

MONTHLY UPDATE

Rural digital data capture: monthly update, July 2026

Edition of 2026-08-20 · compiled from the Data Landscapers source base

11 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.

The place reports do not share one window; the period above is the range they span.

Egypt

The rural fibre programme reports [about 5 million lines across more than 1,250 of 1,450 phase-one villages](#) in 52 markazes across 20 governorates, with 75% of village service complexes connected. No completion date for the remaining 200 villages is stated anywhere held, and [a 2024 account of the same programme uses a 4,500-village denominator](#) the base does not reconcile with the 1,450 above.

Eswatini

Rural data collection got hardware rather than a system. The agriculture ministry [handed 40 tablets and 4 laptops, valued at E313,504, to agricultural extension officers on 10 August](#) under an IFAD and Green Climate Fund-backed project, for real-time crop, livestock and weather reporting by officers working with smallholder farmers across all four regions. No officer total, data platform, reporting standard or custodian for the collected field data is stated, so what the reports feed into is not on the record.

Guinea

The first rural digital service to reach farmers this month was a private one carried on a state bank's counters. An agritech firm and the state rural bank [launched a first cohort at Conakry on 6 August pairing field sensors, weather alerts and agronomic advice with the bank's network of over 1,000 service points](#). No cohort size, cost or coverage is stated, and the base still holds no state rural digital-services programme to set beside it.

Malawi

Applied deployments in the month were single facilities rather than national systems: a university commissioned an artificial-intelligence fertigation system at its Thyolo campus on 17 July, automating irrigation and fertiliser application from real-time crop data, with no cost or funding source stated.

Mali

The same week [recommended an updated universal-access strategy with a white-zone map](#), against a 2030 universal [connectivity target](#). No map, coverage baseline or funding line accompanies the recommendation.

Niger

On 10 July the digital agency's [Villages Intelligents programme](#) opened a digital centre at Tabelot in Agadez, with training for women and girls.

Nigeria

The communications minister told the President on 4 August that [deployment of about 3,700 towers begins around October](#), reaching more than 20 million people in communities with no telecoms service and with the capital stated as raised — no funding source, operator or contract is named. The baseline against which it is measured is [23% of rural communities connected to 57% urban](#).

[Talks on artificial intelligence for smallholder farmers are exploratory](#): no programme, funding, timeline or counterparty ministry is named.

Sierra Leone

The agriculture ministry is [finalising an upgraded interactive voice response platform, reported 98% complete, to give farmers direct access to ministry officials](#) under the national food-security agenda. Voice is the right channel for the users it names, and the account states no launch date, language coverage, call volume or cost — [98% complete](#) being the ministry's own description of a system nobody outside it has used.

Togo

The Council of Ministers [amended the spectrum-royalty decree to price satellite and machine-to-machine traffic](#) on 30 July, so specialised operators can establish and rural connectivity extend. The amending text and its rates were unpublished at 31 July, and the parent decree is held only as an image scan, so the baseline rates cannot be read either.

Zambia

Satellite kits [connected a rural health clinic and two primary schools in Moomba Chiefdom](#) to government services through the national portal. No national count of connected facilities is published, and the state's purchase of foreign satellite capacity for the last mile sits alongside its own private 4G build.

Zimbabwe

The ICT minister told the National Assembly on 17 July that the universal services fund currently covers satellite-kit subscriptions only for digital centres and schools, and only for one year ([National Assembly account](#)).

Schools are where the terminals have gone. The education minister told the Senate that 11,500 satellite terminals have been distributed to schools — 8,000 to those with no wireless network and 3,500 to those already connected — with more than 1,300 institutions still to reach and a target of internet connectivity, solar power and national-grid access at every school by December 2026, alongside a cabinet commitment of 3% of GDP to research and innovation. The counts and the target are the minister's own; no school total, verification of installed and working terminals, or recurrent connectivity cost is stated — and the same fund that bought them pays a subscription for one year only.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
