

MONTHLY UPDATE

South Africa: monthly update, July – August 2026

Edition of 2026-08-27 • 120 systems and instruments tracked

Developments summarised from sources published between the beginning of last month and today.

SUMMARY OF THE MONTH • GOVERNANCE • FINANCE • ICT INFRASTRUCTURE • DPI • DIGITALISATION • TECHNOLOGY
• CAPACITY • INCLUSION • DATA

Summary of the month

Two spectrum instruments were gazetted, the national artificial-intelligence policy changed from a rule-making instrument to a guidance one, and the Western Cape High Court struck down part of the birth-registration regulations. On delivery, a Public Service Commission investigation found [more than R2bn in irregular expenditure](#) at the State Information Technology Agency, which was [given 30 days to produce a recovery plan](#). Operation Vulindlela's quarterly report of 31 July recorded the single citizen application at [production-ready pilot](#), dated the next milestones to September 2026 and stated that progress had been uneven.

Governance

Strategies, plans and policies

The state put two studies out to tender and conceded the gap they are meant to fill. The communications department's market-analysis tender [concedes a current policy vacuum and that the price benefits expected from the 2022 spectrum auction remain largely unmet](#), naming market concentration, spectrum allocation and the burden on prepaid consumers as structural causes; its deliverables are a cost-to-communicate roadmap and an assessment of progress on the 2019 data-services market inquiry recommendations. A second tender [seeks an ICT-indicators and scenario-modelling system to steer the digital economy to 2050](#), with no award, value or delivery date. Against both, the reform programme's quarterly report [concedes progress has been uneven and in certain instances slower than initially anticipated](#), against the 80% on-track figure that remains its dated prior.

A third instrument is being fast-tracked rather than tendered. The Presidency and the planning and evaluation department [put a digital dashboard monitoring mega infrastructure projects before the parliamentary committee on the Presidency](#), alongside a wider review of progress against the state-of-the-nation commitments. No delivery date, data source, custodian or statement of whether the dashboard will be public is given — which for a monitoring instrument is the whole of the question. The portfolio minister separately [set out persistent governance and liquidity problems across the department's eleven state-owned entities](#), citing progress stabilising boards and the state IT agency's leadership, a completed public broadcaster funding model now with the Treasury, and ruling out a compulsory household levy.

Legislation and regulation

The minister [backed the regulator](#) in the review application brought by the two largest mobile operators against the data bundle roll-over rules. The Angolan kwanza became the [second settlement currency on the SADC real-time system](#), the first addition since 2013.

Cross-border crypto acquired a draft rulebook. The Treasury and the central bank [published a draft manual for cross-border crypto activities for comment to 30 September, setting authorisation and reporting rules for crypto asset service providers and defining what counts as a cross-border crypto flow](#), alongside the capital-flow regulations already in draft.

Data protection

The data-protection statute has been enforceable since 2021 and operates as an adequacy model rather than hard localisation: [cross-border transfers are permitted where equivalent protection, consent or contractual necessity applies, with the controller accountable](#). The [maximum fine is R10m against a measured average breach cost of R44.1m](#) — the penalty is a fraction of the harm it is meant to deter.

The supervisor said plainly what it cannot do. At a webinar on 18 August the regulator [said it has no capability to test external systems for privacy compliance before launch, and is working with the justice department to amend the Act to cover artificial intelligence and privacy by design](#), while the rights commission reframed misuse of personal information as a constitutional harm bearing on dignity, equality and access to services rather than a cybersecurity one. A peer-reviewed review published four days earlier [records South Africa among three of four countries studied that have not signed the continental data convention, and finds all four health-data governance frameworks fragmented](#).

Standards

Parliament's communications committee [prefers strengthening the existing regulators through the ICT and media regulators forum to creating the four artificial-intelligence bodies the withdrawn draft policy proposed](#). The forum was launched in 2024 and no instrument establishing its powers is held.

Public debate and participation in policymaking

The rights commission put a position on the record about who should arbitrate what is true online. Launching its policy brief on information integrity, [a deputy justice minister said government should not become the custodian of truth on disinformation, while warning against leaving the information environment to private platforms' algorithms](#), grounding the balance in the constitutional rights to expression, political participation and access to information. It is a brief rather than an instrument, and no legislative proposal follows from it on the record.

Finance

New investments

One programme opened in the window, and it is not yet a commitment to anybody. On 11 August the United Kingdom [published an expression-of-interest call for a Southern Africa science and technology accelerator worth up to GBP2.5m over three years to March 2030, with up to GBP400,000 for 2026/27](#), covering artificial intelligence and emerging technologies and digital access alongside climate, energy, health and space. South Africa is the primary focus and Zimbabwe and Zambia the first year's. The fund is resourced and the delivery consortium is not chosen, so what the money buys is a matter for a contract expected later in the year.

ICT Infrastructure

Connectivity

The [National Radio Frequency Plan 2026](#), approved by the minister on 2 July, was gazetted on 24 July and realigns the allocation table from 8.3kHz to 3,000GHz to the ITU Radio Regulations and to the SADC and African Telecommunications Union plans. The [IMT Roadmap 2026](#) was published for consultation the same day; its tables record 794MHz assigned to licensees and 18,831MHz still to be assigned. The regulator's [accompanying statement of an increase from 850MHz to at least 18,588MHz by 2030, and of a 215% rise in high-demand spectrum](#), does not appear in the gazetted text; the two accounts have not been reconciled. Allocation of the 6GHz band was [deferred pending a feasibility study](#).

Herotel, a domestic provider with more than 350,000 customers, was [named Amazon Leo's South African distributor](#) for a 2027 launch. Starlink [began service in its 27th African country](#) and remains unlicensed in South Africa; the department told Parliament its draft satellite policy direction was ["of general application and not directed at any specific operator"](#). The state-backed [BrainSAT](#) venture launched on Emirati infrastructure. By 20 August the licensing question had produced three separate moves and no decision: the minister [told the International Space Summit Africa that low-earth-orbit services are part of the country's digital future while conceding that licensing is the regulator's call alone](#), which leaves his December directive on equity-equivalency schemes unresolved; Starlink's operator [asked the regulator for flat per-licence spectrum fees, blanket terminal licensing and a ten-year minimum licence term](#), and used the same submission to ask for consolidated guidance on the 30% equity threshold; and Amazon's Kenyan subsidiary [applied for a fifteen-year gateway licence next door](#), which is what building out around an unresolved market looks like.

The month's largest infrastructure fact was not the state's. Comsol [began selling wholesale access to a national 5G-only home-broadband network, with resellers owning the customer relationship and the first ISP due live in September](#), its chief executive accepting the description that this is the wholesale open-access network the state spent more than a decade trying to licence and abandoned. It is privately financed, after Nedbank Private Equity's exit in December, and publishes no coverage footprint, site count or wholesale price, so what has entered service cannot be sized.

Cape Town's municipal planning tribunal [approved two Equinix data centres](#) over objections from three civil-society organisations; the application disclosed neither water nor electricity demand, both deferred to the site development plan. Reuters put the planned load at about 170MW. NTT Data South Africa confirmed it had [sold seven facilities and leased them back](#). Google held its first African cloud summit in Johannesburg and announced an Eastern Cape exchange port; the President welcomed hyperscaler commitments while [stating that government is building its own cloud through the CSIR](#).

One date the state does not have is the oldest. The communications department [told parliament that no date has been set for the analogue television switch-off](#), sixteen years past the original 2010 deadline, with estimates of households still dependent on analogue ranging from about 500,000 on one civil-society account to between 2.2m and 4.5m on two others. The record reconciles none of them, and the absence of a date is now carried as a gap.

Data Storage

The commercial estate is expanding on the operator's own numbers rather than on a published plan. An international operator is [scaling its Johannesburg facility to 24MW and holds a ZAR7.5bn South African expansion budget covering that site plus banked land in Johannesburg and Cape Town](#), with further build-out held pending demand. No

grid connection, water use or municipal approval detail is stated — and a civil-society coalition used the same week to call for deceleration, transparency and public participation in data-centre expansion, which is the argument the absent detail is about.

The expansion also drew its first organised objection. A civil-society coalition [submitted concerns to the human rights commission on 10 August calling for a halt on data-centre developments pending transparent public participation, citing strain on scarce water, land and electricity](#). No participation process, commission response or moratorium is on record, which is what makes the objection the only thing here that can be dated.

Two compute announcements closed the month, both making sovereignty the argument and both resting on the announcer's own figures. Three partners [launched what they describe as Africa's most powerful AI cloud, a 7.2 EFLOPS deployment on more than 50 NVIDIA B300 HGX servers carrying over 400 GPUs in carrier-neutral Tier-3+ colocation, pitched as keeping African training and inference workloads, and the data behind them, resident on the continent](#); no independent benchmark, customer, price or site accompanies the number. Separately the mobile operator group [named the UAE backer of its Africa Data Hub Holding vehicle as Tarek Al Ashram, founder of the Dubai colocation operator Gulf Data Hub](#), three days after its own half-year results booklet named the vehicle without the partner behind it, [with a first phase targeting 150MW across South Africa and Nigeria](#) and no split, site, cost or commissioning date stated. Against those, the one deployment in the country with an externally verified figure is the Cape Town artificial-intelligence factory, which [entered the June 2026 global supercomputer list at rank 36 on 285,696 cores and 77.79 PFlop/s measured against a 102.16 PFlop/s theoretical peak](#).

Energy

The grid had its best month on the utility's own reporting in six years. Eskom [put the energy availability factor at 67.55%, its highest in six years, with unplanned outages down 44.5% year on year, about 1.2 million customers removed from load reduction and 505,607 smart meters installed](#), the Eastern Cape becoming the seventh province removed from load reduction. These are the utility's figures and no regulator or system-operator confirmation accompanies them.

It closes a build programme rather than opening one: the last unit of the two flagship stations [entered commercial operation in September 2025, adding 800 MW](#). What the month does not settle is adequacy after 2029, which the system operator's own assessment identifies as the risk and which is carried in the progress report rather than here.

Technical Capacity

Parliament's science committee reported after an oversight visit that the [Centre for High Performance Computing has reached maximum capacity and that available infrastructure is insufficient for future growth](#). The centre is one of three pillars of the national cyber infrastructure system, alongside the research network and the secure national data centre, and it supports the electronic vaccination data system.

Cybersecurity

Two independent readings of the year both point at the same thing. The financial regulator's fourth regulatory actions report records [140 public warnings and R2.89bn in penalties on 76 persons for the year to March](#), most warnings concerning unregistered providers promoting investment offerings on social media and about a fifth involving impersonation of licensed institutions, the regulator and its own staff among them. [Over R2bn of that total is a single deepfake-advertising matter](#), whose debarment and penalty reconsiderations were still pending at the report date. Separately a forensics firm puts [attacker dwell time at 18 days in 2025, with some intrusions running start to finish inside a day](#), attributed to ransomware-as-a-service and automated reconnaissance. It is one firm's caseload rather than a national series, and a shorter dwell time is faster execution, not better defence.

The state's answer to its own exposure is a training tender. The public service and administration department is [tendering to build a training programme for departmental information security officers across the public sector](#), to implement the directive on public service information security. No officer count, curriculum, budget or compliance deadline under that directive is stated.

Its own research estate showed what the exposure costs. The science minister told the National Assembly on 24 August that the late-May breach of the national supercomputer was caused by [vulnerabilities associated with the legacy high-performance computing system](#), with unauthorised access to parts of the environment and cryptocurrency mining malware deployed, and that [ageing components are technically constrained or no longer fully supported by their original vendors](#). A [remediation and resilience programme covering access controls, privileged-access management, network segmentation, patch management and monitoring](#) has since run, with [forensic support and independent assurance from the council's own specialists](#). No cost, data-loss finding or outage duration is stated, and the account is the department's own — against the same centre having reached maximum capacity earlier in the month.

DPI

Data Exchange

Two exchanges were arranged this month and neither states what happens to the data. The medicines regulator [opened a pilot inviting sponsors and investigators to report serious adverse events through an externally hosted module](#), routing South African clinical-trial safety data through infrastructure hosted by the WHO's Uppsala centre and adopting its reporting standard rather than a domestic one; no pilot duration, participant target, data-residency statement or transition date to mandatory reporting is published. The revenue service [signed an implementation arrangement with Malawi's revenue authority for a secure platform exchanging customs information in real time](#), aligned to the World Customs Organisation data model and operationalising a mutual assistance agreement negotiated in 2019. No go-live date is stated, and no purpose-limitation, retention or reciprocity terms are published.

A third exchange was put out for comment rather than arranged. The revenue service [published a consultation paper proposing a five-corner digital VAT model — electronic invoicing, an interoperability framework and electronic reporting — moving toward VAT auto-assessment, with a phased rollout from 2026/27 and feedback due 16 October](#). It is the one of the three that will reach every registered business, and it is the one still open to be argued with; no cost to business, exemption threshold or accreditation regime for service providers is stated.

Digital Identity and CRVS

Absa [joined the bank-branch smart identity channel](#), which the department put at 296 branches and more than 385,000 applications in four months; Operation Vulindlela's quarterly report [gave 203,887 applications across 171 branches](#). The reference periods differ and the figures have not been reconciled. Mobile operators and the justice department agreed a framework to [replace document presentation in SIM registration with real-time departmental verification](#). The base has since taken in a submission made on the closing day of the draft Identification Regulations' comment period on 6 June, in which a research organisation asked the department to suspend the regulations pending a published digital identity policy, an enacted National Identification and Registration Bill and demonstrated compliance with the data-protection Act, on the ground that they build biometric enrolment, trusted-entity accreditation and real-time verification with no formal role for the Information Regulator. The submission is held as a supplied document with no published address, so it cannot be linked to a reader.

On 29 July the Western Cape High Court [held four categories of exclusion in the birth-registration regulations unconstitutional](#), allowing 18 months for amendment and holding that the orders required no Constitutional Court confirmation.

Home Affairs reported that its electronic travel authorisation had [refused more than 5,500 travellers](#) since October 2025. It then left the pilot: the system [went live at OR Tambo, Cape Town, King Shaka and Lanseria from 12 August, with 6,126 fraudulent applications rejected — put at 2.8% of pilot submissions — and full visa-type rollout targeted by year-end](#). The department publishes no statistical series, and the four rejection counts it has given this year rest on bases that do not reconcile.

By mid-August the branch channel had a locator of its own. The department [launched a My Home Affairs Online portal on 17 August to help citizens find a participating branch, putting the network at 372 branches and more than half a million users to date](#), and framing it with the electronic travel authorisation as a building block of the national digital public infrastructure roadmap. Its own downtime statement a week earlier put the branch count above 408; the two are not reconciled. The travel authorisation itself [drew industry questions over its R500 fee and the adequacy of consultation](#) after its airport launch.

The draft digital-identity regulations drew their sharpest technical criticism yet. A published argument holds that they [under-specify verifier authentication, transparency about the purpose of a request, and enforcement of data minimisation](#), and urges binding rules requiring a requesting party to prove who it is, state why it is asking, and log every share — so that accountability falls on institutions rather than on the citizen who consented.

Digital Payments and Fintech

Operation Vulindlela's quarterly report of 31 July recorded the Payments Ecosystem Modernisation programme moving beyond conceptual design into active development of a payment credential, wallet, governance and trust capabilities, with testing against government use cases dated November 2026. Nothing held states how that rail relates to the bank-API rails below.

The Reserve Bank gazetted a [national interoperable payment code standard](#), with PayShap the first rail to adopt it. Ozow launched a shared [bank application-programming-interface rail with FNB and RMB](#), its fourth such arrangement, and Pepkor announced a [R21.3bn merger of Flash and Shop2Shop](#), subject to approval.

What that migration costs the institutions running it surfaced in one bank's half-year results. [Technology spending reached R8.78bn in the first half of 2026, up 7%, against digitally active customers up 14%, with a further R200m software impairment after a R2.4bn write-down in 2025, and a cost-to-income ratio still rising across a 17-country, 13.4-million-customer footprint](#). It is one bank's own group figure, so it bounds the cost of digital migration at a single institution rather than for the sector.

Registries

Home Affairs reported [377,060 identity numbers still blocked](#) and stated it could not trace approximately 400,000 of those affected, against a court deadline extended to March 2027.

Sectoral management information systems

The student funding scheme's administrator submitted a stabilisation plan stating that [ICT is the scheme's biggest operational risk, fragmented, manual and not fit for purpose](#). The same submission reports 66 major audit findings and a disclaimer audit opinion from the Auditor-General, 115 overdue internal audit findings and nine material irregularities, five of them data or systems defects. The scheme was placed under administration in May and its governance failures referred to the Special Investigating Unit.

Other GovTech and e-Gov

Operation Vulindlela's quarterly report of 31 July recorded an update under way to the [Minimum Interoperability Standards and the Government-Wide Enterprise Architecture](#), with an update due September 2026.

On 3 August the single citizen application was reported as a [production-ready pilot](#), its first credential use case a digital matric certificate built with Umalusi, with the verification approach in testing.

Two of the state's own systems produced numbers in August, one improving and one lost. Home Affairs cut [nationwide system downtime from 35,426 hours in 2024/25 to 13,867 in 2025/26, a 61% reduction](#), and a [parliamentary reply gives the fuller picture: the population register's own downtime fell only from 14,720 to 11,479 hours, a 22% improvement](#), with the department crediting the state IT agency's move from a bronze to a silver service level, 226 links migrated to fibre, 182 offices moved to a web service manager and 439 offices running on the identification system. The register — the layer everything else depends on — improved least, and the department led with the front-office figure.

The revenue service opened a consultation of its own on 18 August, on a [digital VAT model combining electronic invoicing, an interoperability framework and electronic reporting](#), framed as moving VAT administration off manual processes and retrospective verification and into the systems businesses already run. It follows a 2023 discussion paper and is stated as building blocks: the account held carries no closing date for comment, implementation timetable, cost, mandate threshold or legislative vehicle.

The courts project went the other way. On 13 August the justice minister [referred the courts digitisation project to the special investigating unit and the police priority crimes unit, after the contractor holding outsourced records since 2021 denied the department access to its own records at the Master of the High Court in Pretoria](#). No contract value, term, custody arrangement or data-protection provision for those records is held; a department locked out of its own files is a custody failure before it is a procurement one.

Two services were told to integrate or to open. The Public Protector [found the student-aid scheme's systems insufficiently integrated with the home affairs, social security and revenue data it needs to verify students, and gave the board 30 days to produce a digital modernisation and systems-integration plan covering verification interfaces, fraud controls, the elimination of duplicate applications and manual workarounds, case tracking and costed milestones; the report records that the scheme cannot resolve 80% of contact-centre queries without internal escalation](#). In the Western Cape the province [opened free access for small businesses to a private funding-matching platform covering over 300 funders and 600 finance products](#), against the platform's own finding that 65.3% of provincial applicants cannot supply their latest financial statements.

The month's longest departmental procurement went to the least connected population in the country. Correctional services [advertised a fifteen-year tender for an inmate communication system across 243 centres, replacing copper telephony that has deteriorated beyond support for about 166,000 inmates](#), the appointed supplier to design, install, integrate, operate and maintain it and to tie it to the inmate cash system so that airtime is bought from prisoners' own balances, with monitoring, recording, data storage, security and compliance in scope. No contract value is published and [bids close on 14 September](#), so nothing is awarded.

Digitalisation

Digitalisation of sub-national government

Nothing moved at a municipality this month. What the record gained is the rule the municipal programmes are obliged to work to: the national archives' [standing guidance on managing electronic records](#) is now held, having been cited by none of the digitisation programmes this ledger tracks.

That is an addition to the record rather than a development. No compliance assessment against the guidance appears for any municipality, and the two metro programmes on this ledger — a records digitisation rollout reported to the National Council of Provinces and an electronic records system awarded on a three-year term — both predate this window and are carried in the progress report.

Technology

AI

The Labour Court [stayed disciplinary proceedings](#) against three municipal employees on prima facie evidence that a ruling relied on authorities that do not exist. SARS disclosed that [100% of verification cases and 88.41% of complex audits](#) are selected by automated risk assessment. Huawei reported [1,400 local partners accounting for 94.7% of its local revenue](#) at its Sandton partner event, where South Africa's founding membership of the China-led World AI Cooperation Organisation was noted; the figures are company-reported.

The measured incidence of AI-enabled harm remains low and the reason is contested. An analysis of an incident database published on 14 August [links South Africa to 12 of more than 1,600 recorded global cases through April 2026](#), attributing the low count to public wariness rather than to strong defences, against deepfake, fabricated-citation and biometric-verification incidents already on record. It is a count of *recorded* cases, and no national reporting duty exists that would make the denominator meaningful.

Adoption in institutions ran ahead of the rules governing it, in two settings a month apart. University research finds [artificial-intelligence use in higher-education teaching and assessment outpacing institutional policy, with lecturers reporting inconsistent or absent guidance on accountability, the reliability of detection tools and academic integrity](#); no sector instrument or regulator guidance is held, and that absence is now recorded as a gap. And a major bank reports [more than 39,000 staff, 72% of its workforce, as active generative-artificial-intelligence users on a multi-model enterprise platform hosted on a foreign cloud](#), naming relationship management, servicing, payments and lending as its priority areas. Those are the bank's own figures for users rather than for automated decisions, and no model inventory, assurance process or customer disclosure accompanies them — in a country that holds no artificial-intelligence incident or assurance register at all.

The closest thing to a rule on state automated decision-making is a court case, and it acquired a date this month. An artificial-intelligence governance organisation, represented by a university legal centre, [was admitted as a friend of the court in the state's appeal against the January 2025 High Court judgment on the Social Relief of Distress grant](#), which held several of the grant's regulations unconstitutional on a scheme administered online only and screened by an algorithmic verification system that excluded applicants it read as earning above R624.00. The appeal is set down for 25 August 2026. Rules governing state automated decision-making remain *Not held*; what exists is litigation.

Two smaller items sit at the other end of the same subject. A robotics firm [opened a manufacturing plant and showroom in Durban for an artificial-intelligence humanoid tutor, targeting deployment across roughly 23,000 public schools](#), on a founder's stated ambition rather than a procurement. And a university's radio-telescope demonstrator [was selected to fly aboard a Chinese lunar mission in 2029](#), described as the first all-African space-exploration mission and building on the country's existing radio-astronomy programme.

ICT Industry

The sector's transformation body lost its chair. The communications minister [replaced the B-BBEE ICT Sector Council's chairperson and appointed an interim chair for six months](#) on 14 August, after a departmental investigation found the council dysfunctional. The investigation report is not published, and no remedial plan, terms of reference for the interim period or date for a permanent appointment is stated.

The informal economy became a data product. A listed payments company [began selling near-real-time item-level intelligence on informal retail, drawn from a point-of-sale network of over 90,000 spaza shops and taverns and 10,500 checkouts, to consumer-goods brands, wholesalers and financiers](#). The network figures are the company's own, and no consent basis or data-protection assessment for reselling merchant transaction data is stated.

Platform transport worked the other end of the same problem — getting drivers inside a licensing regime rather than getting data out of them. An e-hailing operator [took its compliance programme to the provinces, holding a North West regulatory engagement in Rustenburg on 18 August attended by more than 150 operators and a Western Cape transport dialogue in Cape Town on 21 August at which the provincial mobility department's director of licensing and adjudication undertook to add e-hailing as a service option on the operating-licence application; the North West provincial regulatory entity put its pending operating-licence backlog at 3,000 to 5,000 applications](#). The account is the platform's own and the undertaking is not yet an amended form.

Innovation ecosystem

The month's addition is a standing one. The small business department's [network of incubation and digital hubs](#) is now on the record, which matters because the two centres opened earlier in the year — a continental digital transformation centre established with the International Telecommunication Union, and an industry and technology centre hosted by a university — both sit on top of an existing state hub estate that the base had never described.

No hub count, spend or enterprise figure is published for any of the three, so the estate is established and its output is not. Both openings fall outside this month and are carried in the progress report.

Capacity

Training and skills

The information technology sector education and training authority was [referred for a governance assessment](#).

The pipeline that authority sits in was reviewed on 14 August. A development bank's report with the higher education department, philanthropically funded, finds [the route from school through universities and technical colleges into employment constrained at both ends — young people arriving without the foundational digital skills the workplace needs, and employers unable to fill digital vacancies alongside high unemployment](#). Its finding is that the mismatch is structural and will not correct itself. That is a verdict on the strategy already under review on this ledger rather than a new instrument.

One intervention was announced against that pipeline, at the far end of the country and five months out. A networking vendor's academy and a private group agreed with the Northern Cape education department to take [networking, cyber security and artificial-intelligence courses into 235 schools as extracurricular classes for grades 10 to 12 from February 2027](#), inside a global programme the vendor says has already trained more than 600,000 South Africans. No learner target, cost, funding split, teacher-training provision or certification pathway accompanies it, and the training figure is the vendor's own.

At the other end of the pipeline, industry began paying for places itself. Two domestic firms [joined a data-centre operations academy as industry partners and are sponsoring a full candidate cohort for its 2026 intake](#), the first South African firms to fund a whole cohort, one opening a newly launched Midrand OEM training facility and the other a live operational data centre to supply the practical component of a graduate-to-employment pipeline, the sponsoring founder framing it as a recruitment expense rather than a training one — which is the clearest statement yet of why the estate's operators are not waiting for the state pipeline above. No cohort size, placement rate or cost per place is published.

Research institutions

The month's one research measure is about the literature rather than the country. A twenty-year bibliometric review [places South Africa 18th worldwide and the only African country among the twenty most productive sources of digital-privacy research, across 4,760 articles published between 2005 and 2025](#). The same review finds refugees, people with disabilities, older people and racial and ethnic minorities notably underrepresented in that literature, so the ranking counts output and not coverage of the populations whose privacy is least protected.

Inclusion

Access to services

The South African Social Security Agency [set 350,000 grant reviews for 2026/27](#) against a projected R1.5bn saving, while beneficiaries flagged from September 2025 [reported continued non-payment](#). An account of the digitalised grants system published on 25 July set out the [bank-account means test applied across eight grants](#), which remains in operation under appeal, with the Supreme Court of Appeal hearing set for 25 August 2026. Gold Cards were confirmed to [cease functioning after 31 August](#); the position of beneficiaries who miss the deadline was not stated.

One cooperation arrangement addressed a group the grants system serves and the data rarely describes. South Africa and China [agreed a seven-point plan on disability-inclusive data, universal design and artificial-intelligence-enabled assistive technology](#), anchored in a proposed centre of excellence working with the national statistics office. No instrument, funding, timetable or data-sharing arrangement is published for cooperation that names the statistics office as a partner.

Data

National statistics

A statistical series came back after five years. Statistics South Africa [restored its monthly insolvencies series, interrupted since the 2021 cyber incident at the Department of Justice cut off the administrative supply, with a first release on 21 July covering June 2026 and a time series back to January 2023](#). It is the clearest cost of a security failure this ledger holds: an official series lost because another department's systems went down, and recovered only now.

The office also published [a frame update for the continuous population survey and household survey programme redesign](#), the instrument intended to carry population statistics between censuses. No first release is named with it.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
