

PROGRESS REPORT

Djibouti: progress report, September 2025 – September 2026

Edition of 2026-09-08 · compiled by Claude Opus from the documents in the Corpus repository

GOVERNANCE · FINANCE · ICT INFRASTRUCTURE · DPI · DIGITALISATION · TECHNOLOGY · CAPACITY · INCLUSION · DATA · GEOPOLITICS · WHERE THE RECORD IS THIN

This report asks the same set of questions of every country. The rows below are a fixed frame of indicators, one row each, chosen in advance and covering all thirty-eight subjects the base tracks — so what appears here is decided by the frame and not by whichever records happened to accumulate. Each row says what happened on that indicator during the period, with every claim linked to the source it rests on.

Where a row reads *No evidence*, the base holds nothing on that indicator. **That is a statement about this base, not about the country** — it does not mean nothing exists, only that nothing has been collected here yet. The rows that carry evidence say what it is; the rows that do not are left to speak for themselves.

The period is 2025-09-01 to 2026-09-08.

Progress values. *Advanced* — a system entered service, a stage was completed or an instrument was made. *Stalled* — a stated target passed without delivery. *Regressed* — an instrument was withdrawn or neutralised, or a reported position worsened. *Mixed* — the indicator's instruments moved in different directions in the period; the clause after the comma names which moved which way. *No change* — the base holds a standing position and nothing in the period touched it. *No evidence* — the base holds nothing on this indicator at all. A value may carry a qualifying clause after a comma, as in *Advanced, regulations still pending*.

Governance

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	Digital transformation strategy	A third national development plan was adopted by decree on 30 June 2026, after a period with no adopted successor plan. There was no adopted successor plan at the window's opening. 2026-06-30 - the 2025-2030 plan was adopted by decree in the Council of Ministers. The plan text is not held, so its digital content, costing and delivery arrangements are not established from anything on file. The standing frame above it is Vision 2035, in force at both ends of the window and restated at a Geneva summit in July 2026 as the basis of the digital-hub ambition.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	ICT strategy	The national ICT development policy is still the framework the ministry cites, with no adopted successor on file. At a world summit in July 2025 the communications minister based his account of national progress on the Politique Nationale de Developpement des TIC as the reference framework, naming broadband deployment and two donor projects as its delivery vehicles. 2026-02 - a World Bank supervision report records a decision to begin updating the Smart Nation strategy to align it with the new national development plan and the new cybersecurity agency. The ministry's own October 2025 stocktake still lists a national digital strategy and sectoral roadmaps among the things to be elaborated. Neither policy text is held here, so what either contains is not established.	NO CHANGE an update to the Smart Nation strategy initiated but not adopted
Strategies, plans and policies	Broadband strategy	A broadband strategy is in place and the universal service fund it names reached draft decree in April 2026. The Strategie Nationale du Haut-Debit was presented in 2024, aligned to Vision 2035 and weighing two coverage scenarios - seven or ten towns by 2027 - with the north served by radio links against optical backbones in the south. No enacting decree for it is held. 2026-04-20 - a regulator and ministry meeting on a World Bank mission's final report produced a draft decree, an internal bylaw and an operations guide for a Universal Service Fund, the financing mechanism the strategy names for underserved areas. The fund itself is not yet constituted.	ADVANCED
Strategies, plans and policies	Data storage / cloud strategy	A sovereign cloud project is envisaged and the ministry still lists cloud adoption among the tasks outstanding. The Smart Nation roadmap envisages a sovereign cloud project whose implementation begins by defining a national cloud framework, a planned instrument rather than an adopted strategy; the same assessment records a central government data centre in operation while many public entities remain on separate infrastructure. 2025-10-07 - the digital economy ministry's report to the Council of Ministers names modernising infrastructure and promoting cloud adoption among the challenges still to be addressed, seven weeks after the Digital Code was published. No cloud framework, data-classification rule or public-sector hosting policy is held.	NO CHANGE
Strategies, plans and policies	Data interoperability framework / roadmap	An interoperability framework is published and maintained by the state information-systems agency, with no evidence of application on file. The Cadre d'Interoperabilite de Djibouti sets twelve principles, four interoperability layers - legal, organisational, semantic and technical - and a conceptual model for integrated public-service delivery, with the state information-systems agency designated to maintain it. Nothing dated in the period touches it. The ministry's own service inventory found the administration fragmented and unevenly equipped, with 503 public services catalogued and 83 selected for digitalisation, which is the closest thing on file to a roadmap and does not reference the framework. No adoption instrument, compliance record or implementation schedule for the framework is held. 2026-09-06 - the framework acquired a statement of intent for the first time since publication: the Council of Ministers' 2026 work programme of 1 September names paperless services and interoperability among the state-modernisation priorities. Nothing in it evidences the 2022 framework in use, and no system, timetable or budget is attached.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Strategies, plans and policies	AI strategy	The first national artificial-intelligence forum opened on 2 September 2026, the strategy set for launch there. None existed at the window's opening; development began with United Nations support, and support was sought from the telecommunications union and a continental body. The strategy is now complete and set for official launch at the country's first national artificial-intelligence forum, dated 2 and 3 September 2026 at Djibouti-Ville, the ministry announcing an artificial-intelligence village at the Palais du Peuple framed around domestic developers and researchers and interministerial coordination for it. The text is still not held, so the launch date is the only new fact and the content remains unpublished. The forum opened at the Palais du Peuple on the morning of 2 September 2026 under the President's patronage. Whether the strategy was launched there is not yet held, and no strategy text is in the base.	ADVANCED
Strategies, plans and policies	Data localisation policies	The Digital Code's transfer rules came into force in September 2025, regulating international transfers rather than requiring domestic storage. Nothing was in force at the period's opening. The Digital Code was published in the Official Journal on 18 September 2025, its articles 99 to 103 controlling international personal-data transfers through adequacy findings and authorisations rather than a blanket domestic-storage requirement. No implementing decree, adequacy list or authorisation decision under those articles is held, and the data-protection commission the Code provides for has no constituting decree on record - so the body that would operate the regime is not evidenced.	ADVANCED
Strategies, plans and policies	Data governance policy	The first book of the Digital Code is the nearest thing to a national data-governance instrument; no separate policy document exists. At the period's opening no data-governance instrument was in force. the Digital Code's first book, published on 18 September 2025, carries the personal-data regime and is the closest instrument on file; no standalone policy document accompanies it. 2025-10-07 - the digital economy ministry names putting data-management and cybersecurity policies in place among the tasks still outstanding, its own account of what the Code does not supply. Classification, retention and stewardship rules for state-held data are not held, and neither is any record of the regime operating.	ADVANCED
Strategies, plans and policies	Open data policy	The Digital Code opened access to administrative documents and the reuse of public data in September 2025, with an annual catalogue duty. No statutory basis for open data was in force at the period's opening. Title 2 of the Digital Code establishes access to administrative documents and the reuse of public data, and requires an annual government catalogue of what is reusable. The national summary data page under the monetary fund's data standard was already in service at both ends of the period. No catalogue has been published under the new duty on any date on file, and no dataset inventory or update policy for the existing platform is held.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Legislation and regulation	Data protection legislation	The data-protection regime sits inside the Digital Code at 156 articles, with none of its obligations evidenced in operation. The regime is in force within the Digital Code across 156 articles, providing for seventy-two-hour breach notification, mandatory data-protection officers and a public register, and none is evidenced in operation. Alongside it a tiered prior-authorisation regime for national-identifier and biometric processing is in force, with no authorisation on record for the police body-camera fleet. Nothing amended either in the window: what changed is what is being processed under them, not the law.	NO CHANGE
Legislation and regulation	Cybersecurity legislation	The Digital Code was published in September 2025 and a statutory cybersecurity authority followed in December. The Digital Code, regulating personal data, electronic communications, cybersecurity and cybercrime, was published in the Official Journal on 18 September 2025 after adoption on 30 June. 2025-11-04 - the Council of Ministers approved the bill creating a National Cybersecurity Authority attached to the Presidency, tasked with the national strategy, protection of critical infrastructure and state information systems; the National Assembly passed it on 12 November. A World Bank report records operationalising the Code's telecommunications and cybersecurity books as a priority; no implementing decree under either is held.	ADVANCED
Legislation and regulation	Legislation covering digital id	Identification is governed by a 2019 law creating the register of natural persons and the national identification number, unchanged in the period. The founding law makes the Registre National des Personnes Physiques the unique reference for identifying individuals and for producing every secure national document - identity card, passport, voter card, driving licence - with administrative management at the population directorate and technical and security management at the state information-systems agency. Its implementing decree defines the identification number as a digital instrument combining civil-status and personal data, and makes its use compulsory across public, parapublic and private administration for identification and third-party data exchange. Nothing amended either in the period; what moved is what runs on them.	NO CHANGE
Legislation and regulation	Digital payments legislation	Payments are governed by a 2016 law placing every payment service under central-bank licensing and supervision, unchanged in the period. The law applies to every payment service and system operated in the country, empowers the central bank to license, regulate and supervise payment-system providers, and defines electronic money and electronic funds transfer. Beneath it the central bank acts by instruction rather than by statute: from 31 August 2025 all cheques had to meet new format, security and encoding standards, with non-conforming cheques refused by the settlement platform and legacy stock withdrawn, a measure that took effect a day before this period opened. No amendment, and no implementing text on electronic money issued in the period, is held.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Legislation and regulation	Legislation enabling data interoperability	A 2022 law gives the digital economy ministry a statutory mandate over the interoperability of state information systems, unchanged in the period. The law establishing the ministry charges it with ensuring the coherence and interoperability of information systems by design, breaking down ministerial application silos and enabling data sharing between administrations through a dedicated platform, in force since 27 July 2022. It is a mandate on a ministry rather than a duty on data holders: no law compels an administration to expose its data, and no implementing decree under this article is held. The interoperability framework the state information-systems agency maintains is a technical document with no enacting instrument on file.	NO CHANGE
Legislation and regulation	AI legislation / regulations	No artificial-intelligence law, decree or procurement rule is held; the strategy in preparation is not an instrument. The position is unchanged at both ends of the window: no law, decree or procurement rule governing artificial-intelligence systems in public use is held, and the strategy under preparation is not an instrument. It matters more here than the absence alone suggests, because systems are already in public use: a weather early-warning system in service and a memorandum for a compute zone signed. Nothing published states what a public body must do before deploying such a system, who may audit it, or what a person subject to one may contest.	NO CHANGE
Legislation and regulation	E-commerce legislation	The Digital Code, eight volumes and about 800 articles adopted on 30 June 2025, is in force with no implementing decree held. The code was adopted by the National Assembly on 30 June 2025, three weeks before the window opened, and is in force across eight volumes and about 800 articles, explained at length in the state daily. No implementing decree is held for any of its volumes. It is the instrument on which the data-protection regime, the prior-authorisation regime and the supervisory commission all rest, and none of the three is evidenced in operation - so a code of eight hundred articles has produced no secondary instrument the base can show in the thirteen months since.	NO CHANGE
Legislation and regulation	Statistics legislation	Two decrees and an order in the period created a specialised statistical corps and approved the institute's 2026 budget. 2026-02-25 - the institute's 2026 forecast budget of 485,686,344 FDJ was approved by order, following board adoption on 18 November 2025 and Council of Ministers review on 23 December. 2026-05-12 - a decree created a specialised civil-service corps of statisticians, engineers, senior administrators and technicians, charged with compiling, analysing and projecting socio-demographic, economic and environmental data. 2026-06-11 - a government reorganisation decree assigns the finance ministry responsibility for the national strategy on collecting, processing and disseminating official statistics. No founding statistics law is held; these are instruments made under a framework the base does not carry.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Legislation and regulation	Access to information legislation	No access-to-information law exists; the 1992 law on freedom of communication is the only instrument on the field. This is a searched absence rather than an unexamined one. A country panel dated April 2026 records that the media and information regime is still governed solely by the law of 15 September 1992 on freedom of communication, never substantially reformed in more than three decades, with no dedicated access-to-information instrument. The same panel names the communication regulator as the operative body and places the country 167th of 180 on the 2026 press-freedom index. The Digital Code's own title on access to administrative documents is the nearest statutory route, and it is a reuse provision rather than a right of access with a procedure.	NO CHANGE
Data protection	Data protection authority	The supervisory commission established by the Digital Code has no record of its constitution, membership, register or decisions. The commission is established by the Digital Code, and the base holds no record of its constitution, membership, register or decisions at either end of the window. Thirteen months after a code of about eight hundred articles took effect, the body that would enforce its data-protection volume cannot be shown to exist. The public register of processing the same code provides for is therefore also unevidenced, and the prior-authorisation regime has no authority on record to grant an authorisation.	NO CHANGE
Data protection	National data protection readiness	Body-worn cameras are in routine police use with no retention period, access rule, data controller or authorising instrument published. The cameras were not on record at the window's opening. They are now described as standard issue for the national police and road-safety officers, in routine use in central Djibouti with visible wearing and notification protocols and manual or automatic triggers. The account is the state daily's and is framed as reassurance. No retention period, access rule, data controller or authorising instrument is published, and no prior authorisation for the fleet is on record under the regime the Digital Code requires for biometric processing. A biometric-capable surveillance capability entering routine use while its supervisor cannot be shown to exist is the readiness position.	REGRESSED
Regional collaboration	Regional policy collaboration	The country hosted a continental private-sector forum that adopted a Djibouti Declaration on digital trade in December 2025. 2025-10-06 - a three-day regional consultation in Arta on an information sharing and analysis centre advanced a regional cyber-threat mechanism aligned to the continental convention. 2025-12-08 - the 16th African Union Private Sector Forum, held in Djibouti, adopted the Djibouti Declaration on digital-trade implementation, data-protection and cybersecurity alignment, digital public infrastructure and interoperable payments. 2026-06 - senior policymakers joined a regional data-governance workshop in Nairobi drafting harmonised regional data-policy roadmaps. Standing behind these, the regional health data-sharing framework of 2022 is non-binding and its domestication is not evidenced complete. 2024-12 - the regional health-data framework produced hardware: computing equipment was handed to the health ministry for three cross-border health facilities, district health offices and the ministry's health information system, under a European Union digital solutions project implemented by a German development agency, distributed across all member states to strengthen regional disease surveillance. No equipment count or value is published.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Regional collaboration	Regional legal harmonisation	The country signed the United Nations cybercrime convention in Hanoi in October 2025, having ratified the continental convention in 2023. The continental convention on cyber security and personal data protection was ratified in November 2023 and is unchanged. 2025-10 - the country signed the United Nations Convention against Cybercrime in Hanoi as one of seventy-one signatories; no ratification instrument is on file. Both are ratified or signed by a state whose own data-protection supervisor is unevidenced, so the harmonisation is at treaty level and has no domestic enforcement body the base can point to.	ADVANCED
Regional collaboration	Shared regional infrastructure	A tripartite agreement for a terrestrial fibre corridor to Ethiopia and Sudan was signed on 4 February 2026. 2025-08-28 - the national operator announced a southward extension of its regional express cable from Mombasa to Durban, with new landings in Tanzania, Mozambique, Madagascar and South Africa, service-ready 2028. 2026-02-04 - the Ethiopian, Djiboutian and Sudanese operators signed a tripartite agreement for the Horizon Fiber corridor, a terrestrial multi-terabit route connecting the Djiboutian and Sudanese landing stations through Ethiopia, building on a December 2024 memorandum. The operator's own account puts 13 submarine cable systems, ten of them operational, reaching 90 countries. Neither new route carries a stated capacity price or access condition for neighbouring states on file.	ADVANCED
Regional collaboration	Cross-border data transfers	Transfer rules entered force with the Digital Code in September 2025 and a regional pilot mechanism is under preparation. The Digital Code's articles 99 to 103 control international personal-data transfers by adequacy finding or authorisation, in force from 18 September 2025 where nothing stood before. 2025-09 - a regional integration project mission records the July 2025 ministerial call for the two regional bodies to pilot a trusted cross-border personal-data-flow mechanism within twelve months, with a technical working group on data protection and cross-border data. No adequacy finding, authorisation or transfer decision has been published, and the regional health data-sharing framework remains non-binding.	ADVANCED
Standards	National interoperability standards	The national interoperability framework sets the standards layer; no technical specification or conformance register is held. The framework defines a technical interoperability layer and a semantic layer, and provides for governance-level standards and specifications maintained by the state information-systems agency. What is not on file is the layer below it: no published technical specification, data-exchange schema, application-programming interface catalogue or conformance register. The one system in the period described as exchanging data to a stated pattern is the national mobile identity service, where partner administrations query authentication server-to-server without direct access to the biometric database - an architecture stated by its owner rather than a published standard.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Standards	National quality standards	The standards agency operationalised two technical standardisation committees in 2025, its first sectoral standards capacity on file. The agency is the national reference body for standardisation, metrology, certification, accreditation and quality promotion, organised by decree in 2022. 2026-01-13 - the Council of Ministers records that two technical standardisation committees, for agri-food and for electrical and household products, were operationalised during 2025, and approves a 2026 budget of 134.9 million FDJ against 112.1 million in 2025, including 54.4 million of investment for laboratory equipment, software and instrumentation. The agency's two founding laws are not held, and no standard published by the committees appears on file.	ADVANCED
Standards	Adoption of international standards	Risk-management training on an international security standard was delivered to government and critical-infrastructure staff in December 2025. 2025-12-16 - the telecommunications union's regional office delivered three days of ISO/IEC 27005 risk-manager training in Djibouti for government, critical-infrastructure and ICT-sector participants, covering risk context-setting, identification and evaluation. The route by which a standard becomes binding runs through the standards agency, whose technical committees homologate standards by sector and began operating in 2025. No adopted international standard is named in any instrument on file, and no certification or accreditation issued against one appears in the record.	ADVANCED
Public debate and participation in policymaking	Non-governmental contribution to national policy	Four dated consultations in the period took non-government participants into policy formation, from the development plan to the AI strategy. 2025-08-06 - a regional consultation at Dikhil for the third national development plan brought elected officials, local authorities, civil society and experts into the plan's formulation, each region required to produce a validated contribution report. 2025-10-06 - co-design workshops with producers, extension agents, community radios, associations and private-sector actors produced an editorial and data-governance framework for digital agricultural advisory services. 2025-12-06 - a validation workshop at Tadjourah reviewed the draft national land policy with ministries, regional authorities and national institutions. 2026-01-22 - a national AI-strategy workshop of about eighty participants included academia alongside government, the United Nations, the private sector and civil society.	ADVANCED
Public debate and participation in policymaking	Open discussion of government policy	The President publicly set out the risks of the national digital identity system, and the Digital Code was discussed outside government. 2025-11-06 - the ministry presented the newly adopted Digital Code to a France-Djibouti business assembly, its legal adviser setting out the personal-data and electronic-commerce provisions. 2026-02-09 - closing the national digital identity forum, the President addressed identity theft, cloning, hacking, espionage and over-centralisation alongside the benefits, and called for continuing public vigilance. The setting bounds what this shows. A country panel dated April 2026 records the 1992 communication law as never substantially reformed and places the country 167th of 180 on the press-freedom index; the discussion on file is government-convened.	ADVANCED

Finance

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Domestic budget appropriations and expenditure	Sustainable domestic financing of digital transformation	The digital agency's 2026 budget was approved at 396,120,056 FDJ, down from 556.7m the year before. No domestic digital appropriation was held at the window's opening. 2025-12-30 - the agency's 2026 budget was approved at 396,120,056 FDJ, down from 556.7m FDJ in 2025, with investment of 108.1m FDJ for application firewalls, an archiving system, datacentre colocation and support renewal on the data-exchange layer, the balance largely staff costs. That is the agency's whole operating budget rather than a purpose-matched digital line, and the digital-specific component is the investment figure. No separate ministry line or e-government envelope is published, and the budget law itself carries digital obligations without appropriating against them. The arrete is not published, so a Council of Ministers record is the strongest evidence reached.	REGRESSED
MoUs and other agreements	Strategic relationships	A tripartite fibre agreement with the Ethiopian and Sudanese operators was signed in February 2026; no sum is stated in it. The standing relationship on file is with a platform foundation: a memorandum signed on 9 December 2024 to deploy an open-source service platform, including a construction-permit system, with capacity-building and knowledge transfer. 2025-09-21 - an Ethiopian payments operator and a Djiboutian financial-services provider signed a partnership on cross-border payments, remittances and merchant services, witnessed by four ministers. 2026-02-04 - the three national operators signed the tripartite Horizon Fiber agreement. None of the three states a committed amount, so what any of them is worth is not established here.	ADVANCED
New investments	Mobilisation of non-state finance	A startup fund of funds is provided for in the Startup Act, with no implementing decree and no capital committed. The fund did not exist at the window's opening. It is now provided for at articles 25 to 28 of the Startup Act, with the management company to be tendered, no implementing decree and no capital committed. It is the only instrument on this ledger addressed to mobilising non-state money for digital ventures, and it stands where the whole Act stands: in force, with every operative detail deferred to decrees that have not been made.	ADVANCED
New investments	Development-partner project financing	Three lender commitments stand with no implementation report held for any of them. A US\$20,000,000 economic and financial governance project is committed with no implementation report held, and US\$11,422,000 for higher-education digitalisation likewise. Both are year-precise and stated in dollars by the financier. Submarine cable financing runs to US\$55.7m across two projects, US\$16,844,185 in 2015 and US\$38,830,000 in 2019, with no disbursement record held, the earlier one a regional submarine telecommunications project. Nothing moved on any of the three in the window, and no recipient-side account of any of them is on file.	NO CHANGE

ICT Infrastructure

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	Mobile penetration	The incumbent's statutory monopoly stands under two laws, with no competing licensed operator. The monopoly is restated in the operator's own profile and no competing licensed operator exists, unchanged at both ends of the window. The profile's cable and capacity figures are stale and are not carried here. No subscriber count, penetration rate, coverage figure or tariff is published by the operator or by any regulator, for any date in the window. A country carrying a substantial share of the world's submarine cable traffic publishes no measure of how many of its own people are connected.	NO CHANGE
Connectivity	Internet usage	65.30% of the population used the internet in 2024, the latest observation on file and one predating this period. The standing series puts internet use at 65.30% of the population in 2024, against 63.78% in 2022 and 59.93% in 2020. No observation dated inside this period has been published, so the figure at both ends of it is the same one. 2026-03-01 - in his general-policy speech the Prime Minister put mobile-internet penetration at 56.7%, up from 42.5% five years earlier. That is the government's own figure, on a different measure, with no published series behind it. Neither the regulator nor the operator publishes a subscription or usage series on file.	NO CHANGE the latest observation predates the period
Connectivity	Mobile affordability	No national price figure is held; the first authorisation to a competing operator was granted in March 2026. This is a searched absence. The telecommunications union's annual reference publication introduces a data-only mobile broadband basket and reports a global median of 1.4% of income per head, with 130 of 205 economies inside the 2% benchmark; the country's own basket figure sits in the union's price database rather than in the report, and is not held here. What did move is the market. 2026-03-22 - the regulator authorised a new entrant to build and operate a national wired electronic-communications network, market internet access and data transmission, and access the incumbent's landing stations, the first such authorisation against a statutory monopoly. No tariff effect is on record.	ADVANCED on market opening rather than on any published price
Connectivity	National fibre backbone	A binding agreement for a 2,800 km terrestrial corridor to Addis Ababa and Port Sudan was signed on 4 February 2026, from a memorandum only. The corridor stood at a memorandum of understanding in December 2024. 2026-02-04 - a binding agreement was signed in Djibouti covering about 2,800 km, 144 fibre pairs and about 14 ms latency, reported across the trade press. No service date is published, and the route and latency figures are the three operators' own. Domestically, the fibre programme moved from the Ali-Sabieh regional hospital connected and over 200 km deployed in June 2025 to a school, sub-prefecture and clinic at Damerjog connected in October 2025, with a stakeholder and grievance workshop covering the capital, Balbala and the five interior regions.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Connectivity	International internet bandwidth	Twelve submarine systems land in the country, carrying about 18% of international submarine cable data, and a southern extension is under build. Twelve operational systems were reached by the two carrier-neutral facilities in June 2025, and twelve now land, six of them connected to Italy, carrying about 18% of international submarine cable data. Both counts are the reporting parties' own; no landing register is held. 2025-09 - a southern extension of the regional cable was announced at 36 Tbit/s over about 3,200 to 3,500 km, ready for service in 2028, reported across three outlets. 2026-08-03 - an Italian cable inspection and protection project at the landing station was reported during a ministerial mission, under a memorandum with the finance ministry and with no amount, term or delivery date.	ADVANCED
Connectivity	Internet Exchange Points	Two exchange points operate, a national one and an international operator's, both unchanged in the window. The two exchanges are in operation, a national point and one run by an international exchange operator alongside it, the second launched with a carrier-neutral facility expansion. Nothing moved in the window. No traffic figure, member count or peering policy is published for either, so what they carry is unknown - which is the same gap that sits under the country's whole transit position, where the landing count is published and the capacity is not.	NO CHANGE
Connectivity	Satellite broadband licensing and availability	The incumbent's chief executive states there is no clear regulatory framework for new entrants; no licensing decision is on file. The position is unchanged at both ends: the incumbent's chief executive states there is no clear regulatory framework for new entrants, and no licensing decision is on file. It is a cited absence rather than an unexamined one, and it is stated by the party the absence protects. No application, refusal, consultation or draft framework for satellite market entry appears anywhere on this ledger, in a country whose interior regions the domestic fibre programme is still reaching one facility at a time.	NO CHANGE
Data Storage	Local data centre capacity (all providers)	The Tier III facility and cable landing station inaugurated in November 2024 is in service; a second joint venture has not moved. The facility was inaugurated on 25 November 2024 and is in service, unchanged through the window, with no capacity, utilisation or tenant figure published. A data centre joint venture between an operator and the sovereign fund was announced with no construction on record, and its stated first phase of 2026 is unverified; the 50,000 square feet, 5 MW and US\$50m figures are the parties' own. Nothing on file since the announcement.	NO CHANGE
Data Storage	Local data centre capacity (national providers)	A US\$1.35bn memorandum for an artificial-intelligence compute centre and special economic zone was signed on 19 July 2026, valid one year. The project did not exist at the window's opening. 2026-07-19 - a US\$1.35bn memorandum of understanding was signed, valid one year, with no investment protocol, no disbursement and no site, set out by the signing minister and presented as an innovation-pole partnership. The stated 100 MW capacity is the promoters' own, and no feasibility study or site is on file. It is by an order of magnitude the largest figure on this ledger, and it is a one-year memorandum.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Storage	Off-site backup capacity	A disaster-recovery site for the national payment system is contracted; no general government backup arrangement is on file. The one arrangement on record sits under the central bank: an implementation completion report records that the bank established the primary payment-system data centre and contracted the national operator to host the system's disaster-recovery back-up site. Nothing dated inside the period changes it. The central government data centre is in operation with many public entities still on separate infrastructure, and no continuity plan, replication arrangement or recovery objective for state systems generally appears on file. The terrestrial fibre corridor agreed in February 2026 improves route diversity, which is capacity for backup rather than backup itself.	NO CHANGE
Energy	Sufficient energy and water for data centres	Up to 500 MW of solar, wind and storage is provided for in the compute-zone memorandum; nothing is contracted or built. No generation for digital infrastructure was on record at the window's opening. The memorandum provides for up to 500 MW of solar, wind and storage, with nothing contracted or built, the figure being the promoters' own and restated in the signing minister's account. It is the only energy statement attached to digital infrastructure in this country's record. No measured load, tariff, grid-connection arrangement or efficiency figure is published for the facilities already operating.	ADVANCED
Energy	Grid reliability	Supply interruption stands at a 2022 baseline of 9.37 hours per customer against a 2027 target of seven. The development bank's mid-term country strategy review is the only reliability measure on file: 9.37 hours of interruption per customer per year in 2022, a 2027 target of seven hours, roughly 65% of electricity imported from Ethiopia and 20% from the Ghoubet wind farm, with the second interconnection intended to improve reliability reported as delayed. 2025-11-24 - the contract for the 230 kV double-circuit line from Semera to the Galafi border point was awarded; the works are at construction stage and completion has moved to November 2028. No annual reliability series is published, so whether the 2022 figure still holds is not established.	NO CHANGE the latest measured figure is a 2022 baseline
Energy	Rural electrification	A national energy compact validated in May 2026 puts rural access at 17.8% and targets universal access by 2035. 2025-09 - a 165 kW off-grid solar plant with 500 kWh of storage was inaugurated at Adailou in Tadjourah, bringing first-time electricity to about a hundred households and to schools, health facilities and businesses, the energy minister present. 2026-04-21 - a Japanese-funded pilot was launched for two further underserved villages, Yoboki and Omar Jaggaa, linking electricity to water access and community maintenance. 2026-05-25 - the national energy compact was validated, recording rural access at 17.8% and near 30% of the population without electricity, with targets of 60% rural access by 2030 and universal access by 2035 against a stated investment need of \$1.745bn. Nothing on file states what is funded.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Technical Capacity	Robustness of government hardware and software	A pilot connecting 33 government bodies is under way, on a central data centre already in operation. The standing position is a central government data centre in operation while many public entities remain on separate infrastructure. 2026-02 - a World Bank supervision report records the pilot phase connecting 33 ministries and agencies, eleven in the capital and 22 in the regions, under way but incomplete, with a generalisation phase targeting about a hundred more; overall implementation and objective ratings moderately satisfactory and overall risk high. The fibre network beneath it reached Damerjog in Arta during the period. No availability, uptime or incident measure for government systems is published.	ADVANCED
Technical Capacity	Local capacity to maintain, manage and develop government systems	A project closure report finds local capacity a persistent constraint, while training programmes were launched in the period. 2025-06-16 - the completion report on the public administration modernisation project, judging results at closure rather than at design, finds limited familiarity with complex IT contracts and project management, difficulty retaining technical consultants under salary-budget limits and weak supervision of international vendors, with capacity-building to the state information-systems agency producing uneven outcomes - customs modernisation succeeded while the tax system remained non-operational. Against that, three days of international risk-management training were delivered to government and critical-infrastructure staff in December 2025, and an \$8m skills programme was launched in November 2025 around a coding campus and regional digital houses. Both are inputs; no retention or staffing figure for state IT is published.	MIXED training programmes launched against a closure report finding capacity a persistent constraint
Cybersecurity	National cybersecurity readiness	A statutory cyber authority became operational in December 2025, and its response team took part in a regional exercise. There was no statutory cyber authority at the window's opening, only a pre-statutory label and a directorate inside the digital agency. A law carried in the official journal of 15 December 2025 created an autonomous public establishment under the Presidency, operational from December 2025 with a director-general named, after the bill advanced in November. 2026-06-26 to 30 - its incident response team took part in a regional exercise and is reported to have placed first in both simulation scenarios; the placing is the state daily's and the organiser has published no result. The 2024-2030 five-pillar strategy is unchanged.	ADVANCED

DPI

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Exchange	National data exchange system	A prices database and central-administration data-exchange platform was ordered by article 38 of the 2026 budget law, with no design or date. Neither existed at the window's opening. The 2026 budget law orders a prices database and a data-exchange platform on the budget execution directorate, to be established with every central-administration department as the counterpart to a central purchasing body created by the preceding article, with no design, delivery date, budget line or operating rule stated. 2026-07 - real-time identity verification for banks and social protection is named as in preparation by the population directorate, with no date published. Both are ordered or announced rather than built, and the exchange layer the digital agency already runs support on is not stated to be what either would use.	ADVANCED
Data Exchange	Use of digital id in other systems	Real-time identity verification for banks and social protection is in preparation with no date published. The statutory reach is wide: the identification number is compulsory on property, hospital, school, university, utility and commercial records and for third-party data exchange. 2026-02 - the mobile identity system began offering authentication to partner administrations. 2026-07 - the population directorate names real-time identity verification for banks and social protection as in preparation, with no date published. What is missing is any record of a system actually consuming the identity service. The social registry's own interoperability upgrade with the state information-systems agency is reported as work in progress, not as a connection made.	ADVANCED
Data Exchange	Interoperability of health systems	The health information system is under review with resources still being sought to revamp it; no exchange with other sectors is evidenced. The health agency's own management response records that the health information system has limitations, that the reporting platform is under review and being enhanced, and that resources are still being sought to revamp the data system and ensure data connectivity at national level. Beneath it, 69% of health facilities entered data directly into the platform by the end of 2024, with others submitting on paper, and 23 of 62 facilities were connected to the logistics information system against a 65% target. The one exchange on file is internal: medical records shared between hospitals over the state fibre network at Ali-Sabieh, with no further site reported.	NO CHANGE
Data Exchange	Interoperability of education systems	The ministry made consolidating its two education platforms into one sector information system a stated priority for 2025-26. 2025-09-02 - the start-of-year circular makes consolidation of the education information system through the two platforms a strategic priority, aimed at reliable regularly updated data, identifying at-risk pupils and evidence-based decisions. 2025-11-20 - the education minister reports the system in operational use, with more than 3,000 at-risk pupils identified and supported through it. The consolidation is inside the sector. No exchange between education and civil registration, social protection or health appears anywhere in the record, and no interface or data-sharing agreement is published.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Data Exchange	Interoperability of social protection systems	The social registry's interoperability upgrade with the state information-systems agency is still reported as under way. The registry was undergoing an audit, an operational-manual revision and an interoperability upgrade with the social affairs ministry and the state information-systems agency as the period opened. 2026-02 - the first supervision report since effectiveness records the scaling component had not commenced activities as at 31 January 2026, with implementation readiness only. Nothing states the upgrade completed. Ahead of it, real-time identity verification for social protection is named as in preparation. No connection between the registry and any other system is on record as made.	NO CHANGE
Digital Identity and CRVS	Robustness of system	A biometric national identity card has been issued nationwide since 2025, with mobile enrolment kits. No biometric national identity card was on record at the window's opening. It is now issued nationwide with mobile enrolment kits, capturing fingerprints, iris, photograph and electronic signature against a national identification number held in the register of natural persons, the population directorate describing the register as the spine of a modernised and interconnected administration. No enrolment total, coverage rate or issuance figure is published at any date, so how far nationwide reaches is unestablished - and the prior-authorisation regime the Digital Code sets for national-identifier and biometric processing has no supervisory body on record to have applied it.	ADVANCED
Digital Identity and CRVS	Registration of entire population	A biometric identity card is issued nationwide against a register whose enrolment total has never been published. The statutory basis stands: the register of natural persons is the unique reference for identifying individuals and producing every secure national document, with the identification number assigned from birth and compulsory across public, parapublic and private administration. The card built on it is issued nationwide with mobile enrolment kits where none was on record when the period opened. No enrolment total, coverage rate or issuance figure is published at any date, so how much of the population is registered is not established. The 2024 census counted the population but is a different exercise from registration.	ADVANCED
Digital Identity and CRVS	National maintenance of id and credentials systems	The mobile identity service is run by the Interior Ministry with four domestic bodies, on a register the state maintains by law. The founding law assigns administrative management of the register to the population directorate and technical and security management to the state information-systems agency - the credential system is maintained in-country by statute, not by contract. 2026-02-10 - the mobile identity system was launched by the Interior Ministry with the digital economy ministry, the network operator, the cybersecurity authority and the state information-systems agency, the biometric data held only by the Interior Ministry. No maintenance contract, vendor arrangement or key-management rule is published, so what the state runs itself and what it buys is not established from the record.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Identity and CRVS	Authentication	A mobile digital identity platform entered service on 9 February 2026, carrying authentication and electronic signature. The platform did not exist at the window's opening. 2026-02-09 - it was launched at a national digital identity forum, in service for authentication and electronic signature, with biometric data held only by the Interior Ministry, reported across the trade press and in the biometrics press. Interoperability with driving-licence and health records is stated as planned rather than delivered. No activation count, service count or transaction figure has been published since launch, so what the credential is used for is unknown.	ADVANCED
Digital Identity and CRVS	Digital id from birth	The identification number is assigned from birth by law; civil registration that would trigger it stays largely paper-based. The rule has stood since before the period: the founding law assigns the national identification number from birth, and its implementing decree defines it as a digital instrument combining civil-status and personal data and requires it on property, hospital, school, university, utility and commercial records. What the base does not hold is the mechanism. A comparative regional report finds no electronic records in local civil-registration offices for births or deaths, no central national civil-registration database, and paper-based transmission between registration levels and institutions. No birth-registration rate, and no count of numbers assigned at birth, is published.	NO CHANGE
Digital Identity and CRVS	Interoperability of birth registration and digital id	Civil-registry archive digitisation is under way with no completion date; the link to the identity register is not evidenced. The law provides the link in principle - the register of natural persons is the source for every secure document and the land register may cross-check identity documents against the national population database. In practice a regional survey finds no central civil-registration database and fully paper-based exchange between registration levels and institutions. The one movement is preparatory: archive digitisation at the population directorate is under way, with no completion date published. No interface between civil registration and the identity register appears in the record.	NO CHANGE
Digital Identity and CRVS	Use by other systems	The mobile identity system authenticates for partner administrations server-to-server, without exposing the biometric database. Nothing of the kind existed when the period opened. 2026-02-10 - the mobile identity system was launched with biometric authentication, partner administrations querying the authentication service server-to-server rather than reaching the biometric databases directly, positioned as complementary to the identification number and civil-registry modernisation. Closing the forum that launched it, the President set out identity theft, cloning, hacking, espionage and over-centralisation as the risks alongside the benefits. No relying party is named, no service is on record as connected, and no authentication volume is published - the architecture is stated by its owner and not evidenced in use.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Payments and Fintech	Governance role of central bank	The central bank licenses and supervises every payment service by law and operates the settlement system itself. The 2016 law applies to every payment service and system operated in the country and empowers the central bank to license, regulate and supervise payment-system providers, defining electronic money and electronic funds transfer. The bank is also the operator: the settlement platform combining real-time gross settlement and automated clearing has run since 15 July 2021, with the Treasury among its participants. It acts by instruction rather than by statute - from 31 August 2025 non-conforming cheques were refused by the platform and legacy stock withdrawn. No supervisory decision, licence register or sanction is published.	NO CHANGE
Digital Payments and Fintech	G2P functionality	The state personnel file was ordered updated by article 32 of the 2026 budget law to integrate contract staff and unregularised headcounts. The file existed and its position at the window's opening is not held. The 2026 budget law orders the budget ministry, jointly with the labour ministry charged with administrative reform, to update the database to integrate contract staff and headcounts awaiting regularisation, with no completion date, budget line or headcount stated. A payroll database that a finance law has to order updated to include the staff already being paid from it is the position as the base holds it. No count of records, no audit and no remediation report follows it on file.	ADVANCED
Digital Payments and Fintech	Revenue collection	Electronic customs clearance and payment are now obligatory while the tax system collects nothing. On the customs side the 2026 budget law constitutes the single window by statute, makes the electronic route obligatory for all economic operators with paper admitted only on a duly established technical impossibility, requires duties, taxes and fees to be paid electronically and requires the customs and treasury systems to be interconnected for daily and monthly reconciliation. On the tax side the share of returns filed and paid through the integrated system stood at 0% in January 2026 against a 70% target for 2029. Between them the fund's consultation records electronic payment introduced for vehicle road tax, stamp duty and licensing fees, short of an operational tax system.	MIXED customs collection made obligatory while the tax system stays non-operational
Digital Payments and Fintech	B2B and B2G functionality	The settlement platform has combined real-time gross settlement and automated clearing since 2021, the Treasury a participant. The wholesale layer is in place and unchanged across the period: the central bank's platform combines a real-time gross settlement system and an automated clearing house, covering interbank settlement with the Treasury among the participants - the route by which a business pays a bank or the state. The one measure inside it is a tightening of instruments rather than of function: from 31 August 2025 cheques had to meet new format, security and encoding standards or be refused by every clearing channel. No transaction volume, value or participant list is published, and no electronic-invoicing or government payment portal appears in the record.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital Payments and Fintech	P2P, P2G and P2B functionality	The mobile wallet has been in service since June 2020, but the national instant payment system was moved from operational to in development. The wallet has been in service since June 2020, with an online payment gateway launched under the Prime Minister's patronage on 10 December 2023 and extended to the ports. Neither moved in the window and no subscriber, wallet or transaction figure has ever been published for either. The conventions signed on the gateway's launch day are named by category only and are not held. Both are the incumbent's, in a market with no competing licensed operator. The standing position was corrected downward by an external observer. The 2024 continental instant-payment landscape records that earlier reports listed the national system as operational, but funding has been secured for a payment switch and an instant payment service is not live, so the country no longer meets the inclusion requirements and has been moved to the list of systems in development. The central bank has published nothing correcting the earlier position either way.	REGRESSED the national instant payment service reclassified out of the operational landscape
Digital Payments and Fintech	Population uptake	A memorandum for a national digital wallet was signed on 16 September 2025, targeting a 60% cut in cash use. Nothing existed at the window's opening. 2025-09-16 - a memorandum was signed with a card network and a biometrics supplier for a national digital wallet, with nothing in service and no rollout calendar. The stated target of a large cut in cash use within three years is the parties' own. No baseline cash-use figure, account count or transaction volume exists anywhere on this ledger to measure it against, and the wallet already in service publishes none either - so the country's payment uptake is stated only as an ambition.	ADVANCED
Digital Payments and Fintech	Cross-border functionality	A cross-border payments partnership with an Ethiopian operator was signed in September 2025; nothing is in service on record. 2025-09-21 - an Ethiopian payments operator and a Djiboutian financial-services provider signed a partnership on cross-border digital payments, remittances and merchant solutions, witnessed by the finance, innovation and defence ministers, the startup commissioner and a World Bank representative. 2026-02-11 - the regional body issued terms of reference to develop a harmonised regional payment-interoperability framework covering settlement, clearing, mobile money and fintech gateways, an enabling step rather than an operating arrangement. Neither is in service. No corridor volume, no launch date and no regulatory approval for either appears on file.	ADVANCED
Digital Payments and Fintech	Consumer protection	No payment-specific consumer regime is held: the Code covers data and commerce, the payments law licensing. This is a searched absence rather than an unexamined one. The Digital Code, published on 18 September 2025, carries titles on personal-data protection, electronic communications, cybersecurity and digital services; none of them is a payments consumer regime. The payment-system law confines itself to licensing, regulation and supervision of providers and to defining electronic money. No rule on disclosure, fees, redress or dispute resolution for electronic money or digital payments is on file, and no complaint or redress figure is published by the central bank or any provider.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Registries	Population register	The register of natural persons is the statutory spine of a modernised administration; no enrolment figure is published. The register was created by the 2019 law as the unique reference for identifying individuals, with a national identification number attached, and the population directorate now describes it as the spine of a modernised and interconnected administration. What moved in the period is what runs on it: a biometric card issued nationwide with mobile enrolment kits and a mobile identity service launched in February 2026. The register's own size, completeness and update rule are not published, and the prior-authorisation regime for national-identifier processing has no supervisory body on record.	ADVANCED
Registries	Civil register	Civil-registry archive digitisation is running alongside enrolment, with staffing and archive space named as the constraints. The programme was not on record at the window's opening. It is under way alongside biometric enrolment, with staffing and archive space named as the constraints and no completion date published. No record count, coverage figure or registration rate is held at any date. The directorate that runs it is the same one preparing real-time identity verification for banks and social protection, so a register whose digitisation is constrained by staffing and shelf space is the intended source for those checks.	ADVANCED
Registries	Address register	A national locality directory with resident counts was published in November 2025; no civic address register exists. 2025-11-18 - the statistics institute published a directory of localities and resident populations from the third census, covering every region, commune, district, quarter, village and hamlet - a georeferenced locality reference rather than a street-address register. 2026-01 - a territorial portal was launched combining the census demographic data with national boundary layers. The addressing service a resident can actually use is commercial and postal: a three-word geocoding grid offered by the post office. No addressing law, no naming authority and no register of addresses appears on file.	ADVANCED
Registries	Business register	An online company creation platform was launched by the Prime Minister on 26 January 2026, completing formation without attendance. The platform did not exist at the window's opening. 2026-01-26 - it was launched by the Prime Minister and is in service, with company formation completed without attendance. No registration count through the platform is published. The company-creation and survival figures that accompany the announcement are the investment agency's own study and cover the one-stop counter rather than the platform, so nothing on file measures what the online route has actually done. The register behind that platform is described by its own registrar: a statutory register of the natural and legal persons carrying on commerce, accepting civil companies, professional civil companies, and participation companies which are expressly not registered and have no legal personality. No record count, filing volume or statement of whether the historic stock is digitised appears anywhere in the base.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Registries	Social protection register	The registry held 515,730 people in February 2025 and the scaling to 600,000 had not begun by January 2026. The registry sits at the social affairs ministry, founded by decree in 2017 and amended in 2020, with provisions to include refugees, and held 515,730 people as of February 2025, undergoing an audit, an operational-manual revision and an interoperability upgrade. 2026-02-05 - the first supervision report since the project became effective in August 2025 records the scaling component, targeting growth to 600,000, had not commenced activities as at 31 January 2026. No coverage figure later than February 2025 is published.	NO CHANGE the scaling component effective in August 2025 had not begun by January 2026
Registries	Electoral register	The voter card is produced from the register of natural persons by law; no electoral roll or its size is held. The only statement the base holds is statutory: the founding law makes the register of natural persons the unique reference for producing every secure national document, the voter card among them, alongside the identity card, passport and driving licence. Nothing dated inside the period touches it. What is absent is the register itself: no electoral roll, no registered-voter count, no revision cycle, no instrument governing its compilation, and nothing on whether the identification number has been applied to it. The biometric identity card issued in the period carries no stated electoral use.	NO CHANGE
Registries	Tax register	No taxpayer register is held; the integrated tax system that would carry one collects nothing. The register question turns on a system that does not run. The share of returns filed and paid through the integrated tax administration system stood at 0% in January 2026 against a 70% target for 2029, with the follow-on project's effectiveness extended a third time to 9 March 2026. Its predecessor closed with the tax system non-operational, while customs modernisation succeeded. No taxpayer count, registration figure or register instrument is published. The authorities' plan is to finalise digitalisation and integration of information systems across tax administrations over 2026-30.	STALLED the system that would hold the register is not operational
Registries	Land register	The digitised land books are the register's operative legal form; a national land policy was validated in December 2025. The standing position is a 2018 amendment to the 1991 property law, which gives legal effect to digitised land books and a centralised electronic database as the operative form of the register, requires every registered private parcel to be mapped and recorded, and lets the register cross-check identity documents against the national population database. 2025-12-06 - a validation workshop at Tadjourah reviewed the draft national land policy, covering tenure security, land-use planning and access for women, youth and vulnerable groups. No count of parcels registered or digitised is published, so how much of the territory the register covers is not established.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Sectoral management information systems	Health	A pharmaceutical stock and traceability system was completed across all health facilities in April 2025, while medical record sharing runs at one connected hospital. The service is in operation at the Ali-Sabieh regional hospital over the national fibre network, and no further site is reported. Nothing moved in the window. The before-and-after comparison is the hospital's own account, and no patient volume, record count, standard or governing instrument is published. It is the only health information system of any kind on this ledger, and it covers one hospital. 2025-04 - the supply chain went the other way. The central procurement office for medicines announced completion of mSupply installation across all health facilities, for stock levels, drug traceability and supply planning against stockouts and losses to expiry, as a component of the 2023-2027 national pharmaceutical policy and financed by the World Bank. No facility count, stockout rate or baseline is given against which the completion can be read. 2024-12 - the regional framework supplied hardware rather than systems: computing equipment was handed to the health ministry and allocated to three cross-border health facilities, district health offices and the ministry's health information system, funded by the European Union and implemented by a German development agency.	MIXED a national supply-chain system complete while record sharing sits at one hospital
Sectoral management information systems	Education	The education system is in operational use and every school location was validated by April 2026. At the period's opening the system was deployed to public primary schools with a unique student identifier for real-time enrolment, attendance and dropout-risk tracking, with rural electricity and full adoption still constraints. 2025-11-20 - the minister reports more than 3,000 at-risk pupils identified and supported through it. 2026-02-05 - the project's supervision rating for progress toward its objective rose from moderately satisfactory to satisfactory. 2026-04-27 - the country became the first to validate every school location on the connectivity mapping platform, using imagery analysis for schools missing from administrative records.	ADVANCED
Sectoral management information systems	Social protection	The registry is used to map poverty for targeting; its interoperability upgrade is still reported as under way. The system behind the registry was undergoing an audit, an operational-manual revision and an interoperability upgrade with the social affairs ministry and the state information-systems agency when the period opened, and nothing records it complete. 2026-01-29 - the President names the registry as the basis of the first differentiated geographic and social mapping of poverty, enabling a shift from scattered interventions to targeted social policy; the development agency reports 93,759 households, about 525,000 people, supported by the safety-net programme over 2018 to 2026. No payment, case-management or grievance system attached to it appears on file.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Sectoral management information systems	Justice	A case-management pilot for minor offences is under construction; the legal-information platform matured instead. The court system itself has not moved. The development programme's own account records a digital-readiness assessment, process mapping, a vision for electronic justice and a pilot case-management system for minor offences under construction, developed with judges and court administrators, with a centralised judicial-statistics system already launched. No founding instrument for any of it is held. What did move is the layer around it. 2026-03-26 - the electronic official journal has become a public legal-information platform, with over a century of laws, decrees and administrative acts searchable online and 2,000 to 2,500 consultations a month. A joint mandate to digitalise legal services was assigned by decree in June 2026.	NO CHANGE
Sectoral management information systems	Tax	The integrated tax system collected nothing through it in January 2026, five years after the first project began. The predecessor project closed with the tax system non-operational while customs modernisation succeeded, against a background of limited familiarity with complex IT contracts and difficulty retaining technical consultants. 2026-01-27 - the follow-on project inheriting delivery records its effectiveness extended a third time to 9 March 2026, pending recruitment of implementation staff, and the share of returns filed and paid through the system at 0% against a 70% target for 2029. The authorities' own plan is to finalise digitalisation and integration across tax administrations over 2026 to 2030.	STALLED delivery passed to a follow-on project whose effectiveness has been extended three times
Sectoral management information systems	Customs	The customs system was constituted by statute as the single window, with the electronic route obligatory for all economic operators. The customs clearance system was in service as a governance case study. The 2026 budget law constitutes it as the single window under the customs directorate, centralising the declaration, certificates of origin, licences, freight manifests, control results and sanitary and phytosanitary certificates; the electronic route is obligatory for all economic operators with paper admitted only by derogation on a duly established technical impossibility, duties and taxes are paid electronically, and the customs and treasury systems must be interconnected for daily and monthly reconciliation of collected revenue. The port community system remains the mandatory national platform for import, export and transit data and was presented as a best-practice example at a regional seminar in April 2026; no transaction volume is published for either.	ADVANCED
Sectoral management information systems	Land	A geospatial capacity project closed in December 2025 delivering an enterprise server, drones and positioning equipment. 2025-12-09 - the urban and infrastructure ministries closed a capacity project on geospatial data sharing and information management, delivering a national enterprise geographic-information server, drones, satellite-positioning equipment, a large-format printer and specialised software, with national teams trained. The register it serves is the digitised land book system given legal effect in 2018. Alongside, an urban rehabilitation project's closing date was extended by twelve months to complete land-tenure regularisation in informal settlements. No parcel count, coverage figure or link between the geospatial platform and the register is published.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Other GovTech and e-Gov	e-government services	A business platform entered design in December 2025, and the state archive programme signed an accord in August 2026. 2025-12-15 - a design phase was launched for an integrated business platform on three pillars: a startups portal, a government-to-business counter and an extension of the one-stop counter, reported the same week. Nothing is reported built. The archive programme has run state-funded since 2023 with over 200,000 secured digital files for the Presidency, and signed a letter of accord with the UN development programme on 2 August 2026 extending it to the audit and integrity institutions from September 2026. The accord's text, value and duration are not stated, and delivery is asserted by the parties at signature rather than independently measured.	ADVANCED

Digitalisation

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digitalisation of sub-national government	ICT infrastructure for local government	A pilot connecting 33 government bodies, 22 of them in the regions, is under way. 2025-10 - the state fibre network reached Damerjog in Arta, adding a school and a sub-prefecture, after a stakeholder workshop covering the capital, Balbala and the five interior regions. 2026-02 - the supervision report puts the pilot at 33 ministries and agencies, eleven in the capital and 22 in the regions, under way but incomplete, with a generalisation phase targeting about a hundred more. 2026-03-25 - the Interior Minister met the World Bank resident representative on additional financing for the project, its objectives and its results framework. Nothing states which regional council or commune is connected, or with what.	ADVANCED
Digitalisation of sub-national government	Digitalisation of local government records	Civil-status administration passed to the Dikhil regional council at Mouloud in April 2026; nothing states it was digitised. 2026-04-27 - civil-status administration was formally transferred from the prefectural administration to the Dikhil regional council at a ceremony in the sub-prefecture of Mouloud, bringing the service closer to a rural population. The account documents territorial decentralisation and says nothing about digitisation. At the centre, archive digitisation at the population directorate is under way with no completion date published. A regional survey finds no electronic records in local civil-registration offices and paper-based transmission between levels. No local-government record system appears anywhere on file.	ADVANCED on decentralisation rather than on digitisation
Rural digital data capture	Digitalisation of rural health clinics	69% of health facilities entered data directly by the end of 2024; the rest still submit on paper. The measured position predates the period and nothing inside it moves: by 31 December 2024, 69% of health facilities entered data directly into the reporting platform while others submitted on paper, and 23 of 62 facilities were connected to the logistics information system against a 65% target. The health agency's own response records the system under review and resources still being sought to revamp it and ensure connectivity at national level. 2025-08-29 - the health ministry joined a regional ministerial meeting committing member states to community and cross-border surveillance, unified digital data repositories and interoperable laboratory systems - a commitment, not a deployment.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Rural digital data capture	Digitalisation of rural primary schools	Every school location was validated by April 2026, the mapping reaching schools missing from administrative records. 2025-12-16 - more than 80% of schools had been mapped, with imagery analysis being applied to locate the remainder, coordinates and pupil counts having previously been extracted by hand. 2026-04-27 - the country became the first to validate 100% of school locations on the connectivity mapping platform, addressing rural and hard-to-reach schools missing from administrative records or lacking precise coordinates. What the data supports is planning rather than provision: the education system is deployed to public primary schools while rural electricity access remains limited and full adoption is still in progress. No count of connected schools is published.	ADVANCED
Rural digital data capture	Digitalisation of rural registry offices	A regional survey finds no electronic records in local civil-registration offices and paper-based transmission between levels. The standing position is set out in a country-comparative survey: no electronic records in local civil-registration offices for births or deaths, no central national civil-registration database, paper-based marital-status registration and fully paper-based transmission between registration levels and institutions, despite open-source registration software being in use centrally. The one movement is administrative: civil-status administration was transferred to the Dikhil regional council at Mouloud in April 2026, with nothing said about equipment or records. Archive digitisation at the population directorate is a central programme with no stated reach into regional offices.	NO CHANGE
Rural digital data capture	Digitalisation of rural police stations	No station-level deployment is on record; the project that would have connected them dropped its identity component. This is a searched absence rather than an unexamined one. The independent evaluation of the public administration modernisation project records that its interoperable platform aimed to connect ministerial systems including tax, customs, justice, birth certificates, driving licences, education, health and budget, and that at the 2022 restructuring the digital-identification component was dropped and the citizen service centre pilot reduced in scope; it provides no evidence that police stations were connected, equipped or capturing records digitally. Nothing dated inside the period changes it, and no station count, equipment list or connectivity figure for the police appears anywhere on file.	NO CHANGE

Technology

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
AI	Use of AI in government administration	Strategy work began in January 2026 and an AI weather system runs in a public agency. 2026-01-22 - the digital economy ministry opened preparatory diagnostic work on a first national artificial-intelligence strategy; the strategy is complete and the forum it was set to launch at opened on 2 September 2026. The one system running inside the administration is the meteorological one: version 2.0 entered service in July 2026, forecast resolution improved from nine kilometres to three with three-day forecasts refreshed six-hourly, after the first deployment was commissioned in December 2025. 2026-07 - the communications minister took the administration-modernisation agenda to two summits in Geneva.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
AI	Use of AI in sectoral management information systems	A weather early-warning system entered service in version 2.0, forecasting at 3 km resolution against 9 km. The first system was supplied in July 2025 and not yet in service. 2026-07 - version 2.0 was handed over on the sidelines of a Shanghai conference and is in service, with forecast resolution of 3 km against 9 km, a three-day horizon and six-hourly updates. It is supplied by the Chinese meteorological administration throughout. No accuracy assessment, warning count or user figure is published, and it operates in a country where no instrument governs artificial-intelligence systems in public use - so an early-warning system on which safety decisions rest has no published audit route.	ADVANCED
AI	Development of national / regional AI systems	A cross-border data corridor is provided for in the compute memorandum, against a readiness score of 24.5 out of 100. The corridor did not exist at the window's opening. It is provided for in the compute memorandum and named by the signing minister as a success indicator, stated alongside full national jurisdiction over data generated on the territory, with nothing built; the memorandum text is not held. The national readiness position is an estimated 24.5 out of 100 on a diagnostic described as an emergent level, against an information and communication technology development index of 61.6 attributed to the submarine cables landing here and to the data centres. The assessment report is not held and neither index's methodology is named, so the gap between the two scores is the finding rather than either number.	ADVANCED
AI	Control of AI abuse	No artificial-intelligence instrument exists; the Digital Code's data and cybercrime provisions are what reaches such abuse. This is a searched absence. The Digital Code regulates personal data, electronic communications, cybersecurity and cybercrime - the operative framework capable of reaching abuse through an artificial-intelligence system, with no provision addressed to such systems as such. 2026-01-22 - a consultative workshop discussed and refined the draft national strategy, covering data governance, digital sovereignty and ethics ahead of adoption; the strategy was still in draft. No procurement rule, transparency duty, impact assessment or oversight body for automated decision-making in public administration appears on file.	NO CHANGE
ICT Industry	National capacity in DT-related production	A national federation of digital enterprises was reported created in December 2025, with no constitution published. The federation did not exist at the window's opening. Its creation was reported in December 2025, as a founding member of a continental federation under a declaration signed at Marrakech, with no constitution or membership published. Nothing since reports a member count, a statute, an office or an activity. It is the only industry body on this ledger, in a market where the sole telecommunications operator holds a statutory monopoly and no sector revenue, employment or firm-count figure is published by anyone.	ADVANCED
Innovation ecosystem	Technology hubs	An innovation platform was launched by the digital economy ministry in July 2026, with no user or service figures. The platform did not exist at the window's opening. 2026-07 - it was launched by the Minister Delegate for the Digital Economy and Innovation, with no user or service figures published. The account is trade press reporting a ministry announcement, and the platform is distinct from a private marketplace of the same name. No incubator, accelerator or technology park appears anywhere else on this ledger, so a ministry-run platform with no published usage is the whole of the country's hub provision.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Innovation ecosystem	Tech startup ecosystem	The Startup Act is in force from promulgation with every operative detail deferred to implementing decrees, and none is held. The Act did not exist at the window's opening. It was signed on 1 December 2025 and carried in the official journal of 15 December, in force from promulgation with every operative detail deferred to implementing decrees, after advancing through November and being reported across the trade press. No decree is held as at 20 July 2026, so no label award, sandbox admission or visa issue can be stated. The regulatory sandbox at articles 31 and 32 and the startup visa at article 15, a three-year renewable residence card with an automatic work permit are provided for with no admission or issue on record.	MIXED the Startup Act came into force in December 2025 while none of the decrees carrying its label, sandbox, visa or fund has been made

Capacity

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Literacy	Digital literacy (civil service)	A civil-service digital skills programme is running with no completion figures published. The programme was launched with a domestic cloud operator, a vendor university and the national public administration institute and is running, unchanged at both ends of the window. No completion figures, cohort sizes or curriculum are published. It predates the window's opening by five months and nothing since revises it, so a programme in progress with no measured output is the position - which matters because the administration it trains is the one now running biometric enrolment, a mobile identity credential and a statutory single window.	NO CHANGE
Literacy	Digital literacy (general population)	The project component for general digital skills reports no one reached on its own indicator. The instrument is a project component rather than a national programme: the founding document establishes digital transformation and skills development as a component, recording large-scale basic digital-skills training as lacking and most of the population as unfamiliar with digital tools. 2026-02 - the supervision report records the people-using-broadband indicator at zero against a target of 10,000 on its February 2025 reading. The programmes that did deliver in the period are vocational rather than general: 240 completions on a digital-trades course. No digital-literacy rate for the population is published.	NO CHANGE
Training and skills	DT-related training in secondary education	Two STEM centres opened in secondary schools in September 2025 and a vocational digital strategy was validated in November. 2025-09 - two STEM centres opened at the Lycee de Djibouti and the Lycee de Hodane, with computer and electronics laboratories, dedicated mentors and term-time and holiday sessions, the schools providing premises and upkeep. 2025-11-06 - the ministry's national digital-transformation strategy for technical and vocational education was validated at a workshop, on a process opened in May 2025. The ministry carries the mandate under a 2024 reorganisation law covering curricula across public and private schools including secondary, and education infrastructure and equipment. No enrolment figure for either is published.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Training and skills	DT-related university facilities and qualifications	A coding school project was launched with European partners in April 2026, with no intake or opening date published. The school did not exist at the window's opening. 2026-04 - a project was launched with the European Union, a French technical agency and the school's own association, with no intake or opening date published. It is a project rather than an institution: no site, curriculum, capacity or first cohort is on record. Against a national artificial-intelligence readiness score in the mid-twenties and a compute memorandum in the billions, the country's training provision is one announced school and one civil-service programme with no published output.	ADVANCED
Training and skills	Graduates entering DT ecosystem	240 young people completed digital-trades courses in October 2025, the only completion figure on file. 2025-10-21 - 240 young people completed the digital-trades programme in cybersecurity, mobile development and web development, run with an international francophone partner. 2025-11-25 - an \$8m programme was launched to train 3,000 young people and women by 2029, around a coding campus, regional digital houses and support to a chamber of commerce skills centre; the coding school itself is a project with no intake or opening date published. No university graduation figure in a digital field, and no destination or employment figure for any cohort, is published.	ADVANCED
Research institutions	Think tanks and academic departments contributing to DT policy	Academia joined the artificial-intelligence strategy workshop; no research programme in a digital field is on record. This is a searched absence rather than an unexamined one. The sole public university's own regional strategy is structured around training, research and governance, and the text held names no digital or data-science research programme. 2026-01-22 - the national artificial-intelligence strategy workshop of about eighty participants included academia alongside government, the United Nations, the private sector and civil society - the one recorded instance of academic contribution to digital policy. No think tank, no research centre mandate, no funded programme and no published research output in the field appears on file.	NO CHANGE

Inclusion

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Access to services	Citizen feedback portals	A complaint-management portal is in service at the urban rehabilitation agency; its scope is that agency alone. Nothing of the kind was on record when the period opened. The urban rehabilitation agency now operates a complaint-management portal that routes recovery and technical problems to named internal divisions. That is one agency, not a government channel. No whole-of-government feedback mechanism, service-standard commitment or response-time figure is published, and no complaint volume for the portal itself appears on file. The electronic official journal is the other public-facing service on record, and it publishes rather than receives.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Access to services	Citizen participation in policy	The third development plan was consulted across five regions over three weeks, each required to file a validated contribution. 2025-08-06 - the plan's regional consultation at Dikhil formed part of a five-region, three-week process, each region required to produce a validated contribution report feeding the national plan. 2025-10-06 - co-design workshops brought producers, extension agents, community radios and associations into the design of digital agricultural advisory services, including their data-governance arrangements. 2025-12-06 - the draft land policy was reviewed at Tadjourah with regional authorities, covering access to land for women, youth and vulnerable groups. Every one of these is a convened meeting. No standing or online participation channel exists on file.	ADVANCED
Access to services	Gender equity	Two training programmes in the period target women explicitly; no gender-disaggregated access figure is published. 2025-11-24 - the skills programme was launched to train more than 3,000 young people and women by 2029 through a coding campus, regional digital houses and support to business institutions, funded at EUR 7m over four years. 2026-05 - a regional call opened gender-sensitive digital-trade training in mobile money, electronic commerce, digital marketing and financial literacy to women and youth enterprises, with women given application priority. Both are commitments to train. No sex-disaggregated figure for internet use, device ownership, account ownership or public-service use appears anywhere on file. 2026-09-03 - the corridor programme put training against formalisation: forty women traders took export-readiness training at Bishoftu on 30 and 31 July 2026 under a EUR 32m European corridor programme, covering formalisation, product standards, export documentation and customs procedure. The training was delivered on the Ethiopian side of the corridor and no Djiboutian cohort or digital element is separately costed.	ADVANCED
Access to services	Inclusion of persons with disabilities	A skills project trained about 1,500 people on pathways prioritising persons with disabilities, among other groups. 2026-04-20 - the skills development project reports about 1,500 people trained in logistics, construction, energy, hospitality, big data, cybersecurity and other sectors, described as inclusive by design with training pathways prioritising women, refugees and persons with disabilities and adapted support alongside. That is the whole of the record. No number of participants with disabilities is given, no accessibility standard for public digital services is on file, and no assistive-technology provision or accessibility audit of any government platform appears anywhere in the base.	ADVANCED
Access to services	Inclusion of refugees and IDPs	Displaced people were brought into the national household survey through a boosted sample with displacement modules. 2025-09-08 - refugees, migrants and undocumented residents were included in the national household survey through a boosted sample and a questionnaire carrying modules on migration history, access to services, livelihood barriers and integration, with technical assistance to the statistics institute and anonymised microdata planned for release. 2026-05-19 - a technical facility was appraised to improve refugees' and host communities' access to affordable financial services and financial literacy; nothing confirms disbursement or launch. The social registry's founding decree was amended in 2020 with provisions to facilitate refugees' inclusion; no count of refugees registered is published.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Digital divides	Bridging of digital divides	Digital houses were announced across five inland regions, 3,000 to be trained by 2029 at a stated EUR 7m; no site is open. The initiative did not exist at the window's opening. 2026-05 - it was announced across five inland regions, with 3,000 to be trained by 2029 at a stated EUR 7m and no site open on record. Both figures are the programme's own. It is the only instrument on this ledger addressed to the interior. The domestic fibre programme has reached the interior one facility at a time - a regional hospital, then a school, sub-prefecture and clinic - and no rural coverage, penetration or affordability figure exists for the country at any date.	ADVANCED

Data

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
National statistics	National strategy for development of statistics	The third statistics development strategy was validated in April 2025 and has no adoption instrument held. The 2025-2029 strategy was validated at a statistics institute workshop on 29 April 2025 with no adoption instrument held, and the position is identical at both ends of the window. Fifteen months from validation to nothing. No adoption decree, budget, indicator set or first publication under it appears on file, and no statistical output of any kind from the institute is held for the window.	NO CHANGE
National statistics	Censuses and surveys	The census published its definitive results and a second national survey began fieldwork in December 2025. 2025-11-18 - the statistics institute published the census directory of localities and resident populations, covering every region, commune, district, quarter, village and hamlet. 2025-12-31 - fieldwork began across the regions on the seventh round of the household survey on children, adolescents, women and family wellbeing. 2026-01 - the definitive results report of the third census, conducted in 2024 and the first since 2009, was published. The institute's own statistics strategy remains validated with no adoption instrument held.	ADVANCED
National statistics	Statistics from administrative data	A specialised statistical corps was created by decree in May 2026, charged with compiling and projecting national data. The standing instrument is older: the employment observatory's founding decree expressly requires a periodically updated employment and skills database built from diverse administrative sources, the clearest statement on file that administrative records are worked into statistics. 2026-05-12 - a decree created a specialised corps of statisticians, engineers, senior administrators and technicians charged with compiling, analysing and projecting socio-demographic, economic and environmental data. 2026-06-11 - the finance ministry was assigned responsibility for the national strategy on collecting, processing and disseminating official statistics. No output built from administrative registers is published.	ADVANCED

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
Open data	Use of open data	126 years of the legal record were digitised and published online, alongside a standing open-data platform. The open data platform is in service with no dataset inventory or update policy held, access arranged through a development bank, and the national summary data page was launched at the central bank on 12 June 2025 and is published with no update record held. 2026-08 - 126 years of the legal record were digitised and published online. The account gives no date for when publication began, so the position at the start of the period cannot be stated. It is the one substantial publication of state information the window records, and it is a legal archive rather than a dataset.	ADVANCED
Use of satellite data	Agricultural use of satellite data	A regional crop-monitoring consultancy using satellite indices was sought in March 2026, covering Djibouti. The national programme is not an agricultural service: its two nanosatellites collect hydrological and climatological ground-station data, with imaging secondary at about a kilometre per pixel. 2026-03-05 - the regional body sought a consultant to monitor and forecast crop conditions across the region using satellite vegetation and moisture indices, land-surface temperature and rainfall anomalies, feeding regional early-warning dashboards - a regional service Djibouti falls inside rather than one it runs. The sector work on file is advisory rather than observational: co-design workshops on digital agricultural advisory services for Ali-Sabieh and Tadjourah. No national crop or yield estimate from satellite data is published.	ADVANCED
Use of satellite data	Meteorological use of satellite data	A satellite-fed multi-hazard early-warning system was commissioned in December 2025 and upgraded in July 2026. The standing authority is the national meteorology agency, a public establishment and the country's focal point to the world meteorological organisation, operating the observation-station networks and serving aviation, maritime navigation, agriculture and disaster management. 2025-12-18 - a donated multi-hazard early-warning system was commissioned, combining meteorological-satellite remote sensing, exchanged observations and forecasting for port safety, airport weather and city-level heat and wind alerts up to 24 hours ahead. 2026-07-17 - version 2.0 was handed over with a monitoring and alerting terminal completing a sensing, forecasting and alerting chain.	ADVANCED

Geopolitics

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
US / hyperscaler activities	USA / hyperscaler MoUs, engagements and commitments	A new impetus in digital and media cooperation with the United States was reported in September 2026; the standing engagement remains one cable route. The standing engagement is a cable: the hyperscaler's own announcement of the Raman system, with partners, puts Djibouti on a route also serving Jordan, Saudi Arabia, Oman and India, at sixteen fibre pairs. No activation status for the Djibouti landing has been published since. Nothing dated inside the period adds to it. What moved in the period on international connectivity was carrier and regional: the terrestrial corridor agreed with the Ethiopian and Sudanese operators and the southward cable extension. No United States government or hyperscaler memorandum, investment or commitment appears on file. 2026-09-01 — a new impetus in digital and media cooperation between the two governments was reported (report). No instrument, sum or timetable accompanies it, so what changed is that a bilateral digital relationship is now on the record at all.	ADVANCED
China activities	Chinese MoUs, engagements and commitments	An industrial and artificial-intelligence cooperation roadmap was presented in Beijing in June 2026, with no agreement or figure. 2026-06 - a roadmap was presented to Chinese counterparts and an export-import bank in Beijing, with no agreement, instrument or figure. The standing commitment is a grant for an urban security monitoring system, committed and with no implementation record held; its own title and its deal field state different amounts and the two have not been reconciled. The relationship is otherwise visible through delivery rather than instruments: the weather early-warning system in service and the compute memorandum signed in July 2026 both run through Chinese counterparties, and neither is recorded as a bilateral agreement.	ADVANCED
EU activities	EU MoUs, engagements and commitments	The Europe-Africa-India digital corridor was presented in October 2025, centred on a cable landing in Djibouti. The framework is a country partnership financed mainly through the union's external instrument at EUR 82m for 2021 to 2027, covering enterprise digital capacity, digital skills, digitalisation of public services and the Blue Raman cable with Djibouti as a landing point. 2025-08-21 - an assessment of eleven strategic corridors, one running to Djibouti, identifies digitalisation as the hardest investment objective among them. 2025-10-10 - the Europe-Africa-India digital corridor was presented at the Global Gateway Forum, centred on the 11,700 km Blue Raman cable landing in Djibouti, India and Oman. 2025-11-24 - the union co-launched an EUR 7m skills programme.	ADVANCED
Gulf/UAE activities	Gulf MoUs, engagements and commitments	No Gulf-state digital investment or cooperation instrument, figure or programme is held. The position is unchanged at both ends of the window: ties strengthened with one Gulf state in November 2024 are mentioned in passing in a single source, and no instrument, figure or programme is held. It is a cited absence rather than an unexamined one. In a country whose whole external digital finance runs through three development lenders and one Chinese grant, and whose largest announced project is a memorandum with a Chinese promoter, the absence of Gulf engagement is a fact about the country's partners rather than about the base.	NO CHANGE

TOPIC	INDICATOR	DEVELOPMENTS	PROGRESS
India activities	India MoUs, engagements and commitments	Indian companies were invited to the national artificial-intelligence forum of September 2026. Nothing was held on this at the period's opening. The standing relationship is a platform one: a memorandum with an India-based foundation to deploy an open-source service platform with capacity transfer, signed in December 2024. 2025-10-10 - the Europe-Africa-India digital corridor was presented, resting on a cable landing in Djibouti, India and Oman, with a memorandum linking the European, Indian and African research networks. 2026-07-28 - the government invited Indian artificial-intelligence companies to its national forum of 2 and 3 September 2026, where the national strategy is to be presented. No bilateral instrument with India is on file.	ADVANCED

Where the record is thin

SYSTEM OR INSTRUMENT	WHAT WOULD SETTLE IT	LAST PROBED
Satellite broadband market authorisation	A licensing decision or authorisation register from the telecommunications regulator, or a ministerial statement on satellite market entry.	not yet probed
Commission nationale de protection des donnees (CNDP)	The decree constituting the CNDP, its membership, its public register of processing, or any published opinion or authorisation.	2026-08-09
Instrument governing police body-camera footage	The arrete, protocol or CNDP authorisation governing body-camera recording, retention and access.	not yet probed
Startup Act implementing decrees	The implementing decrees under Loi n 179/AN/25, or the first arrete awarding the Startup label.	2026-08-09
Gulf-state digital investment or cooperation instrument	A Gulf-state investment, financing or memorandum covering Djiboutian digital infrastructure.	not yet probed
Access-to-information law	A freedom-of-information or access-to-information act, or a bill before the National Assembly.	2026-04-01
Mobile broadband affordability figure	A national price for a data-only mobile broadband basket, from the regulator, the operator or the telecommunications union price database.	2025-11-17
Consumer-protection rules for digital payments	A central-bank instruction or code provision on redress, disclosure, fee transparency or dispute resolution for electronic money and digital payments.	2025-09-18
Digital records in rural police stations	A deployment record, equipment list or connectivity figure for police stations outside the capital.	2024-06-30
Public research programme in digital or data science	A university research-centre mandate, a funded research programme or a published research output in digital or data science.	2026-01-30
Instrument governing artificial-intelligence systems in public use	An artificial-intelligence law, decree or procurement rule, or the adopted national strategy text.	2026-01-29
