

MONTHLY UPDATE

Sierra Leone: monthly update, July 2026

Edition of 2026-08-23 · 40 systems and instruments tracked, 11 of them not held

Developments recorded from artefacts published between 2026-07-01 and 2026-08-23 – July 2026 carried forward to the date of issue, so the report holds the nightly catch to the day it was cut. Sections follow the status report.

Summary of the month

Two arguments ran side by side in Sierra Leone during July and the first week of August 2026, and both concern the same register. The identity authority and the communications ministry each set out publicly how the country's digital public infrastructure should be sequenced, and the ministry conceded in Parliament that the identity-to-SIM linkage it is relying on to police mobile-money fraud is incomplete. In the same weeks the central bank awarded contracts to re-platform both national payment rails, the government convened a dialogue to make a 2019 statute operable, and the telecoms regulator confirmed it was managing cybersecurity incidents whose scope it did not describe.

Infrastructure

Connectivity

CSquared [added capacity on the 2Africa West submarine system to the West Africa backbone that reaches Sierra Leone](#) on 15 July 2026, giving automated rerouting across physically diverse paths after repeated regional outages.

The health ministry [launched Starlink service at the Julius Maada Bio Paediatric Centre of Excellence on 27 July 2026](#), the first of a stated 300 government health facilities. Neither account of the launch gives the cost, the funder, the procurement route, the contract term, or any data-residency arrangement for public health traffic carried by a foreign satellite operator.

Data Storage

The same 7 August account states the biometric register runs on a Tier III data centre, as reported by the NCRA Director-General ([consultation account](#)).

Energy

The constraint under everything else eased slightly. A World Bank-funded [40MW solar-plus-storage project at Lungu and Newton became fully operational, commissioned in July 2026 and projected to raise the electricity access rate toward 36%](#) and to ease the outages that interrupt telecommunications and digital services. The access projection is the project's own; no generation outturn, grid-availability series or measured effect on network uptime is held, so the connection between the plant and the services it is said to protect is asserted rather than shown.

Cybersecurity

The telecoms regulator ran two public-facing cyber messages in nine days. It [set out a consumer education campaign on online fraud on 28 July](#), stating that the fraudulent links circulating did not originate from the mobile networks and placing the burden on the consumer; on 30 July it [confirmed it was coordinating a response to ongoing cybersecurity incidents affecting digital services](#), naming no affected service, no attribution and no incident count.

The first tool rather than message came from an operator, not the state. On 18 August a mobile operator [launched a scam-alert channel for suspected fraud against its mobile-money service, reached on a *505# short code, an online form or a 111 call](#). It is one operator's own channel: no report volume, response time, remedy, referral route to the police or coordination with the regulator's response is published, and the Cyber Security and Crime Act 2021 still carries no reported prosecution.

Digital public infrastructure

Data Exchange

The finance ministry is [piloting a data exchange layer on X-Road](#). No production date, list of connected agencies or governance rules is published.

The exchange that already carries the state's money was found to be carrying something else. The anti-corruption commission [puts over 300 billion leones lost to backend manipulation of the customs system, with processed declarations deliberately deleted and dormant bank-teller profiles used to validate transactions after the account holders had left their institutions](#), and reasonable grounds to suspect coordinated collusion. The finding and the figure are the commission's own; no revenue-authority response, prosecution or remediation is on record.

Digital Identity and CRVS

Identity took three public positions in four days. MoCTI [convened a national dialogue on digital identity and digital public infrastructure on 5 August](#), describing it as the first of a series and as the beginning of the policy work rather than its result. A private-sector consultation the following day settled two specifications: the register being built on is MOSIP-based, and the credentials envisaged under the Bhutan National Digital Identity and SIGN Foundation partnership are W3C-compliant verifiable credentials. On 7 August the NCRA Director-General told the consultation that [the biometric register already covers about 93% of the population with a unique National Identification Number and a live eKYC platform, and that the Authority's own MOSIP pilot is complete but unfunded for full implementation](#) — and warned against parallel identity systems being built alongside it.

In a 4 August ministerial statement responding to the mobile-money fraud surge, the communications minister [conceded the NIN-SIM linkage does not yet cover every subscriber](#).

Digital Payments and Fintech

A re-platforming of the national payment rails — real-time gross settlement and automated clearing — is reported to have been contracted in early August, but no award notice from the Bank of Sierra Leone or the procurement authority is published, and the aggregator listing that carried the figures is not an origin this base accepts. The award is not held, and no amount, supplier or scope is stated here on that basis.

The same 4 August ministerial statement [disclosed about 390 Orange mobile-money fraud complaints logged in 2026 to date and more than 18,000 police requests for subscriber data answered](#).

Registries (population, land, address, etc.)

The registry the state has least of is the one for deaths. The national public health agency [opened supplier engagement on 7 August for an Integrated National Digital Mortality Surveillance, Registration and Certification System](#), with the health ministry and the civil registration authority, aligned to WHO ICD-11 and built on a national health information hub established in January 2026 — against a gap in which only 13.4% of deaths are fully registered. No cost, supplier, timetable or coverage target is stated.

Two days later the civil registration authority and its partners marked African civil-registration day by [calling for an integrated, decentralised, digital birth-to-death registration system, with UNICEF costing US\\$1.16m of strengthening needs over three years](#), and the electoral commission and the central bank naming the 2028 elections and financial inclusion as what depends on it. What a citizen pays for the document at the end of that chain is contested: a civil-society account [questions whether people can afford the national identity card at NLe140 now that it is central to linking identity numbers to SIM registration](#).

Sectoral management information systems (HMIS, EMIS, etc.)

A digital health programme covering electronic medical records, disease surveillance and telemedicine across 300 facilities [began with satellite connectivity at the first of them on 27 July](#). One facility of three hundred is the whole of the deployment so far, and [neither account of the launch gives cost, funder, procurement route, contract term or any data-residency arrangement for public health traffic carried by a foreign satellite operator](#).

Other GovTech and e-Gov

The National Public Procurement Authority [sent a delegation to Liberia on 6-7 August to study that country's electronic government procurement system](#). No Sierra Leonean platform, procurement decision or timetable follows from it on the record. The visit was reported on 12 August as [a deepening of bilateral cooperation between the two countries' regulators and procurement authorities on digital transformation and procurement transparency](#), which restates the same event rather than adding a commitment.

Two systems the state watches itself with did move. The audit service's [management information system entered final user-acceptance testing after post-configuration training on 3 to 5 August](#), built with World Bank funding by customising a platform of the African organisation of English-speaking supreme audit institutions, before it is

declared operational. And the monitoring and evaluation agency is [expanding its information system for real-time remote tracking of the 100 to 250 public projects launched each year](#). Neither account states a cost, a go-live date, or whether any of the tracked data reaches the public.

Rural digital data capture

The agriculture ministry is [finalising an upgraded interactive voice response platform, reported 98% complete, to give farmers direct access to ministry officials](#) under the national food-security agenda. Voice is the right channel for the users it names, and the account states no launch date, language coverage, call volume or cost — [98% complete](#) being the ministry's own description of a system nobody outside it has used.

Use of satellite data

DSTI announced on 4 August that it is [developing a national base map with the Ministry of Lands, with JICA support and Japanese technical direction, phase one covering Western Area Urban District](#). No cost, timetable, hosting arrangement or data licence is stated.

Governance and regulation

Legislation and regulation

A public-private dialogue on 27-28 July was convened [to operationalise the Electronic Transactions Act, in force since December 2019 and never given certification authorities, evidence procedures, dispute mechanisms or penalties](#). It is to produce a gap analysis, a policy memorandum and an implementation roadmap, with no adoption date for any of the three, and worked to [functional equivalence and technological neutrality](#).

The regulator announced on 30 July that the [Subscribers Regulations 2025 will fine operators 25,000 new leones for each unregistered or pre-activated SIM, with a staged disconnection ladder and SIMs matched to National Identification Numbers](#). The six-month transition is presented as running from that announcement, so the phase-out date is unestablished, and the instrument's own text is not held.

Mobile-money fraud reached Parliament. A legal analysis of 23 July found the [National Communications Authority Act 2022 addresses its enforcement powers to licensees only, with no statutory reversal mechanism, no SIM-swap safeguards and no allocation of loss for authorised push payment fraud](#); a former minister replied on 26 July that the [central bank's existing know-your-customer rules are adequate and only enforcement is missing, identifying no provision by instrument or section](#). The two accounts have not been reconciled.

Strategies, plans and policies

Delivering a ministerial statement on 4 August after [MPs demanded an explanation for the surge](#), the communications minister [set out education, institutional strengthening and better investigation](#). No liability rule, refund duty or operator obligation was proposed.

The multi-agency answer to mobile-money fraud got a drafting session. A two-day workshop on 18 and 19 August brought the central bank, the telecom and mobile-money operators and the cybersecurity bodies together to draft a roadmap, after parliamentary pressure over identity-theft scams on one operator's network. No roadmap, deadline or funding line has been published.

Regional collaboration

Regional health data gained an institutional seat. The health minister attended the inaugural board meeting of the Health Intelligence Centres for Africa in Addis Ababa with the head of the national health information hub, Sierra Leone being a founding member and sitting on the strategic advisory board. Founding membership is a position the base can state; what it cannot yet state is what the body will do with member states' health data, since no constitutive instrument, budget or data-sharing arrangement is published.

Standards

The national open-source software policy for the public sector is in force, approved in 2025. No compliance or adoption reporting has been published against it.

Data protection

Data-protection work in the window was training rather than enforcement, and it went to the government's own builders. The communications ministry took the science and technology directorate's technical team through artificial intelligence and data protection by design, and through its obligations under the cybersecurity statute, the civil registration act and the forthcoming data protection law. Training a state team on a law not yet passed is the sequence this section keeps recording: the Data Protection and Right to Access Information Bill is still in development, so the obligations taught are prospective.

Artificial intelligence and the technology sector

AI

DSTI reported on 24 July that its deepfake and digital-misinformation campaign, running since May 2026, has reached Freetown, Makeni, Port Loko, Magburaka, Bo, Kenema and Kono, convening paramount chiefs, district officials, security institutions, councils and universities, with participants reporting voice-cloning scams impersonating public figures. Broadcast programming, a national capacity-building workshop and a verification chatbot are announced as the next phase. No budget, funder or completion date is stated, and no legislative or platform-facing instrument accompanies it.

Inclusion and capacity

Access to services

Financial inclusion is put at about 40% of adults for 2025. It is a named analyst's assessment rather than an official series, and the base holds no state measurement to set beside it.

The cost of the handset is being financed rather than reduced. An operator and a commercial bank [opened a 24-month device-financing scheme to individual and business customers, on top of their existing prepaid card relationship](#). No price, interest rate, eligibility test or uptake figure is stated.

Training and skills

MoCTI and three other bodies [launched a digital skills programme for civil servants on 10 July 2026, with 1,000 places in year one and stated targets of 3,000 medium-term and 5,000 long-term](#) across six areas including artificial intelligence and cybersecurity, aimed at gaps outside Freetown.

The country held its [first academic exhibition dedicated to Digital Public Goods on 27 July, where 11 student-built solutions were evaluated against the DPG Standard](#). The curriculum behind it, built with UNICEF, the United Nations University and Limkokwing University, has [taught more than 1,100 students and appointed 14 campus champions across four universities](#).

On the skills side, [eighty young people graduated from a nine-month digital-literacy course at Kenema on 8 August, reporting job retention and promotion](#). The outcomes are the graduates' own and no tracer study is held.

Finance

New investments

The same statement — [reporting the academic Digital Public Goods exhibition](#) — also gives the Sierra Leone Innovation Investment Fund a target of US\$150m over five years, with no amount raised.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
