MONTHLY UPDATE

# Energy: monthly update, July 2026

Edition of 2026-08-20 · compiled from the Data Landscapers source base

---

*13 places. Every block below is carried verbatim from that place's own monthly update, where it was written, sourced and checked; nothing is written here.*

*The place reports do not share one window; the period above is the range they span.*

## Botswana

The facility's power is the unusual part. [On-site gas-fired generation is supplemented by solar introduced to cover periods of lower gas availability, with battery and compressed-gas storage under review](#) — solar specified as firming for gas, the reverse of the usual diesel-backup arrangement. [An initial 5 MW solar development was assessed during the quarter and an extension of the gas gathering network to connect a further production well is stated subject to funding](#); neither carries a capital cost, approval or date, and the company states both are work-programme items rather than guidance. The second gates the data centre: capacity growth turns on upstream gas work rather than on demand.

## Burundi

Among the regulator's remedies for degraded service, named [on 3 August](#), is a planned study on powering mobile base stations.

## Djibouti

The same 19 July memorandum with LinkWise commits [up to 500 MW of solar, wind and storage generation](#) to power the AI compute zone — a figure the promoters supply.

## Ethiopia

The incumbent's renewable programme reached [39.72 MW of installed solar across 190 fully solar-powered sites, 867 hybrid systems and 1,114 lithium-ion storage units](#), 12.72 MW of it added over the financial year, with diesel generator running time down by up to 40%. The figures are the operator's own and unaudited.

## Gabon

About 22 per cent of the Nkok facility's site energy comes from a photovoltaic plant, with water-free cooling ([figures given at the inauguration](#)).

## Ghana

No power purchase, tariff or on-site generation arrangement is published for any named Ghanaian data-centre facility, and a probe on 5 August found none. What is available is country-level and modelled: [about 6 GW of installed capacity of which roughly half reaches the end user, electricity at about US\\$0.12 per kWh and independent producers at more than 60% of capacity](#), on 2024 estimates in an analyst brief.

## Kenya

Power is what is holding the data-centre build back, and there is no rule governing it. A hyperscale project [stalled on power capacity in July, against about 3 GW of installed supply and a 10 GW-by-2030 target — a single 1 GW facility would take a third of supply](#). No published tariff, gazetted large-load connection rule or grid-connection framework for data centres exists: every power arrangement the base holds is bilateral.

## Malawi

The minister cited an 8% rise in electricity tariffs and a roughly 144% rise in fuel prices in the operators' cost case ([parliamentary account](#)).

## Mauritius

Cabinet also [approved for signature a memorandum with Saudi Arabia](#) putting digital transformation and energy-sector cybersecurity alongside hydrocarbons — an approval to sign, not a signature, with no date, term, value or committed system stated.

## Mozambique

The same data centre draws on grid, photovoltaic and generator supply ([inauguration account](#)).

## Sierra Leone

The constraint under everything else eased slightly. A World Bank-funded [40MW solar-plus-storage project at Lungi and Newton became fully operational, commissioned in July 2026 and projected to raise the electricity access rate toward 36%](#) and to ease the outages that interrupt telecommunications and digital services. The access projection is the project's own; no generation outturn, grid-availability series or measured effect on network uptime is held, so the connection between the plant and the services it is said to protect is asserted rather than shown.

## Uganda

The largest operator's 2025 sustainability report puts [45% of network sites on solar or hydro, with a 490 kWh solar plant commissioned at headquarters](#). The [figures are the company's own and unaudited](#), and no prior-year share is held against which to read that share.

## Zimbabwe

The listed infrastructure company commenced phase 1 of a 100 MW solar farm for its technology park, and its fuel-management system was credited with reducing energy consumption on tower sites, with no percentage, litre, cost or uptime figure given ([trading update](#)).

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
