

MONTHLY UPDATE

Cybersecurity: monthly update, July 2026

Edition of 2026-08-25 · compiled from the Data Landscapers source base

41 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.

The place reports do not share one window; the period above is the range they span.

Algeria

The cybersecurity record this window is a warning about the state's own brand rather than about its systems. The Algiers wilaya [told citizens that unlicensed platforms are impersonating its institutions and public enterprises, mostly as fake e-ticketing storefronts built to harvest bank card details and personal data, and directed them to check the domain name before paying and to use only officially approved portals](#). It is a communique, not an enforcement action: no takedown, prosecution or count of impersonating sites is on record. The exposure it describes tracks the payment figures in the section below — more web merchants and more card use give a counterfeit storefront more to imitate.

Angola

The incumbent operator's mobile voice, data and internet services failed nationwide from 02:20 on 28 July, affecting more than twenty million customers; fixed fibre and fixed-wireless stayed up throughout, so the failure was confined to the mobile layer. The network itself came back over four days — localised from 11:45 on 29 July, full second- and third-generation national coverage at about 23:00 on 30 July, and [messaging and electronic airtime sales back on 31 July](#). The services running on it took nine: the operator dates [voice, messaging, mobile data, internet access and the third-party services carried over its network to 5 August](#), and gives the same close in [its own market update](#). Four days in, [card terminals were unreliable in Luanda shops and at filling stations and citizens were queueing at the ATMs for cash](#); a week in, [the cardless payment app was still unusable and Luanda bank branches were queueing one to two hours](#). No attribution, access vector or scope of data loss is established.

The aftermath produced the first public pressure for rules rather than repair: customers and security practitioners [called for mandatory incident-reporting obligations and a national computer security incident response team](#), small businesses describing lost sales and failed card payments across the disruption. Angola has neither: the base holds no CSIRT and no reporting duty, and the critical national infrastructure designation that would carry one is itself *Not held*.

The Executive's first answer to the National Assembly on critical-infrastructure risk, given on 31 July, was the standing build programme — the national data centre and the country-code domain — with no new measure, obligation or timetable announced. Telecommunications remains undesignated as critical national infrastructure, and named analysts argued during the month that it should be designated alongside power and water.

A regional preparatory meeting on radiocommunications opened in Luanda on 3 August, seven days into the outage and two before it closed, with the resilience of telecommunications infrastructure on its agenda.

Check Point Research's July telemetry [puts Angolan organisations at 5,714 attacks a week against an African average of 3,237](#), the highest of the four African markets it broke out — the vendor's installed base, not a national measurement.

Benin

The month's one figure for how exposed the country is came from a vendor rather than the state. In a national newspaper interview the head of the computer emergency response body [cited 631 ransomware threats detected in Benin in 2024, on security-vendor telemetry reported through Interpol's Africa assessment](#), attributing the rise to fast adoption outrunning security practice and to a criminal market where access and tooling can be rented rather than built. How much of the national estate that vendor sees is unpublished, so the count is not a measure of national exposure, and no incident, ransom-payment or recovery figure stands beside it.

Burkina Faso

The Council of Ministers of 30 July [adopted two decrees applying the 2024 information-systems security law](#): one identifying, classifying and setting obligations for critical-infrastructure bodies, expressly spanning energy, water, health, telecommunications and finance, and one fixing periodic security audits and vesting auditor accreditation in the national cyberspace control body. The law had asserted both duties since July 2024 with no machinery attached.

The building meant to carry the supervision got its first progress statement in seven months. The digital transition minister [inspected the site on 5 August](#), where the technical managers put physical execution across that worksite and the first citizen service centre together at about 20%; the account names the build the Centre d'opération du Réseau Backbone national and gives it the same supervisory function the January account gave the supervision centre. The stated delivery month is October 2026.

Burundi

EAC central bank governors, meeting in July 2026 as the Monetary Affairs Committee, [flagged cybersecurity risk to the regional financial system as requiring stronger common measures](#), with no common measure yet adopted.

Cameroon

A [fourth loan tranche of FCFA 39.2bn for intelligent urban video surveillance was authorised by decree](#), bringing FCFA 150.8bn mobilised over eight years across three Chinese lenders. The first phase's borrower was the defence ministry, and the two accounts held give different amounts and dates for it. No camera count, coverage area, retention rule or oversight arrangement is published for any tranche.

The month also produced the base's first measure of what cybercrime costs an individual here. A comparative study puts the [average loss per online job scam at 132,000 FCFA for Cameroonian victims, against 58,000 FCFA in Chad](#), and finds 82% of the Cameroonian cases to be WhatsApp-based social engineering linked to Nigerian networks, where the Chadian pattern is more localised SMS and voice phishing. It is a survey of respondents rather than a reported-crime series, and no sample size or national loss total is carried in the record held.

Cape Verde

The surveillance programme moved to a third phase on foreign money. China [made about EUR 9.3m available as non-reimbursable assistance for phase three of the Cidade Segura project](#), the implementation agreement signed in the week to 15 August by the interior minister and the Chinese ambassador at the National Police Command Centre in

Praia, and stated as reinforcing the technological and operational capacity of the security forces and supporting criminal investigation. [Phase three covers command centres, data centres and wireless base stations at Assomada, Tarrafal de Santiago and Porto Novo, and expanded video surveillance in Praia and Mindelo.](#) No camera count, retention rule, data-protection authorisation or oversight arrangement is published for this phase or the two before it.

Chad

The window's one cyber measure is a loss figure, and it comes from research rather than from the state. A comparative study of online job scams [puts the average loss for a Chadian victim at 58,000 FCFA per incident, against 132,000 FCFA in Cameroon,](#) and finds the Chadian cases to be predominantly localised SMS and voice phishing — 70% of respondents — where the Cameroonian pattern is WhatsApp-based social engineering linked to Nigerian networks. It is a survey of respondents rather than a reported-crime series, and neither a sample size nor a national loss total is carried in the record held. Chad has no computer emergency response team and no adopted cybersecurity strategy, so there is nothing on the state's side of this to compare it against.

Congo

It [launched an open international tender on 23 July for a 24-month mission to draft the national cybersecurity strategy, a national training plan and national conferences,](#) scope covering a sector diagnostic, a strategic roadmap and a standing forum; no contract value is published. On 28 July it [validated a consolidated draft setting qualification conditions for bodies authorised to audit information systems nationally,](#) with no adoption instrument, publication date or entry into force stated. Its largest operational mandate arrived through tax legislation: a [decree of 31 March, published 9 July, puts the agency into joint homologation of every invoicing terminal, software and enterprise module;](#) it awards the security label and conformity identifier, audits the infrastructure and takes [15% of homologation fees.](#) The same roadmap also names a [national security operations centre and response team](#) among its infrastructure programmes; it does not exist either.

Cote d'Ivoire

The cyber agency [commissioned the national public key infrastructure](#) on an announcement dated 23 July 2026, on the legal basis of the 2013 electronic-transactions law and its 2014 and 2016 decrees. It is the trust anchor for every certification authority operating on Ivorian territory; the agency's own notice is not held, so the technical commissioning date is unestablished.

Djibouti

The national incident response team took part in the IGAD regional cybersecurity exercise from 26 to 30 June, and the state daily reported that [the ANC's team placed first in both simulation scenarios.](#) The exercise organiser has published no result, so the placing rests on that single account. It is the only cybersecurity movement the base records for Djibouti in the period.

DR Congo

A workshop named a [national cybersecurity agency as one of five bodies whose roles in the incident-notification chain must be clarified, explicitly without creating new institutions;](#) no creating instrument, budget line or head is held.

An operator launched a [subscriber-level child filtering service on 17 July](#) from 50 units for 30 days — a commercial service, not a state measure, with no subscriber figure.

Egypt

The national computer emergency readiness centre is [named as delivery partner in the state cyber-skills academy](#) and is developing capability using artificial-intelligence techniques against cyber threats. No incident statistics, mandate document, budget or reporting obligation is held for it.

Equatorial Guinea

Ley 7/2024 of 23 December 2024 creates ANCIC, the National Cybersecurity and Critical Infrastructure Agency, under the Presidency, stated to draw on the Budapest and Malabo conventions.

Eswatini

On 30 July the SADC Committee of Central Bank Governors subcommittee on banking supervision, meeting at Ezulwini, [approved regional frameworks on cybersecurity, climate-related financial risk and cross-border crisis management](#). The Central Bank of Eswatini governor urged supervisors to extend oversight to cloud hosting providers, payment processors and AI used in credit scoring.

Gabon

The utility [restored billing and payment in Libreville and seven interior centres after the attack that took down 95% of its systems](#), describing its network on 4 August as healthy, secured and protected by reinforced measures, with restoration continuing elsewhere. The account is the company's own, the attackers are described as unidentified, and no forensic, criminal or damage-cost report is on file.

An audit that was signed in May reported in August. The state digital agency [delivered its information-systems audit findings to the health insurance fund on 12 August](#), three months after the two signed the memorandum, naming human resources, data and infrastructure as the three pillars of the fund's technology roadmap. The findings themselves are not published, and no remediation plan, timetable or cost is stated.

Ghana

A community-media cyber capability project launched on 3 August, certifying community-radio journalists into a standing press corps.

The Cybersecurity Act's licensing regime produced its first published penalties. The Cyber Security Authority [fined the Office of the Registrar of Companies and Purpleline Solutions a combined GH¢360,000 for breaching the Act's licensing requirements on 13 August — GH¢240,000 against the Registrar in two penalties of GH¢120,000 for engaging an unlicensed cybersecurity service provider, and GH¢120,000 against the provider for operating without a licence](#). One of the two penalised bodies is itself a state registry. Five days later the Authority [fined a Big Four firm's Ghana practice GH¢360,000 — three penalties of GH¢120,000 — for continuing to provide regulated cybersecurity services, including to owners of critical information infrastructure, after three directives to obtain a licence](#), ordering it to cease and desist, governance, risk and compliance work included. The base holds no published penalty under the Act before 13 August, so both actions fall inside six days, and the Authority states it will name unlicensed providers publicly as an enforcement measure. Neither of the two largest penalties survived the week as announced. The firm's fine was declared [satisfactorily resolved in a joint statement issued the same day](#), which does not state whether it

was paid, reduced or withdrawn; and the Registrar [rejected its own sanction as premature and procedurally unfair, dating a finance-ministry commitment authorisation to 28 November 2025 and its tender to 4 December, before the directive it is said to have breached](#). A regime whose first week of enforcement produces one settlement without terms and one contested timeline has published a gross figure, not a collected one.

The regulator also [held a two-day consultative and validation workshop with UNICEF Ghana on online child sexual exploitation and abuse](#), reviewing the national response and naming coordination and frontline-capacity gaps; no instrument or programme follows from it on the record.

It started teaching. A session at Accra on 19 August [put newsroom devices to journalists as deliberate targets rather than accidental victims, citing an Angolan journalist's 2024 spyware infection as the regional precedent](#). No count of journalists trained under the project has been published.

Guinea

The cybersecurity statute of 2016 is held and cannot be read: the agency [publishes it as a 57-page image-only scan with no text layer](#), so its provisions — reaching cybercrime offences on Guinean territory and offences requiring collection of electronic evidence — are known from the agency's own summary rather than the statute's words.

Kenya

The presidency's website was [defaced on 18 July with a 5 BTC ransom demand and restored on 20 July](#) — the second compromise of that portal in eight months. State House says no evidence of data access was found; cause and attribution are undisclosed.

A vendor threat report published on 13 August put the exposure at the ordinary end rather than the novel one: [malicious email attachments dominated, 46.2% of them scripts, quick-response-code phishing rose 145% between the second half of 2025 and the first of 2026, exploitation of a 2017 Office vulnerability more than doubled, and one loader became the country's fourth most-detected malware family](#). The figures are the vendor's own detections, not a national incident series.

Lesotho

The [interim Lesotho National Computer Security Incident Response Team](#) and the inaugural National Cybersecurity Forum were launched in Maseru on 29 July 2026. The forum is described by the Lesotho Communications Authority as a standing collaboration across government, industry, regulators, financial institutions and telecommunications providers. The response team is thus operating ahead of its enabling statute — the Cybercrime and Cybersecurity Bills it would sit under remain before the National Assembly — and on no published timetable. The ministry also reported a first Chief Information Security Officer appointed across government and a national Security Operations Centre being stood up.

Liberia

The Cybercrime Act 2025 [had still not received presidential signature as of 1 July](#), nearly six months after the Senate's concurrence cleared its passage through the Legislature. The full text the base holds is the 2021 base bill, which carries none of the 2025 provisions.

Libya

The central bank [isolated its systems in June](#) and a sample of bank data was later published on a dark-web site. No attribution, forensic account, scope of loss or restoration statement is held.

The interior ministry answered with an agreement rather than an instrument. It [signed a technical cooperation agreement with the national telecommunications company on 12 August](#) covering digital transformation, cybersecurity and telecommunications infrastructure, including shared platforms, installation of towers and equipment at ministry sites, and technical support. No value, duration or delivery date is published.

Mali

A [national information systems security agency was created by Council of Ministers texts of 10 June](#). No budget, staffing or constituting text is published.

Mauritania

PAFIID reported on 8 July that the Central Bank's AI-supported reputation-protection platform had detected [more than 10,000 electronic threats in the first half of 2026](#) — phishing, impersonation, application and site fraud — of which 470 were confirmed and removed, with 20 digital identities protected.

Mauritius

Two cyber measures moved. The [July omnibus would empower the central bank to establish a cyber threat intelligence sharing platform](#) and to require financial institutions, and others it specifies, to participate — the clearest instance of mandatory threat-intelligence sharing in primary legislation on this record. At a [workshop on 29 July](#) the postal operator began being wired into the Universal Postal Union's global postal threat-sharing centre, with the ICT minister naming ISO/IEC 27001 as the standard he wants adopted.

August supplied the first figure for what any of this is against: [more than 4,000 reported cyber incidents in Mauritius since January 2026](#), given at the launch of the schools awareness programme. No reporting body, definition or comparable earlier period is named with it.

Morocco

The [national cybersecurity strategy to 2030](#) is now held in full: four pillars — governance, cyberspace resilience, capacity development and regional cooperation — with 11 objectives, 26 initiatives and 60 actions, succeeding the first strategy of 2012. Its workforce commitments carry no numbers, and a [separate held source dates a national cybersecurity strategy to 2023 with US\\$100m earmarked and an agency created](#) — whether the two are the same instrument is not established.

Mozambique

The same institute account of 23 July states that the Cyber Security Law creates the national incident response team and seats its operation inside the institute ([institute account](#)).

Namibia

The regulator recorded 513,921 vulnerabilities and 161,547 cyber events between April and June 2026, up 39.8% and 56.7% on the prior quarter, and attributed the rise to systems needlessly reachable from the internet, unpatched software and weak authentication ([regulator account](#)). The figures come a quarter after incident management guidelines were issued in April 2026.

The regulator and the chamber of commerce signed a three-year memorandum in Windhoek on 30 July with a joint steering committee, covering public key infrastructure, cybersecurity, electronic trade facilitation, regulatory standards, legislative reform, digital literacy and capacity building; no funding, deliverables or milestones were published ([memorandum account](#)). The regulator separately stated on 29 July that it is the national root certification authority.

Nigeria

The communications regulator [issued a Guidance Note on cybersecurity budgets on 7 August](#) under a framework effective since 23 February, adding a dedicated budget line with tracked spend and periodic audit, requiring a Chief Information Security Officer, and restating two-year in-country retention of call logs and traffic data; the compliance clock ends 23 February 2027. Two further bodies are announced and no more: [a Ministerial Advisory Council on Cybersecurity](#) with no membership or terms of reference published, and [a Payment Security Operations Centre](#) set as a 2028 target with no legal basis, funding line or operator named. Where staffing did move it moved on a foreign programme: the national cybersecurity coordinator [put a United Kingdom-funded bilateral partnership at more than 90 per cent implemented on 22 August, crediting it with the continent's first four SIM3-certified incident-response auditors at the national coordination centre, a reviewed national incident response plan and maturity frameworks for critical national information infrastructure](#). The completion figure is his own, and neither the memorandum nor the programme document is held.

Senegal

On 30 July the procurement authority and the ministry [floated three routes for buying critical-infrastructure cybersecurity](#) — a three-year standing supplier arrangement, functional specifications, and pooled purchasing — with no timetable or contract value. The state's own diagnosis locates the blockage in procurement, not in budget.

The offence figures the case for all this rests on moved barely at all: national police recorded [3,794 cybercrime offences in 2025 against 3,902 in 2024](#), reported alongside an international police organisation's estimate of at least US\$5bn in Africa-wide losses over the same year. Neither the recording basis nor a clear-up rate is stated.

Seychelles

The [National Assembly voted unanimously on 22 July 2026 to approve accession to the Budapest Convention on Cybercrime](#), a motion tabled by Hon. Sylvanne Lemiel. The accession itself, an executive act, has not yet followed.

Sierra Leone

The telecoms regulator ran two public-facing cyber messages in nine days. It [set out a consumer education campaign on online fraud on 28 July](#), stating that the fraudulent links circulating did not originate from the mobile networks and placing the burden on the consumer; on 30 July it [confirmed it was coordinating a response to ongoing cybersecurity incidents affecting digital services](#), naming no affected service, no attribution and no incident count.

The first tool rather than message came from an operator, not the state. On 18 August a mobile operator [launched a scam-alert channel for suspected fraud against its mobile-money service, reached on a *505# short code, an online form or a 111 call](#). It is one operator's own channel: no report volume, response time, remedy, referral route to the police or coordination with the regulator's response is published, and the Cyber Security and Crime Act 2021 still carries no reported prosecution.

Somalia

The National Communications Authority [launched a National Cybersecurity Risk Management Framework on 21 July 2026](#), following the national consultation held in April. It covers risk identification, regulatory compliance and institutional responsibilities. No compliance deadline, reporting duty or penalty is published alongside it, and it is the third instrument in a cyber stack assembled inside eighteen months, after the Cybersecurity Law of January 2026 and the incident response team that opened in March.

South Africa

Two independent readings of the year both point at the same thing. The financial regulator's fourth regulatory actions report records [140 public warnings and R2.89bn in penalties on 76 persons for the year to March](#), most warnings concerning unregistered providers promoting investment offerings on social media and about a fifth involving impersonation of licensed institutions, the regulator and its own staff among them. [Over R2bn of that total is a single deepfake-advertising matter](#), whose debarment and penalty reconsiderations were still pending at the report date. Separately a forensics firm puts [attacker dwell time at 18 days in 2025, with some intrusions running start to finish inside a day](#), attributed to ransomware-as-a-service and automated reconnaissance. It is one firm's caseload rather than a national series, and a shorter dwell time is faster execution, not better defence.

The state's answer to its own exposure is a training tender. The public service and administration department is [tendering to build a training programme for departmental information security officers across the public sector](#), to implement the directive on public service information security. No officer count, curriculum, budget or compliance deadline under that directive is stated.

Its own research estate showed what the exposure costs. The science minister told the National Assembly on 24 August that the late-May breach of the national supercomputer was caused by [vulnerabilities associated with the legacy high-performance computing system](#), with unauthorised access to parts of the environment and cryptocurrency mining malware deployed, and that [ageing components are technically constrained or no longer fully supported by their original vendors](#). A remediation and resilience programme covering access controls, privileged-access management, network segmentation, patch management and monitoring has since run, with forensic support and independent assurance from the council's own specialists. No cost, data-loss finding or outage duration is stated, and the account is the department's own — against the same centre having reached maximum capacity earlier in the month.

Sudan

The Council of Ministers reviewed a draft Cybersecurity Law on 6 August 2026, alongside draft Data and AI and Digital Transformation laws, and sent all three back for further study; no text has been published for any of them. A Sudanese delegation separately told an Arab-experts meeting in Tunis on 30 July that the country's cybercrime provisions are drafted to prevail over any conflicting law, reasoned on state sovereignty — a claim not yet reconciled with the draft law's own unsettled status.

Tanzania

One investigation put numbers on SIM-registration fraud: [198 SIM cards used in fraud were seized at Morogoro, 88 of them registered by a single agent under different names.](#)

August gave the national series the earlier account lacked. The regulator told Parliament it had [blocked 39,117 fraud-linked phone numbers and 6,118 domains and applications in the 2025/26 financial year, removed 7,311 violating accounts and submitted 56 security-incident reports to the police; and it identified 7,334 mobile lines linked to fraud between April and June 2026, down 25.3% from 9,817 in the preceding quarter](#), with two regions flagged as priorities and the regulator, operators and security agencies convening in August to coordinate further measures. Blocking is not prosecution: [56 incident reports stand against 39,117 numbers blocked](#), and no conviction or restitution figure is held.

The same budget statement [provides for cybercrime investigation centres at Dodoma and Zanzibar](#). Nothing is built, sited or staffed on the record, and the country still holds no published national cybersecurity strategy to place them in.

Togo

The cyber institutions are in place and the record of what they do is thin. [The national incident-response function runs inside a joint venture of the Togolese state and a Polish group](#), so the incident record, tooling and institutional memory sit with a foreign supplier; no incident-response profile or annual report is held. The agency's director-general put [more than 333,000 incidents handled between 2021 and 2024, rising from 39,168 to 181,088](#) — a 4.6-fold increase with no figure for 2022, 2023 or 2025 and no definition of an incident. Funding arrived alongside it: [a cybersecurity component was signed with Luxembourg](#) inside a three-accord package of EUR 78,550,000, its digital and cyber share not separately quantified.

Tunisia

The national cybersecurity agency [warned on 30 July 2026 of an SMS phishing campaign](#) built on fake unpaid-traffic-fine notices sent from foreign numbers, carrying links to counterfeit platforms that harvest banking and personal data. Its advice was to distrust unsolicited messages, and its offered test was that Tunisian government sites use only the national domain. The lure borrows the credibility of the state's own digitised payment channels; the response on record carries no takedown power and names no data-protection authority. A [second alert on 14 August](#) warned of a surge in social-media account takeovers worked through SMS and email verification-code social engineering.

The scale behind the alerts was published on 7 August: [57,430 cyberattacks recorded in the first half of 2025, and ransomware cases up 140% to 37,076 in 2024](#), on interior ministry and agency figures, as the government finalised a National Cybersecurity Strategy 2026-2030 aimed at critical-infrastructure resilience and skills. The two figures cover different periods and are not a series; no definition of a recorded attack and no incident-reporting obligation behind the count is stated.

Uganda

The ICT ministry [launched an updated national information security framework on 16 July](#), developed under the Uganda Digital Acceleration Project and setting minimum controls for government institutions, citing a 60% year-on-year rise in attacks including a UGX 62bn central-bank incident. The framework document itself is not published.

On 17 July the regulator opened work on a [national anti-piracy coordination framework](#) with broadcasters, three mobile operators, the revenue authority and the registration bureau. Legitimate pay-television subscriptions were [given as about 800,000 in March 2026 against about 1.65 million in 2021](#). Dynamic address and name-resolution blocking is under exploration, and participants at the convening raised the dual use of blocking infrastructure built for piracy.

Two accounts in August put the threat above the response. A continental police assessment [attributes over US\\$2m of losses to a single Ugandan deepfake investment scam](#), against 8% of intelligence analysts recorded as having advanced artificial-intelligence expertise and 94% of agencies as lacking digital forensics tools. At the communications regulator's first national cybersecurity conference on 13 August, an operator [called for fraud protection to be built into digital-finance products and described an interface letting banks check for recent SIM-swap activity before processing a transaction](#); no uptake figure for the interface is published. The central bank separately told a conference that [cybersecurity is now a national security issue](#).

Zambia

The Ministry of Information and Media declared the Cyber Crimes Act No. 4 of 2025 fully operational on 18 July 2026, warning that recording, publishing or distributing private communications without authorisation could bring prosecution and singling out public servants on confidential information. Compliance obligations were stated as extending to financial institutions, telecommunications operators, digital platforms, mobile money providers and e-commerce businesses ([enforcement account](#)). The declaration falls twenty-six days before the general election of 13 August. No prosecution, charge or conviction count has been published.

Three days earlier the cyber security agency had urged journalists to learn the cyber laws, framing them as protection for media houses against ransomware and disruption.

The regulator reported on 4 August that it had deactivated 43,500 SIM cards linked to mobile-money fraud and secured K19.8 million between January and June 2026, on consumer reports through a short code, with no breakdown by operator and no prior-period comparison ([regulator figures](#)).

Zimbabwe

The national incident response team is named in the ICT ministry's own priority projects and has no completion date or operating status attached. The international project record behind it [carries an empty status field and an achievements field still stating it will be updated on completion](#), for a project that ran from July 2017 to February 2021. What is new is the first-party statement: the [ministry lists establishment of the team among its seven priorities](#), aimed at monitoring, detecting and responding to cyber threats.

ABOUT THIS DOCUMENT

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
