

MONTHLY UPDATE

Connectivity: monthly update, July 2026

Edition of 2026-08-25 · compiled from the Data Landscapers source base

46 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.

The place reports do not share one window; the period above is the range they span.

Algeria

IPv6 generalisation was [launched on 14 July](#).

On 23 July the Council of Government examined draft executive decrees renewing the public cellular licences held by Mobilis and Optimum Telecom Algérie (Djezzy). Renewal by executive decree places licence continuation with the cabinet rather than with the regulator, which ran the 5G round as a competitive tender. No term, fee, coverage obligation or decree text is held, and the Prime Minister's own communiqué of the sitting is not on file — the account rests on [one press carry](#).

Angola

On 23 July a state-owned telecoms arm [commercially launched an enterprise fifth-generation service in Cabinda at about US\\$20m, with a stated ambition of every provincial capital by 2027](#) — the operator's own figures.

Botswana

The [Plumtree-Bulawayo section of a regional fibre corridor went live on 6 July, carrying traffic at 800Gbps equipped on equipment rated over 10Tbps](#), with a second phase to Livingstone due September 2026. The corridor is stated as a Botswana-Zimbabwe-Zambia route; the live section is inside Zimbabwe and no Botswana segment is dated.

The western corridor did produce a Botswana segment. Alongside the Kasane memorandum the two sides disclosed that [MTC has completed the Gobabis-Buitepos fibre link, now interconnecting with BoFiNet at Charles Hill](#) — described as the first direct cross-border fibre link between the two operators — and costed the Trans-Kalahari Corridor's remaining 4G gaps at about N\$52 million across 13 new sites. The two national incident-response teams are also said to be deepening cooperation. No capacity, commissioning date or traffic figure is published for the fibre link.

Domestic access moved on a much smaller scale. The backbone company [completed its 2025/26 local access projects at P43m, taking fibre to Moshupa, Ramotswa/Taung and Thamaga and connecting 191 customers — 68, 66 and 57 across the three — with 210 construction jobs](#). The customer count is the operator's own and is a count of connections, not of premises passed.

Burkina Faso

At the Prime Minister's mid-year review of 25 July the digital ministry reported 46.7% physical execution of its 2026 objectives contract, the replacement public-administration network's architecture finalised with suppliers' bids under evaluation, and [satellite-operator admission negotiations advancing](#); that operator remains unlicensed.

The regulator ran a four-day workshop with territorial authorities from 29 June to 2 July, naming local opposition and misinformation as continuing brakes on tower rollout. At an address-protocol forum on 3 July the regulator and operators again called for a migration plan with a firm calendar; none is adopted.

The month's one new external route is a proposal rather than a link. Burkinabè and Nigerian digital ministries [met in Ouagadougou on 12 August to explore connecting Nigeria's planned 90,000km open-access fibre backbone into Burkina Faso](#), alongside cooperation on artificial intelligence in local languages, digital public infrastructure, cybersecurity and skills, and [a stated aim of halving internet costs through that backbone](#). No instrument was signed and the Nigerian backbone is itself unbuilt.

Burundi

On 3 August the regulator ARCT [accepted that internet quality is degraded and named the causes](#): recurrent electricity cuts forcing base stations and data centres onto generators the operators struggle to fuel, unstable supply from the utility REGIDESO, bandwidth saturation in urban centres, ageing transmission equipment and simple absence of masts in parts of the country. It said it can apply the sanctions in operators' licence conditions, and named two remedies: a draft law enabling ICT infrastructure sharing and a PAFEN-financed mast-deployment programme. Lumitel and Econet Leo were contacted for that account and did not respond.

On the money side, the universal service fund's [revised FY2026/27 procurement plan carries BIF 11.40bn for dedicated IP transit](#) — 8 Mbit to public health facilities and 10 Mbit to schools — funded from the 1% levy on operator turnover rather than from the general budget.

Cameroon

An account of 27 July put the national fibre backbone at [over 15,000 km](#), against about 12,000 km terrestrial on the 2024 reference year; the two figures are not reconciled to a single primary and may rest on different measurement bases.

The same account records the [2024 customs circular on satellite terminals still operative](#), with kits entering through indirect registration abroad and ten modems seized at one post in December 2025.

Cape Verde

No new connectivity measurement was published in the window, and the regulator's market series still stops at the second quarter of 2025 ([regulator indicators](#)).

The continental frame moved instead. On 24 July 2026 the African Union development agency launched a Programme for African Developing Island Economies at a ministerial segment in Abidjan, covering Cape Verde and six other island states on a 2026-2031 roadmap organised on six pillars including connectivity, with digital public infrastructure and artificial intelligence named as accelerators. No Cape Verde-specific commitment, allocation or project is named in it.

Central African Republic

Subscribers at a northern town reported [no calls, no internet and no mobile money for close to a month, with no restoration date](#). The failure is attributed to off-grid relay sites, equipment theft and repair crews travelling hundreds of kilometres, on a network with one operator and no redundancy; the base held nothing on this locality before.

Comoros

Comores Télécom [revised its retail fibre and mobile offer on 15 July 2026](#), cutting the entry fibre tariff from KMF 32,500 to KMF 30,000 a month while raising the basic allowance from 800 GB to 850 GB and adding unlimited calls to fixed lines. [Director-general Ali Hadji Mmadi also announced eSIM provisioning — KMF 5,000 to migrate an existing SIM, KMF 10,000 for a new one — and two paid value-added SMS services, a pharmacy-on-duty locator and prayer-time notifications](#). The account is the operator's own press event, and its internal dateline is inconsistent: it describes the launch as "yesterday, Monday 15 July," though 15 July 2026 fell on a Wednesday, so the date's precision is flagged uncertain.

The connectivity project the agency carries reached the stage before financing. At a technical meeting on 10 August the [African Development Bank and the Multilateral Cooperation Center for Development Finance told the finance ministry they were ready to fund the feasibility studies as a grant](#), the project covering data-centre studies and inter-island connectivity. No commitment amount, study contract or timetable is stated, so no finance record was built.

Congo

Two positions describe the same weakness from either end. The country has [relied on one submarine cable since 2012, with a switch to another announced as three weeks away after weeks of outages](#) — six months on, no source confirms any new cable carrying traffic. Behind it, [mobile backhaul spectrum fees run at about 5% of operators' total revenue against a sub-Saharan median of 0.5%](#), alongside delayed spectrum assignments and technology-neutrality restrictions. Backhaul is the default rural link where fibre does not reach, so the premium falls hardest where coverage is weakest, and no regulatory response is on file.

Cote d'Ivoire

A low-orbit satellite operator [went live by 17 July](#) at XOF 28,746 a month for residential service, with hardware from XOF 148,148, on a twelve-month provisional licence reviewable on service quality. On 31 July the minister said regional satellite capacity would be routed through the universal-service bodies, with a working session on terms due the following week; no terms, tariff or timetable was stated. No 5G launch occurred against the announced July 2026 date. Ministry figures given on 13 July put telecommunications penetration above 130% of population and [about 38,000 km of optical fibre](#).

On protecting what is already laid, an operator and its vendor [completed a proof of concept in Abidjan that detects vibrations around fibre ducts and classifies them to flag third-party excavation before a cut happens](#), on trials run since 2025. The account is vendor-issued and states no commercial deployment, coverage or date. The cable that carries much of the traffic had already failed and been mended: the [2Africa branch into the country came back into service on 2 August after repairs](#), with WACS repairs expected the week after. Neither the outage's start nor its cause is stated.

Djibouti

On 3 August 2026 the Italian foundation Med-Or reported that a [project promoted by Italy's foreign ministry with Med-Or is building the Djiboutian authorities' capability to inspect and protect the submarine cables](#), under a memorandum with the Ministry of Economy and Finance covering critical infrastructure, digital connectivity and strategic dialogue. [Med-Or's figures put 12 cables landing in Djibouti, six connected to Italy, and about 18% of international submarine cable data transiting the country](#). No amount, term or delivery date is stated and the memorandum is not held.

On 29 July the new communications minister [received Japan's ambassador and the UN resident coordinator in succession](#), covering audiovisual media re-equipment, journalist training against disinformation, and the strategic weight of the cables. No agreement was signed and no figure was given.

DR Congo

Deployment of the transformation project's fibre backbone was reported to the Council on 3 August: [7,000 km laid against more than 18,500 km, leaving 11,500 km outstanding](#) and tied to connecting 145 territories by 2030. The minister attributed the pace to budget constraints and a low disbursement rate on external financing, blamed on donor procedure.

Coverage arrived from orbit before it arrived by fibre. An operator [commercially launched a satellite-to-mobile service on 14 August, the first African operator to take the technology out of testing](#): a compatible LTE Android handset with a clear view of the sky reaches messaging and SMS through satellites where there is no terrestrial network, with no dish, router or other equipment, and the [regulator has confirmed a phased rollout](#). The service is stated as designed for light data, and the only access term published is a [free 30-day trial for customers who register through the operator's app](#); no standing tariff, coverage map or subscriber figure is on the record.

Egypt

An independent measurement published on 3 August 2026 gave the first full-year reading of Egypt's 5G launch. Six months after commercial service began in June 2025, the 5G median download speed had fallen to about 89 Mbps from 110.5 Mbps on launch day, and the combined 4G and 5G median stood at 34.77 Mbps against a pre-launch baseline of 37.68 Mbps ([measurement](#)). Egypt is the only one of the four North African launch markets with no published coverage or quality obligation attached to its award.

Attention has moved to the band above it. The incumbent, the regulator and a Chinese vendor [ran a mobile base station and a data call over upper 6 GHz on 19 August, reported at about 1.7 Gbps per user](#) and stated by the operator as the first such trial in Egypt and in Africa. It is a trial: no allocation, award, licence or commercial date follows it, and the throughput figure is the operator's own.

Equatorial Guinea

GETESA signed a [network contract with Huawei](#) on 9 July 2026 covering the modernisation the operator set out in May – 5G, eSIM, public Wi-Fi and fibre reactivation. The [independent outlet Radio Macuto](#) reported the arrangement on 15 July as a rescue of GETESA alongside the creation of TELGESA, and criticised the procurement as opaque.

At a working session on 22 July with the commission examining state-participation companies, Vice-President Nguema Obiang Mangué [ordered an audit of GECOMSA](#) – its financial position, the value of its assets and liabilities and its outstanding debts – before the definitive merger agreement with Loita Group creating TELGESA is signed.

The Minister of Transport, Posts and New Information and Communication Technologies [signed a temporary Starlink authorisation](#) on 28 July at a ceremony in the Palacio del Pueblo, permitting North American companies to use the service for operations on the high seas within jurisdictional waters, and handed it to the Minister of Hydrocarbons with the oil companies operating in the country present. A negotiating commission meeting the same day [heard that type-approval and the competences of the company and the regulator ORTEL remain undefined](#); a first phase serves public bodies, airport terminals and selected companies, and extension to individual subscribers is conditional on the negotiations concluding, which the executive justifies on security grounds.

The same ministry published [terms of reference for a public tender](#) on 29 July for a full technical diagnostic of existing digital terrestrial television infrastructure and its regularisation, rehabilitation, commissioning and operational transfer. It is Treasury-financed, and no contract value, tender deadline or switchover date is stated.

The ministry put a six-month connectivity plan to the Prime Minister on 15 July. It [names 2G and 4G coverage to 85% through 34 new towers in Annobón and the interior, a Roaming Cero arrangement with Cameroon, Gabon, Chad and the Central African Republic, and a national digital postcode system](#). No budget, contract or delivery date accompanies any of the three, and the consolidated action plan they sit in was adopted on 31 July unfinanced, going first to the interministerial council and then to the Council of Ministers, which decides what is recorded and funded.

Eritrea

[Starlink's coverage-availability map, checked 17 July 2026](#), lists Eritrea among seven African states — Algeria, Djibouti, Egypt, Libya, Morocco, South Africa and Eritrea — with no planned launch date, all but South Africa in the north of the continent or the Horn. No licence application, refusal, or other Eritrea-specific process was found in the source; the position is an absence of an announced date rather than a documented refusal.

Eswatini

ESCCOM [proposed on 20 July 2026, in Notice 08/2026, raising the minimum internet speed from 2 Mbps to 10 Mbps](#), citing demand for high-bandwidth low-latency service. It is a proposal; the 2 Mbps standard stands.

At a workshop for ICT parastatal directors on 22 July, the Ministry of ICT [put mobile coverage at 95% and mobile-internet subscription at 57%](#), blaming data prices and paper-based public services, and set out a target of 859 schools and 134 health facilities to be connected. It named institutional leadership, not technology, as what will decide the outcome.

Free adjudication of consumer complaints against communications providers runs under the Eswatini Communications Commission Act 2013, with windows of one month for post and courier, three for broadcasting and six for telecommunications — a structural provision, not dated state.

Ethiopia

The incumbent closed its financial year with [data and internet at 31.1% of revenue against mobile voice at 23.5%](#) — the first year in which voice was not the largest share — on 215.8bn Birr of revenue and 92.9bn Birr of operating profit, the operator's own unaudited figures. Build-out continued underneath it: a progress review on 10 August put [879 sites completed under one vendor programme and 4G population coverage at 92%](#), a figure scoped to that vendor's own footprint and not reconciled against the 95.5% national coverage claimed for the wider contract set. The second licensee reported [14.7 million ninety-day active customers at 30 June](#), against a target of positive earnings by March 2027.

Gabon

On 27 July the Libreville seminar on space communications closed with eleven recommendations, confirming a hybrid fibre and satellite model on [2,000 km of fibre already deployed](#).

The national internet exchange point opened a reboot workshop at Libreville on 3 August, running to 8 August, with the Internet Society and AFRINIC as technical partners ([opening](#)). It [closed on 8 August with certificates presented after six days of peering, security and sovereignty training](#); AFRINIC called for a network of trained ambassadors to carry the skills into firms and administrations, and operator representatives named broader institutional buy-in as the task that remains. No participant number and no post-relaunch member count has been published.

Ghana

The regulator's [consolidated response of 31 July](#) answered sixty written queries from four prospective applicants, formally amended the request for applications in seven places, and shifted every subsequent date by 21 days, with licence fees now due 17 November. [It refused any extension to the 70% population coverage obligation of 6 March 2027 while confirming that obligation is band- and technology-neutral and can be met in substantial part from existing deployment](#). It also rewrote the dominant operator's rural schedule from licence-relative years into fixed dates of December 2029, 2032 and 2035, expressly so that buying spectrum would not accelerate an equivalent existing commitment. [And it recharacterised the 40% premium on that operator's reserve prices in writing as a price for attributable value rather than a sanction or a market-power remedy, declining to publish its valuation model during a live assignment](#).

Beneath the licensing argument, the traffic that never leaves the country was counted. On 16 August the Accra exchange was reported [past 200 Gbps, against three exchanges that barely overlap: only 4 of 39 connected networks peer at all three, so most local traffic still transits abroad](#). The headline figure is the smaller finding. An exchange is worth the traffic it keeps local, and three partly-overlapping exchanges keep less of it than one would.

Guinea

Facebook, YouTube and TikTok became inaccessible on 28 July 2026. The Association des Blogueurs de Guinée activated its monitoring protocol the same morning, ran connectivity tests through the day through independent monitors in Conakry and the interior, and [concluded that the results converge on a targeted block of those three platforms, arguing the precision of the restriction excludes an ordinary outage](#). It grounded its objection in article 19 of the constitution, article 9 of the African Charter and article 19 of the ICCPR.

The restriction [disrupted business operations and online services](#), and was [still running on 7 August, outside any electoral period or declared crisis](#), with WhatsApp also disrupted and VPN traffic passing.

Kenya

The Communications Authority introduced a [Communications Equipment Distributor licence](#) by public notice on 21 July 2026, mandatory before equipment type approval and customs clearance, with penalties of KSh 1m or three years.

Satellite capacity ran out in the country's densest markets. The operator [suspended new sign-ups across seven counties](#) in early July, diverting orders to a deposit-backed waitlist. On 4 August the second mobile operator said its direct-to-cell pilot had completed and it awaits regulatory approval; the interference audit opened in March has produced no published finding.

Kenya and Tanzania [launched a cross-border terrestrial fibre link](#) on 29 July 2026, integrating the Tanzanian backbone with the Mombasa submarine landings. The London Internet Exchange [added a regional cloud provider to its Nairobi hub](#) in July, reaching 55 or more connected networks on combined traffic of 330 Gbps.

The largest procurement in the window is a surveillance build sold as traffic management. The roads authority is out to tender on [Nairobi's Intelligent Transport System Phase II at Ksh10bn, about US\\$83.8m, covering CCTV, e-police monitoring and vehicle-detection systems at 60 junctions on a 30-month design-build contract financed by a South Korean development loan](#), with the bid deadline pushed back two weeks to 19 August. No data-protection authorisation, retention rule or oversight arrangement for the cameras and detection systems is reported, and no award has been made.

Liberia

The regulator revoked [Starcell International Liberia's universal licence and spectrum authorisation with immediate effect on 22 July 2026](#), after a 90-day suspension from 9 February during which no corrective action was taken; spectrum, numbering resources and regulatory privileges revert to the Authority. The grounds cited were failure to commence operations, unmet financial obligations and non-payment of universal access contributions.

At the same 21 July event, the Posts and Telecommunications Minister [announced a second subsea cable and expanded fibre](#), with no completion date, budget line or cable landing partner given for either; the LTA separately said it is reviewing a World Bank-supported report on reducing telecom costs.

The Anti-Corruption Commission's 30 July complaint over the telecoms traffic-monitoring arrangement, forwarded to its investigation unit, is covered under Governance and regulation → Public debate and participation in policymaking below.

Libya

LPTIC [met Nokia's regional director on 15 July](#) to discuss network modernisation and 5G deployment; no agreement was announced.

On 7 August LTT and ARABSAT [announced a Strategic Partnership Agreement](#) under which ARABSAT will supply High Throughput Satellite capacity on Arabsat-6A at 30.5 degrees east for LTT's existing and future requirements. ARABSAT's chief executive described the agreement as reflecting the institutional relationship with the Libyan International Telecommunications Company, one of ARABSAT's principal shareholders. No contract value, duration, throughput, coverage or service date was published.

Madagascar

On 11 July 2026 SpaceX ran [Madagascar's first Direct-to-Cell satellite trial at Sadabe](#), on Airtel's spectrum and following an [FCC notice filed on 13 May](#) — the third African country after Kenya and Uganda. Commercial launch is pending the national regulator.

On 23 July Yas Madagascar [ran a 5G-Advanced trial with Huawei at its Andraharo campus](#), pitching the network as a substrate for artificial intelligence, augmented reality and connected devices. The operator claims to be the fourth in the world to test the technology; the claim is its own. The posts and digital development minister attended and tied it to public-service delivery, learning, health and enterprise access. No commercial 5G service is on record.

Malawi

The communications regulator found both mobile operators in breach of the tariff-notice requirement on 17 July 2026, for failing to publish approved tariff changes in at least two daily newspapers seven days before they took effect. Both agreed to credit customers who bought affected products between 26 June and 2 July with bundles equal to the price difference, and to submit evidence of compliance by 31 July ([regulator order](#)). The approved price increase itself stands.

The ICT minister told Parliament on 17 July that additional mobile operator licences are under consideration, and on 24 July that the President had authorised the ministry to identify an investor able to roll out a network without delay; no bid timetable, licence terms or spectrum allocation was stated. The minister also told the House that spectrum licence fees had been reduced by 50%, against the 20% the regulator announced in June 2025 ([parliamentary account](#)).

The gap the licensing round is meant to close acquired figures in August. An industry association report published ahead of its Malawi summit on 20 August [puts fourth-generation coverage at 87% of the population against mobile-internet penetration of 12.5%, with mobile-money adoption described as near universal, and scores Malawi 36 of 100 on its digital nations and society index and 55 of 100 on policy and regulation](#). These are the association's own index and figures; the base still holds no official national subscriber and coverage series.

Mali

On 15 July CSquared [added capacity on the 2Africa West subsea system](#) to the West African backbone whose inland fibre reaches Mali, giving an independent route behind the Abidjan, Accra and Lagos landings.

On 23 July Moov Africa Malitel [announced the retirement of ADSL and migration to FTTH by end-2026](#); no subscriber or coverage figure accompanied it.

On 27 July Maliweb carried a named-analyst investigation into the universal access fund which also [reports AFRIBONE as the sole surviving independent internet provider](#), buying wholesale IP transit at near-retail prices after incumbents allegedly pressed the backbone operator to stop selling dark fibre.

On 30 July the Semaine du Numerique's opening panel [set a universal connectivity target of 2030](#), with the roadmap to be drafted jointly with Burkina Faso and Niger. On 1 August the week's recommendations included [a law making SMTD-SA the sole national operator of transport, transmission, storage and broadcast infrastructure](#).

Mauritania

The regulator's provisional selection for satellite telecommunications licences was [reported on 7 July](#). Thirteen firms took the dossier and nine bids were submitted across two lots. For mobile personal satellite communications, [BRAINSAT at US\\$800,000 and VDM at US\\$50,000 were retained](#), VDM required to align its offer with BRAINSAT's; for the sale of satellite capacity, [BRAINSAT at US\\$3 million and Mattel at MRU 6.5 million](#) were retained on the same condition. No launch date or licence issue is reported, and the operating conditions, licensee obligations and control mechanisms are still to be defined. The account is Agence Ecofin's reading of the regulator's communiqué, which is not held.

The second operator [launched a commercial 5G network at Nouakchott on 10 August under the digital transformation minister](#); no coverage, tariff or subscriber figure accompanies it. The Ministry of Digital Transformation and Administrative Modernisation said on 24 July that [all electronic-communications operators have activated IPv6](#) across their networks and services, and that the national committee monitoring the transition

recorded tangible progress, with one unnamed operator past 15% of subscribers migrated against a 25% end-2026 target. The ministry's stated rationale is sovereignty and security rather than address exhaustion — IPv6 as the precondition for 5G, cloud, internet-of-things and AI services.

Mauritius

The Prime Minister announced on [16 July 2026 that Mauritius will join the America-India Connect subsea cable programme](#). Reporting on [2 August established what sits behind it](#): a signed non-disclosure agreement, terms still under negotiation, no published timetable. The driver is ageing infrastructure — LION and LION2 still carry most international traffic — and the same account notes that Google already operates a ground station at Baie-du-Jacotet serviced by the state operator, so the cable would deepen a relationship rather than open one.

Morocco

An operator and a vendor placed a dual-band radio configuration into commercial service along the high-speed rail and motorway corridors on 30 July 2026, claiming a 13 dB coverage gain, 83% higher average downlink throughput and 3.2 times the active users with no additional sites built ([deployment account](#)). Every performance figure is the operator's and the vendor's own.

The transitional reduction of mobile interconnection tariff asymmetry took effect on 1 July 2026, running to 31 January 2027, with full symmetry from 1 February 2027, recorded in the incumbent's own half-year filing ([operator filing](#)).

The vendor has since put figures on it: [roughly a kilometre of extra range, an 83% download-speed gain and 3.2 times more concurrent users per site](#), against a regulator count of 19.4m mobile subscriptions and a 34.04% share for the operator at the end of March. The performance gains are the vendor's own.

Mozambique

The regulator opened a public geospatial broadband coverage portal on 22 July 2026, built with two commercial suppliers, letting the public check operator coverage and speeds by location and report gaps ([regulator communique](#)). No usage or gap-report figure has been published since. A [second account of the launch](#) names the two suppliers and sets the portal alongside World Bank project figures on affordability, recorded under inclusion below.

The incumbent operator's ownership is in play. The government has [formed a technical team to negotiate the sale of part of the state's stake in the loss-making operator](#), which carried a US\$400m debt in 2023. No buyer, share, valuation, timetable or treatment of the debt is stated.

The ministry put numbers on how far the connecting has got and how far it is meant to go: [149 localities and 418 schools connected, against a target of at least 300 localities, up to 4,000 schools and around 10,000 new 4G and 5G access points](#). Both ends are the ministry's own and no completion date is given, which leaves a target without a deadline against a rural access rate the regulator itself puts at a quarter of the urban one.

Namibia

On 30 July the ministry, the regulator and three operators met the traditional authorities' trust on streamlining tower siting and cutting deployment delays and costs; the ministry reported no agreement, instrument or timetable ([convening account](#)). Traditional authorities manage communal land, which the ministry treats as the siting constraint.

Niger

On 27 July the telecommunications regulator [opened a second drive-test campaign over Niamey, running to 28 August 2026](#), to verify the corrective actions ordered after the April-May control found voice and mobile-data quality deficient at all four operators, with SMS alone compliant and one operator additionally below the 4G coverage thresholds.

Nigeria

An account published on 29 July puts about [101,000 km of fibre already built](#) and finds that it bypasses some 130m Nigerians — a utilisation and last-mile finding sitting directly against the 90,000 km headline of the national fibre programme.

What is built is being cut faster than it is being protected. The regulator [put fibre-optic cable cuts from road works at more than 5,000 in the first half of 2026 and stood up a standing committee with the works and communications ministries and the National Security Adviser's office](#) to coordinate protection of fibre designated as critical national information infrastructure. No terms of reference, meeting cycle, budget or enforcement power is published for it.

The backbone programme meanwhile looked outward before it broke ground. Nigerian and Burkina Faso digital ministries [met in Ouagadougou on 12 August to explore connecting the planned 90,000 km open-access backbone into Burkina Faso, with a stated aim of halving internet costs through it](#). Nothing was signed, and physical deployment still stands at 2027 on the project documents.

On the tower estate, shareholders of the tower company [approved the acquirer's cash buyout of the 75.3% it does not already own](#), the target's first-half revenue rising 8.2% to US\$844m while rising Nigerian diesel costs and acquisition charges cut operating income 38%. Federal strategic review of the transaction is the last position the base holds on the state's side.

Two build programmes put dates on themselves. The government says resource mobilisation and contracting are complete for [about 3,700 towers to be deployed from October for more than 20 million people in unserved and underserved communities, with the first being installed in Delta State and riverine communities targeted before mid-2027](#); no contract value or supplier is stated. Where fibre does not reach at all, an operator [now runs nearly a dozen light-beam links across Lagos serving banks, hotels, internet providers and a utility, and plans to extend to Abuja, Ibadan and Kano](#). A state airport also [activated a multi-gigabit backbone on 8 August over a commercial submarine-fibre network, to carry passenger processing, operations and real-time security monitoring](#).

The state also went back to orbit, and changed suppliers doing it. The Federal Executive Council [approved the acquisition and deployment of two high-throughput communications satellites, NIGCOMSAT-2A and 2B, to be built by Thales Alenia Space and Israel Aerospace Industries on 22 August, with NIGCOMSAT-2A due by the end of 2028 and 2B in 2029 or 2030 on the operator's own timetable](#). The award [breaks with the Chinese partnership that built NigComSat-1, which failed in November 2008, and NigComSat-1R, launched in 2011 and approaching the end of its fifteen-year design life](#), and sits alongside a January 2025 partnership with Eutelsat for low-earth-orbit services. No contract value is published and negotiation with the two manufacturers precedes manufacture.

Rwanda

The legacy-network retirement plan the ministry announced on 28 July fixes third-generation service off nationwide on [30 June 2027](#), with operator pilot shutdowns during 2026 and critical-system migration completed in the first half of 2027. December 2028 is the working date for the older, second-generation network, expressly conditional on coverage, voice reliability including emergency calls, continuity of mobile money and payments, migration of

dependent systems, and the availability of affordable handsets. The technical precondition for the switch-off schedule fell into place days later: the dominant operator launched voice over fourth-generation networks, reported on 3 August, with no coverage, handset-base or subscriber figure and no completion date given. The source makes no reference to the sunset. [A subsea operator announced a 25,000 km system across fifteen countries on 9 July with no timeline disclosed](#); a landlocked country's exposure to it is backhaul rather than a landing. As at 30 July the World Bank's successor nine-year country partnership framework is prepared but not launched, with no committed envelope on the record.

The cross-border route got its operator's own description as the peering forum met in Kigali: [a 2,000km protected corridor from Goma to Mombasa connecting Kigali, Kampala and Nairobi, inside a network the operator puts across sixteen African countries](#). Both figures are the operator's own.

Senegal

[A teleport gateway entered service, reported 10 July, with sixteen new antennas and a Tier III room linking a low-orbit constellation to terrestrial networks](#).

Two financing items arrived within a week. On 13 July a development bank [extended a senior facility of up to EUR 270m, EUR 170m committed, for 4G, 5G and fibre in Senegal and Kenya](#) — its first Senegal project, with Senegal's share not disaggregated. On 16 July a presidential meeting produced an [announced intent of US\\$150m from a tower operator](#), with no signed agreement or schedule; the account traces solely to the Presidency, and trade press moved from *plans* to *commitment* in a day with no new evidence.

A measurement covering January to July put [mobile latency at 35.4 ms, second in sub-Saharan Africa behind Togo at 28.8 ms](#); no prior Senegal figure is held.

Seychelles

[Airtel Seychelles switched on commercial 5G on 3 July 2026](#), pairing the launch with a content partnership with SBC. [Starlink's soft launch followed on 21 July](#), reported by State House the next day, with several subscribers already active; the wider African rollout that included Seychelles [reached 28 of 54 African markets by 28 July](#).

Sierra Leone

CSquared [added capacity on the 2Africa West submarine system to the West Africa backbone that reaches Sierra Leone](#) on 15 July 2026, giving automated rerouting across physically diverse paths after repeated regional outages.

The health ministry [launched Starlink service at the Julius Maada Bio Paediatric Centre of Excellence on 27 July 2026](#), the first of a stated 300 government health facilities. Neither account of the launch gives the cost, the funder, the procurement route, the contract term, or any data-residency arrangement for public health traffic carried by a foreign satellite operator.

South Africa

The [National Radio Frequency Plan 2026](#), approved by the minister on 2 July, was gazetted on 24 July and realigns the allocation table from 8.3kHz to 3,000GHz to the ITU Radio Regulations and to the SADC and African Telecommunications Union plans. The [IMT Roadmap 2026](#) was published for consultation the same day; its tables record 794MHz assigned to licensees and 18,831MHz still to be assigned. The regulator's [accompanying statement](#)

of an increase from 850MHz to at least 18,588MHz by 2030, and of a 215% rise in high-demand spectrum, does not appear in the gazetted text; the two accounts have not been reconciled. Allocation of the 6GHz band was deferred pending a feasibility study.

Herotel, a domestic provider with more than 350,000 customers, was named Amazon Leo's South African distributor for a 2027 launch. Starlink began service in its 27th African country and remains unlicensed in South Africa; the department told Parliament its draft satellite policy direction was "of general application and not directed at any specific operator". The state-backed BrainSAT venture launched on Emirati infrastructure. By 20 August the licensing question had produced three separate moves and no decision: the minister told the International Space Summit Africa that low-earth-orbit services are part of the country's digital future while conceding that licensing is the regulator's call alone, which leaves his December directive on equity-equivalency schemes unresolved; Starlink's operator asked the regulator for flat per-licence spectrum fees, blanket terminal licensing and a ten-year minimum licence term, and used the same submission to ask for consolidated guidance on the 30% equity threshold; and Amazon's Kenyan subsidiary applied for a fifteen-year gateway licence next door, which is what building out around an unresolved market looks like.

The month's largest infrastructure fact was not the state's. Comsol began selling wholesale access to a national 5G-only home-broadband network, with resellers owning the customer relationship and the first ISP due live in September, its chief executive accepting the description that this is the wholesale open-access network the state spent more than a decade trying to licence and abandoned. It is privately financed, after Nedbank Private Equity's exit in December, and publishes no coverage footprint, site count or wholesale price, so what has entered service cannot be sized.

Cape Town's municipal planning tribunal approved two Equinix data centres over objections from three civil-society organisations; the application disclosed neither water nor electricity demand, both deferred to the site development plan. Reuters put the planned load at about 170MW. NTT Data South Africa confirmed it had sold seven facilities and leased them back. Google held its first African cloud summit in Johannesburg and announced an Eastern Cape exchange port; the President welcomed hyperscaler commitments while stating that government is building its own cloud through the CSIR.

One date the state does not have is the oldest. The communications department told parliament that no date has been set for the analogue television switch-off, sixteen years past the original 2010 deadline, with estimates of households still dependent on analogue ranging from about 500,000 on one civil-society account to between 2.2m and 4.5m on two others. The record reconciles none of them, and the absence of a date is now carried as a gap.

South Sudan

The regulator completed the second stage of its tariff exchange-rate adjustment effective midnight on 26 July 2026; phase one had taken effect on 26 June. MTN South Sudan, Zain South Sudan and Digitel all raised voice, data and SMS charges, citing inflation, fuel costs, network maintenance paid in foreign currency and depreciation of the South Sudanese pound, running base stations largely on diesel generators for want of grid power. Neither the regulator nor the operators disclosed the revised rates or said whether further phases will follow, and the regulator maintains this is a revision of the exchange rate used to calculate charges rather than a tariff increase.

On 20 July the regulator closed a two-day inception workshop launching development of a National Spectrum Management and 5G Strategy with the ICT ministry, the Eastern Africa Regional Digital Integration Project and an expert team. Its outputs were a methodology, a work plan and governance structures; no spectrum plan, band allocation or timetable is published.

On 29 July, leaders of Kauto Administrative Area in Eastern Equatoria [stated that the area has mobile coverage only at Kuron and that four further sites have been requested for years without explanation for the delay](#). The chief administrator said information from three settlements can take one to two weeks to reach his office, arriving by road with travellers. Leaders reported that operators raised doubts about revenue from the area, and a coverage extension expected from February 2026 has not materialised.

Tanzania

The minister inspected the national backbone at Mpwapwa on 24 July. The network stands at about [14,000 km carrying four public data centres and a third landing cable](#); in the region inspected, 942.5 km had been built against 65 people connected. The regional manager stated that phase one connected government offices and public institutions, with individual citizens next. At the same inspection [636 masts were stated due in March 2027, with a second programme of 280 masts under way](#) with no cost, financier or completion date given.

On 29 July the Kenyan and Tanzanian ministers [launched a terrestrial fibre link across the border, integrating the national backbone with submarine cable capacity](#). No capacity, cost or financing was stated, and the base does not reconcile it against the 2025 connection on the route.

A separate tower programme reported its own reach to Parliament on 15 August: a [TZS 126bn, 758-tower project – TZS 55bn from the World Bank and TZS 71bn from the universal service fund – has connected 8.5 million people across 1,400 villages](#), in the same report that records 14,826 data controllers and processors registered with the data protection commission by June 2026. The ministry gives no count of towers completed against the 758 planned, and no measure of service uptake in the villages it says are connected.

Togo

The Council of Ministers [authorised a five-year renewable licence for Internet-of-Things networks](#) on 4 August, distinct from the incumbent mobile and internet authorisations; the decree authorises the grant rather than recording it, and no licence number, fee, coverage obligation or ownership of the licensee is published. Separately, [capacity was added on a second submarine system for route diversity](#) after three multi-country West African outages in twenty-eight months – a pan-regional arrangement in which Togo is one of eleven places named and no Togo-specific capacity, price or route figure appears.

Tunisia

A measurement study of North African 5G published on [3 August 2026](#), cited rather than absorbed, reports the Tunisian 5G median down 30% from launch by month six and the combined 4G and 5G median below the pre-launch baseline, while fixed-wireless lines rose to 319,554 by May 2026 under the regulator's 30 Mbps obligation. Nothing published bears on the submarine cables, data centres or satellite licensing.

The one physical build to move was a stalled one. The grands projets commission [ordered immediate procurement to complete the Cite Numerique d'Ennahli technology park](#) at a review session chaired by the Prime Minister on 10 August, alongside unrelated power-station and hospital projects. No cost, completion date, occupancy plan or account of why the park was incomplete is stated.

Uganda

The regulator published sector figures on 2 July: [about 47 million active SIM subscriptions and smartphone usage of 20 million devices, up from 18 million](#). The regulator's own quarterly report for the period to 30 September 2025 recorded 45.7 million active mobile subscriptions; both sets are compiled from licensees' submissions.

On 5 August the network operator with the largest published footprint released its 2025 sustainability report, recording for the year to 31 December 2025 [24.2 million subscribers, population coverage of 96.2% 3G, 88.6% 4G and 19% 5G, 27,037 km of fibre and 45% of network sites on solar or hydro](#). These are the company's own unaudited figures and the base holds no prior-year comparator.

Zambia

A government-owned shared 4G network for public institutions was launched at Ndola Teaching Hospital on 15 July 2026, run by the state ICT institute with three named partners and the health ministry ([launch account](#)). The reported outcomes are clinician accounts at the launch site; no baseline or measured result is held.

On 5 August the institute confirmed that connectivity gaps persist at Nakonde, Victoria Falls, Kazungula and Chirundu, and set a single national standard through the government network of tiered 10 to 100 Mbps bandwidth, dual links with automatic failover and enterprise-grade firewalls. A trade facilitation body has commissioned an audit of ICT infrastructure at five border posts; no budget, timetable or completion date is published, and the audit precedes the procurement rather than following it ([status update](#)).

Zimbabwe

Phase 1 of the cross-border fibre corridor from Plumtree to Bulawayo was reported live and carrying traffic on 3 July 2026, at an initial equipped capacity of 800 Gbps on equipment rated above 10 Tbps; phase 2 to Livingstone is due in September 2026 ([corridor account](#)).

The listed infrastructure company reported for the quarter ended May 2026 that it deployed 90 new base stations and reinvested 17% of revenue into capital projects on an undisclosed revenue base ([trading update](#)).

The state fixed operator's chief executive told its annual general meeting on 26 June that government arrears had risen to close to US\$42m, also given as ZiG1.2bn, from US\$19.2m a year earlier ([annual general meeting account](#)). The state mobile operator terminated its chief executive's contract on 4 August following a board resolution ([termination account](#)).

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
