commercial colocation opened in October 2025 and the telecoms regulator tendered a backup link to the national data centre in June 2026. The colocation offering launched on 15 October 2025 lets Togolese organisations place their own servers in a third-tier facility with redundant power, round-the-clock supervised access, biometric control and precision cooling — the practical route to off-site copies in country. It is a vendor announcement; the facility is not named and no backup or replication service level is stated. The telecoms regulator issued a procurement notice on 12 June 2026 for transmission equipment and a point-to-point backup link between its headquarters and the national data centre, estimated at 30,000,000 FCFA with a 90-day delivery period and bids due 10 July. That is the clearest dated step by a Togolese state body towards off-site redundancy, and it is a tender rather than a commissioning.	MOVEMENT
Tunisia	A private cloud for the state computing centre was contracted in January 2026, alongside a national backup centre running since the 2000s. The state computing centre's national backup centre, initiated in 2006 with World Bank support, is described by its operator as the recovery site for critical state applications, with a standards-compliant data centre, a redundant fibre backbone and round-the-clock on-site security. An African Development Bank-financed contract for a private cloud for that centre was awarded at EUR 8.17 million and TND 1.31 million including tax, on a 24-month build from 2 February 2026. A state bank separately awarded a two-lot tender worth 6.03 million dinars for server and storage extension at both its principal and its backup data centres. No capacity figure, tested recovery time or list of applications covered is published for any of them. A state bank bought 1,500 units of a foreign cloud platform over three years through a nationally certified host, with its data kept on Tunisian territory (tender). It is the first use of the national cloud label the repository holds.	MOVEMENT
Uganda	The National Data Centre lists backup and disaster recovery among its services, and two agencies went to market for their own in June 2026. The central offer is a catalogue rather than a measured capacity: the data centre lists backup-as-a-service and disaster recovery alongside infrastructure as a service for government entities, with no capacity, uptake, recovery-point or recovery-time figure behind any of them. 2026-06 - the registration services bureau invited bids for a cloud disaster recovery and hybrid backup solution through the electronic procurement portal, and a bid opening was recorded for firewall and switching equipment to establish a second active instance of the electronic passport system at the National Data Centre. Both are procurement notices with no award, value or completion on record. What the repository cannot say is how much government data is actually held off site, and no source states it.	MOVEMENT on procurement rather than delivered capacity
Zambia	A procurement notice for servers and a backup platform and a national operator cloud partnership, over a committee finding on disaster-recovery sites. A parliamentary committee review of the state technology institute carries the repository's finding on disaster-recovery sites, alongside the government wide area network rollout. 2025-08 — a national coordinating office issued a procurement notice for servers and an open network automation platform backup solution. 2026-07 — a national operator partnered to deliver cloud services that would carry backup capacity commercially. One agency's procurement and one commercial partnership is what the window holds. No government-wide backup policy, recovery-point objective or tested restoration is on the record.	MOVEMENT
Zimbabwe	A geographically separated disaster recovery site is a stated Treasury priority, and two recovery sites for the procurement system went to tender in March 2026. Treasury's 2027 budget strategy paper sets a three-pronged approach to national ICT infrastructure: upgrading the national data centre to Tier IV standards, establishing a geographically separated disaster recovery site, and expanding the smart government private cloud for consolidation across ministries (strategy paper). No site, cost or timetable is stated. The procurement authority published notice PRAZ/RB/05/2026 on 18 March 2026 for two disaster recovery sites for the national electronic government procurement system, on international competitive bidding funded from its own budget, with contract signing scheduled for 31 March 2026 and an award notice for 4 June 2026 (notice). No award, and no operating off-site backup for any national system, is on the repository.	MOVEMENT
