

MONTHLY UPDATE

Data Exchange: monthly update, July 2026

Edition of 2026-08-20 · compiled from the Data Landscapers source base

35 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.

The place reports do not share one window; the period above is the range they span.

Algeria

Interconnection acquired a deadline before it acquired its rules. A think tank's first digital brief records that the [president gave the sectors one month from 12 July to interconnect through the national data centre](#), and nothing has been reported against that date. The two referentiels the interoperability decree makes the obligations wait on are still untraced, so the instrument that would carry the interconnection remains unenforceable while the timetable for it has already run.

Angola

A logistics regulator communiqué of 27 July described a single window absorbing three separate agency platforms, framed explicitly as a formalisation and tax-base instrument.

Benin

The exchange [recorded more than 138 million requests in total](#), 32.7m in the preceding thirty days, across 73 members, 176 information systems and 512 services.

A second kind of data exchange entered the record in August, and it is regional rather than national. The BIC-UEMOA credit information bureau held its first Cotonou data forum on 23 July, [reported on 13 August](#), with the finance ministry framing data quality as the route to cutting credit-approval turnaround to 48 hours. The bureau spans all eight union states with 321 data providers, about 48 million contracts and more than 20 million active borrowers. The figures are the operator's own and union-wide; nothing Benin-specific — coverage, dispute rate or the data-protection basis for the file — is held.

Cameroon

On 29 July a joint communiqué [established a trilateral customs steering committee with Nigeria and Benin](#), committing to harmonised procedures, digital interoperability and coordinated risk management on two named corridors, with no timeline, budget or system specification published. At home the layer that would carry any of this

acquired an owner rather than a design: at the opening of the national internet governance forum on 18 August the posts and telecommunications ministry [tasked the state operator CAMTEL with carrying national data and infrastructure interoperability](#), resting the mandate on its backbone, transmission, access and hosting infrastructure. No instrument, timetable or budget accompanies it.

Chad

The central bank [acceded to the pan-African payment and settlement system, with member-state banks to connect by end-2026](#). No Chadian bank is named and the target is untested. The 2027 budget orientations separately [prohibit any ministry putting in place a computer system incompatible with the existing platforms](#), and require tax, customs, treasury, budget, accounting, cadastre, identity, state property and land registry to interconnect on a single identifier. The budget-framing text is not held, and no cost, phasing or implementing agency is named.

Congo

Regionally, an [interoperable QR-code standard launched at Douala on 29 July](#), letting any application scan any merchant code across the six member states; no country-specific adoption figure is held. The same roadmap names an [inter-administration data exchange platform among three digital public infrastructure foundations](#).

One exchange did go into use, in the narrow place where the state examines itself. The national transparency commission [opened the second round of its public-finance transparency-code evaluation entirely online, covering budget years 2023 to 2025](#), with focal-point training completed in Brazzaville on 15 July with UNDP support. No supplier, custodian or results publication date is stated, and the platform is not publicly accessible on the record held.

Cote d'Ivoire

The minister told an information-systems seminar on 21 and 22 July that the first services onto the interoperability platform [had been chosen largely by volunteering rather than against user priorities](#), against targets of 100 services online by end-2026 and 700 within three years. No count of services in production has been published. Fourteen migration bodies met on 30 July to [co-design a single collection and profiling tool for returning migrants](#) and a roadmap for transferring their data into one directorate; no legal basis, data-protection safeguard or timetable for pooling personal data across fourteen bodies is stated.

The country's largest working data exchange is agricultural, and its pilot met its users in August. Producers at Meagui [pressed the coffee and cocoa board on 11 August over rollout gaps in the national cocoa traceability system](#) — the conditions attached to the producer card, collection in remote zones, deceased and expired cardholders, and bank fees tied to the card. The regional delegate said pilot-phase issues are feeding refinements. No enrolment count, coverage figure, data-controller arrangement or fee schedule for the card is held. The board for the cashew sector began the same sequence a step earlier, [launching a producer and plantation census at Korhogo on 11 August](#) as the database that any producer card or traceability system would have to stand on; no timetable or budget for it is stated. Across the border, Mali's customs administration told a Bamako roundtable that its [interconnection with Ivorian customs has a transit-goods data pilot running](#); the account is Mali's, no Ivorian statement is held, and no completion date for the full interconnection is given.

Djibouti

The same 23 July account names an ID Mobile credential, an online services portal and real-time card verification for banks and social-protection bodies as in preparation, with staffing and archive space named as the constraints. No date is given for any of them.

DR Congo

On 29 July a national electronic certification authority was named, not established; the July order already prices qualified trust services at US\$30,000 foreign and US\$10,000 local.

Egypt

The 19 July cabinet meeting produced the window's substantive disclosure: 105 government bodies connected and 100 national databases linked through the government digital switch, with the digital treasury's operating model applied to a number of services and e-signature and e-seal live and integrated with digital identity ([cabinet readout](#)). No register of the connected bodies, lawful basis or audit arrangement accompanies the figures.

Equatorial Guinea

The national interoperability framework the World Bank named as absent in 2024 is still absent, and August put a cost on that. At the National Development Agency's directorship handover on 7 August, its outgoing Inspector General [named limited data-sharing by line ministries as the agency's main obstacle](#) to monitoring delivery against the National Sustainable Development Strategy. The agency is the body meant to see across government, and it is describing itself as unable to.

Ethiopia

At the 24 July launch of a three-year strategic plan, the same meeting disclosed that a prime-ministerial board has approved a national data exchange platform — the interoperability layer the same meeting identified as missing.

Gabon

The regional interoperable QR-code standard was launched at Douala on 29 July 2026 under the monetary union regulation of 8 April 2026, in force across all six member states and settled through the regional switch, with the Gabonese scheme as its pilot ([launch](#)). The switch's 2025 figures, presented the following day, were 20.3m transactions worth FCFA 863bn across 153 participants ([figures](#)). On 9 July the central bank acceded to the pan-African payment and settlement system, with member-state banks to be connected by the end of 2026 ([announcement](#)).

A different kind of exchange went live in August. The airport-security committee [moved its advance passenger information and passenger-name-record system into its operational phase on 14 August](#), naming Royal Air Maroc lead carrier for IATA-code implementation under the state's convention with SECURIPORT, with border risk-

screening the stated purpose. The convention terms, the retention rule for passenger data and any authorisation by the data-protection authority are not held — and the country's biometric-processing prohibition, with the defect already recorded in its derogation, sits alongside it unremarked.

Gambia

Cross-border exchange moved further than domestic exchange did. At Saly on [16-17 July 2026](#) [Gambian and Senegalese customs agreed a three-month roadmap](#): install GAINDE at three border posts, deploy SIGMAT for real-time transit tracking, exchange customs data by interface once GAINDE is live, replace transit agents with a Single Administrative Document and reactivate the EnCen platform.

Ghana

Interoperable mobile-money transfers ran to [33.5 million transactions worth GH¢6.2bn in June](#) — about 1.3% of total mobile-money value. The share, not the volume, is the measure of interoperability, and it is the figure that has stayed small since the service went live in 2018.

Guinea

On 24 July, ONECI [signed a memorandum with NG Tech Innovation for a national interoperability and identity-verification platform over the RNPP](#), under the Diamo Djigui programme, before the elections director-general and Conakry's mayors. No value, duration or scope was disclosed and the text is not public.

A second exchange was constituted in August, in the one domain where the state has a reason to move data between four ministries at once. The [national One Health platform's steering committee was activated on 14 August, with the health, higher education, environment and livestock ministries signing a protocol agreement](#) for shared data, joint epidemiological surveillance and coordinated response to zoonotic and environmental risk. No platform build, data-sharing rule, custodian or protection standard for the shared health and animal data is stated — which is the shape a [published commentary the same week](#) argues runs through the whole estate: sectoral platforms in health, policing and civil registry still siloed a decade after the 2016 cybersecurity and data-protection law and more than a year after the April 2025 decree creating the unique identifier, with no independent, operational data-protection authority and no sovereignty over hosting or system audits.

Guinea-Bissau

[The government approved a national interoperability regulation](#), announced on 8 August 2026 by the World Bank-backed Western Africa Regional Digital Integration Program, which supports the work and presents the framework as Guinea-Bissau's contribution to the regional programme. A draft decree on the interoperability of public and private digital systems had been approved by the Council of Ministers on 10 July 2025 and had not moved since; the announcement names no decree number, no gazettal and no entry-into-force date, and the paired data-governance and cybersecurity decrees approved alongside it in 2025 remain where they were.

Kenya

The health ministry issued tender addenda on 27 July 2026 that [make financial, tax, insurance, pension, payroll, laboratory and identity interfaces day-one mandatory](#) for a national public-health enterprise system, and require primary hosting inside an approved Kenyan government or health-sector environment.

The Treasury is building the other kind of exchange — one that looks at the money coming in. It is [rolling out a Development Partners Management Information System, expected to launch before the end of 2026](#), to consolidate data on development-partner commitments, disbursements and funded programmes for planning and oversight. No supplier, cost, or statement of whether the consolidated data will be published is reported.

The regional payments interlink took another participant: a commercial bank group [went live on the pan-African system on 11 August, adding its branch network to instant cross-border transfers in local currencies](#).

Libya

The government issued [Decision No. 348 of 2026 on 17 July](#), authorising the Ministry of Economy and Trade to implement the Unified Economic Number as a single national identifier for every registered economic, commercial and investment entity, to be run by linking databases and exchanging information across ministries, agencies and public institutions, under a National Council chaired by the minister. No timetable, budget, vendor or legal basis for the linkage is stated.

Malawi

On 5 August the revenue authority signed an arrangement with its South African counterpart for real-time customs data exchange, with no go-live date and no published purpose-limitation, retention or reciprocity terms ([signing account](#)).

Two days later the South African side notified the update from its end, [publishing the arrangement for automatic exchange of customs information together with a draft rule amendment](#). The rule is still in draft and the go-live date is still unstated.

Mali

The national public key infrastructure and electronic signature services were [recommended for effective deployment at the digital week on 1 August](#). Nothing names a first service, an operator or a date.

Customs is the one exchange with a build behind it. At a Bamako round table on 7 August convened by the Prime Minister's office and the chamber of commerce with private operators, the customs directorate [presented a project to interconnect customs information systems for goods in transit](#), aimed at cutting customs, transit and import-export processing times and building on a World Bank technical mission of 31 July. [Mali's implementation of the WTO Trade Facilitation Agreement was put at 83.6%](#) at the same consultation. No counterpart administration, timetable, cost or system name is stated.

Mauritania

The digital ministry [opened a two-day workshop on 27 July](#) on blockchain in public administration, stating that the sector is building a national data management system to guarantee data quality, security, accessibility and inter-administration integration. UNDP's representative argued that data is strategic infrastructure on a par with roads and energy and that governance transformation, not technology, is the precondition. [Reporting two days later](#) placed this against a national blockchain policy in consultation since November 2025, with land administration, trade, public procurement and natural-resource management named as target areas; no draft text, adoption date or budget has been published.

Mauritius

The companion [Finance Bill, before Parliament from 27 July](#), widens what the statistics office may share with the finance ministry and imposes new declaration duties on public bodies — the state's data plumbing rewritten alongside its tax code, with no matching amendment to the Data Protection Act.

Morocco

A national water digital twin was described publicly on 28 July, to rest on a sovereign national data platform hosted in Morocco and fuse sensor networks, satellite observation and data from the basin agencies, the planning commission and engineering consultancies. The project lead put a first pilot 18 to 24 months away and gave no cost, budget line or procurement route ([project account](#)).

A platform already carrying national data went under inspection instead. The health ministry [put its national health-data platform through a security and performance audit running from July to September, covering infrastructure, application, database and cybersecurity on a 170,000 dirham budget](#), with no cyberattack or breach cited as the trigger. No findings are published.

Mozambique

The roads fund runs an [open-data portal publishing road, bridge and infrastructure project data under a Creative Commons licence and the open contracting standard for infrastructure](#), validated as a publisher against that standard in 2026. It is the base's clearest instance of Mozambican government data published to an external standard rather than to a page.

Nigeria

The telecoms and electrification regulators signed a [data-sharing agreement](#) on 30 July overlaying electrification geodata with universal-service deployment data.

Nine agencies took bilateral cover under the amended identity Act inside a fortnight, among them [Solid Minerals](#), the [Presidency](#) and [Women Affairs and the Bank of Industry](#); no account states a lawful basis, consent mechanism or retention rule for the sharing that follows. The [Nigeria Data Exchange now moves personal data between ministries in production](#) behind the Government Service Portal, on the same silence. Against the single-source-of-truth

framing, named practitioners [describe the arrangement as federated linkage on a shared identifier](#), with banks still reconciling by hand. The [National Single Window](#), launched in March, is contested by licensed customs agents who say clearance paperwork has multiplied rather than consolidated.

A state built its own exchange for the most sensitive category of all. Lagos [set out a Smart Health Information Platform on 8 August, to connect patient records, laboratory results and biological data across facilities](#) and to underpin an artificial-intelligence-driven health system, citing the Ebola and COVID-19 outbreaks as the case for moving off siloed facility records. No legal basis, data-controller arrangement, consent model, retention rule or relationship to the national data-protection regime is stated for it — the same silence the federal exchanges above are described in.

Senegal

A government enterprise-architecture account of 3 August records [platforms still siloed sixteen months after the interoperability platform launched](#), with the architecture to be fed by a full inventory of national digital systems. Four narrower exchanges moved in the same weeks: a [workshop on 23 July to diagnose social-protection systems](#), the minister stating each structure runs its own system and cannot share data; a [climate-transparency data project launched on 22 July over 42 months](#); a [three-month customs roadmap with Gambia](#); and a [convention to interconnect the digital agency and the health-cover platform](#), whose personal-data commitment was not referred to the regulator.

Sierra Leone

The finance ministry is [piloting a data exchange layer on X-Road](#). No production date, list of connected agencies or governance rules is published.

The exchange that already carries the state's money was found to be carrying something else. The anti-corruption commission [puts over 300 billion leones lost to backend manipulation of the customs system, with processed declarations deliberately deleted and dormant bank-teller profiles used to validate transactions after the account holders had left their institutions](#), and reasonable grounds to suspect coordinated collusion. The finding and the figure are the commission's own; no revenue-authority response, prosecution or remediation is on record.

Somalia

The Auditor-General put a number on how far the state's own systems are from talking to each other. The 2025 annual audit finds [seven government revenue and financial-management systems not integrated with the state financial management information system](#), and records 66 legal-compliance breaches across 22 audited bodies covering 60.1% of the national budget, including US\$18.5m of contracts awarded without following committee procedures. It also finds that a [port and airport revenue-share operator's reporting of US\\$38.08m, of a combined US\\$42.24m, could not be verified](#). The audit report itself is not held, the seven systems are not named, and no remediation plan or timetable is reported against any of it.

South Africa

Two exchanges were arranged this month and neither states what happens to the data. The medicines regulator [opened a pilot inviting sponsors and investigators to report serious adverse events through an externally hosted module](#), routing South African clinical-trial safety data through infrastructure hosted by the WHO's Uppsala centre and adopting its reporting standard rather than a domestic one; no pilot duration, participant target, data-residency statement or transition date to mandatory reporting is published. The revenue service [signed an implementation arrangement with Malawi's revenue authority for a secure platform exchanging customs information in real time](#), aligned to the World Customs Organisation data model and operationalising a mutual assistance agreement negotiated in 2019. No go-live date is stated, and no purpose-limitation, retention or reciprocity terms are published.

A third exchange was put out for comment rather than arranged. The revenue service [published a consultation paper proposing a five-corner digital VAT model – electronic invoicing, an interoperability framework and electronic reporting – moving toward VAT auto-assessment, with a phased rollout from 2026/27 and feedback due 16 October](#). It is the one of the three that will reach every registered business, and it is the one still open to be argued with; no cost to business, exemption threshold or accreditation regime for service providers is stated.

Sudan

[The National Investment Authority said on 4 August 2026](#) that a fully electronic single window for investment would operate only once all investment-related entities are linked electronically, with no list, sequence or date given – a precondition stated while the Authority is itself still building its first website.

Two further systems were directed rather than delivered. The national economic management committee, chaired by the Prime Minister, [directed the finance ministry and the central bank to expedite completion of the bank's electronic application system with the digital transformation ministry, to strengthen oversight of financial transactions](#) – no description of the system, its scope or its data is given beyond the instruction to finish it. And the agricultural bank said a [digital agricultural platform developed with the agriculture and digital transformation ministries is expected to launch soon](#), alongside second-phase season financing opening by end-August and a grain-silo agreement with a Chinese company; no launch date, function or farmer register is stated.

Tanzania

The public procurement appeals authority [directed all domestic and international bidders to lodge challenges through its online module and announced plans to integrate it with the judiciary's system](#), reported 31 July, with hearings by video conference already taking cases from bidders in five other countries. No date is attached to the integration.

Togo

The tax authority closed the paper route into the land record. From 17 August 2026 [digital submission of land parcel plans is mandatory through its single land window, ending paper filing by surveyors registered with the professional order](#). No fallback channel, fee schedule, submission volume or data-protection basis for the cadastral record is stated — and the country's own national interoperability and data-exchange framework remains *Not held*, so this is a single authority's window rather than a piece of a shared layer.

Zambia

The government service bus, the central integration layer, onboarded eight of 116 local authorities from June 2026 and now carries more than 400 government services with over K8.8 billion collected cumulatively across the service bus, payment gateway, national portal and payment platform ([collection figures](#); [Accountant General's office](#)).

A register of a different kind opened alongside it. Zambia [launched a fully digital National Carbon Registry on 7 August](#), embedded in the national measurement, reporting and verification system and interoperable with Article 6 of the Paris Agreement, developed under a donor programme with a UN climate centre, a consulting group and a green growth institute. No public access, transaction count, custodian ministry or disclosure rule for its holdings is stated — which for a registry whose purpose is to make carbon claims checkable is the question it exists to answer.

Zimbabwe

A whole-of-government enterprise resource planning system, integrating finance, human resources, supply chain and asset management across the public sector, was launched on 29 July 2026 and presented by the ministry as the clean data layer any government artificial intelligence would need; no ministry count, deployment schedule or cost was stated ([launch account](#)). The ministry also committed to mandated open interface standards for public-sector platforms, publishing neither a standard nor a compliance deadline ([launch account](#)).

The online border management system Zimbabwe has been rolling out in phases since January 2025 was examined during a Rwandan immigration delegation's visit to two border posts on 29 July; no port coverage, completion date or throughput figure is published ([visit account](#)).

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
