

MONTHLY UPDATE

Ghana: monthly update, August – September 2026

Edition of 2026-09-08 • 114 systems and instruments tracked

Developments summarised from sources published between the beginning of last month and today.

SUMMARY OF THE MONTH • GOVERNANCE • FINANCE • ICT INFRASTRUCTURE • DPI • DIGITALISATION • TECHNOLOGY
• CAPACITY • INCLUSION • DATA

Summary of the month

Two government portals broke in the same fortnight. Tax payment processing on the services portal [failed from 14 August and was still unresolved a week later](#), and the [online passport application portal went down, the outage confirmed by the foreign ministry](#). Against that, government [directed that public-service salaries be suspended from 15 September for staff whose identity-card details do not match](#) – a state making its own systems a condition of pay while two of its public-facing systems are down.

The month closed on the ministry's own account of itself, and the honest half of it is the arithmetic: the coders programme holds [141,954 registrations against 5,812 completions](#), the rural telephony project [1,400 live sites of 2,016](#), and the network [8,578 fibre cuts projected for 2026 against a dig-once policy still awaiting Cabinet](#). Parliament passed the instrument for [biometric SIM registration](#), which has not begun.

Enforcement is the month's other thread, and it is unusually visible. The information-rights commission [fined 254 public bodies over reporting delays](#); the cybersecurity authority's first published fines against a public body and its supplier [were called premature and referred to the Attorney-General](#); and the data protection commission [took delivery of field-enforcement vehicles](#). On virtual assets a [coordinating committee was inaugurated](#), and a bank opened direct renminbi settlement. The minister also [announced a cut in fibre broadband prices, effective the same day](#).

Governance

Strategies, plans and policies

The government [announced a ten-year artificial-intelligence implementation plan on 29 July](#) with measurable annual milestones, built with United Nations partners.

The wider reform the digital pillar sits in reached validation on 12 August: a [five-year, seven-pillar public sector reform strategy was validated at a stakeholder workshop ahead of formal adoption](#), one pillar being digitalised [public-sector systems](#). No text, budget or adoption date is published.

Legislation and regulation

The ministry took industry comment on 27 July on the [draft digital economy and innovation development fund bill](#); the levy rate and governance structure are unestablished, and the draft is not published. Speaking at an artificial-intelligence summit on 29 July, the ministry named a data harmonisation Act and a proposed data exchange Act as the enabling layer under a ten-year implementation plan — the first mention on file of an exchange statute distinct from harmonisation, and neither has a published draft.

The month closed on a ministerial account of the legislative programme itself: under a World Bank-backed acceleration project, [a review of fifteen pieces of ICT legislation is about half complete, with stakeholder consultation already finished on part of it](#).

Data protection

The data-protection regulator's own enforcement record did not change; the action framed as a data-privacy violation in the month was taken by the central bank. But the cyber security authority produced the first enforcement of its kind the base holds, and its subject is another arm of the state. It [fined the Registrar of Companies GH¢240,000 for engaging an unlicensed cybersecurity provider and fined that provider GH¢120,000 for operating without a licence](#), after the registrar ignored a June 2026 directive to engage a licensed tier-one critical-information-infrastructure provider under the Cybersecurity Act 2020. The registrar has since contested it, [saying the procurement of its network and security operations centre was substantially complete before the tier-one directive was issued](#); no adjudication of that timeline is held.

The regulator's own first-half numbers reached the base on 7 September, and they measure activity rather than enforcement: [a 51.5% rise in regulatory activity and a 98.4% rise in newly registered data controllers over the first half of 2026, with a public campaign put at an estimated 25 million people reached](#). The controller figure is a growth rate published without the base it grew from, and no fine or prosecution has yet been.

Regional collaboration

Ghana's regional position moved on three fronts, none of them with a text attached. African Union ministers [endorsed continental roll-out of the illicit-financial-flows policy tracker](#) from the six-country pilot Ghana ran over eighteen months, the finance ministry reporting that it contributed to recovering millions of dollars in revenue — with no Ghana-specific score, finding or reform list published. The communications ministry [announced a partnership on digital-policy intelligence and regulatory-analysis tools](#) at an Accra workshop on 10 August, covering the national AI strategy, data-governance work and the coders programme, with no funding, duration or deliverables stated. And the [fintech licence passporting memorandum with Rwanda remains unpublished by either central bank](#) eighteen months after signature, so which licence categories are recognised, and on what conditions, is still unestablished.

A fourth front does have something running. A continental alliance and a German development agency say [a digital identity issued in Rwanda, Ghana or Benin is now recognised in the other two, with eighteen further countries said to be joining](#). No scale, service, date or governing instrument is stated.

Public debate and participation in policymaking

The statistical service put a number on what digitisation is being asked to fix. Its governance series records citizens reporting demands for unofficial payments [rising from 51% in the first half of 2025 to 69% in the second](#), and the service names digitalisation, fee transparency and public education as its response, citing a marked fall in bribery at

the passport office after digitisation and saying the Office of the Chief of Staff has directed the ten institutions the series flagged as high-risk to report back on remediation. The passport-office comparison is asserted without a before-and-after figure, and the series measures reported demands rather than cases proven.

The same week the ministry took the governance argument outward and inward at once: it [convened an Accra workshop with a policy-monitoring organisation and a trade endowment on digital governance, regulatory coordination and international digital-trade engagement](#), framed against the national artificial-intelligence strategy, the coders programme and the continental digital trade protocol; and its deputy minister [urged information-management professionals to secure and better manage government data as artificial-intelligence use grows](#). Neither produces an instrument, and the national data strategy has been in development since 2024.

Finance

MoUs and other agreements

The country renewed the agreement under which several of its digital customs systems are financed. The [TradeMark Africa country programme memorandum was renewed on 14 August](#), continuing trade-facilitation and continental-free-trade-readiness work, including digital customs systems at the Akanu-Noepe joint border post and support for more than 1,250 women and small-scale cross-border traders. No financing sum, term or workplan is stated — and the same border post is where a regional dialogue on identity-card and transit-system interoperability was held four days earlier.

New investments

Two new commitments enter the base this month, one domestic and one from a development partner. The government [put GH¢100 million, about US\\$8.88 million, behind the Ghana National Research Fund for 2026](#), separately from its US\$250 million commitment to a national artificial-intelligence computing centre; no disbursement or call for proposals is reported against the allocation. The UN capital development fund [began a second phase with a Ghanaian microcredit company on a US\\$200,000 grant it expects to catalyse US\\$1 million in loans and savings](#), after a first phase on US\$30,000 that reached 470 enterprises across three regions and recorded 1,988 youth loans totalling GHS494,760.

A third, much smaller commitment closed the month: a Ghanaian remittance startup moving money from the United States to Ghana [raised US\\$333,000 from a blockchain foundation's community fund, to launch an international payment card usable online and in stores](#). The commitment date is not stated in the source and no valuation, corridor volume or user count is published.

ICT Infrastructure

Connectivity

The regulator's [consolidated response of 31 July](#) answered sixty written queries from four prospective applicants, formally amended the request for applications in seven places, and shifted every subsequent date by 21 days, with licence fees now due 17 November. [It refused any extension to the 70% population coverage obligation of 6 March 2027 while confirming that obligation is band- and technology-neutral and can be met in substantial part from existing deployment](#). It also rewrote the dominant operator's rural schedule from licence-relative years into fixed dates of December 2029, 2032 and 2035, expressly so that buying spectrum would not accelerate an equivalent existing commitment. [And it recharacterised the 40% premium on that operator's reserve prices in writing as a price for attributable value rather than a sanction or a market-power remedy, declining to publish its valuation model during a live assignment](#).

Beneath the licensing argument, the traffic that never leaves the country was counted. On 16 August the Accra exchange was reported [past 200 Gbps, against three exchanges that barely overlap: only 4 of 39 connected networks peer at all three, so most local traffic still transits abroad](#). The headline figure is the smaller finding. An exchange is worth the traffic it keeps local, and three partly-overlapping exchanges keep less of it than one would.

The build was then put in proportion. On 6 September the minister put the national requirement at [about 6,000 additional cell sites against roughly 1,100 in the current round, which is to complete in 2027](#) — stated without the coverage or quality standard it is measured against. What is actually being built is [800 sites committed by the dominant operator with 180 already active and carrying traffic, and a 2026 plan of 2,698 sites at the second operator of which 1,890 are live within a network of roughly 9,000](#), and the regulator spent the week [taking radio-frequency exposure messaging to market traders and transport operators in Koforidua](#) after opposition to a mast at a lorry station — the cost of the build showing up as consent rather than capital.

The backbone under it is losing ground faster than the record showed. Industry now projects [8,578 fibre cuts nationwide in 2026, 4,289 of them already in the first half, at roughly US\\$2,045 a repair against more than US\\$20m spent on repairs in 2025](#), with major corridors averaging 72 cuts a month and uncoordinated excavation under the government's own road programme accounting for about half of road-related cuts. The dig-once policy that answers it has slipped again: a [joint Cabinet memorandum with the roads ministry now awaits Cabinet](#), its third-quarter 2026 implementation target passed with no instrument on record. Against that, [voice over LTE has risen from about 7% of traffic to 22.43% on 8.4 million subscribers](#).

The state's own operator got its board back. On 3 September a seven-member board was sworn in for the company behind the AT Ghana brand, [releasing policy directives that had gone unimplemented for almost two months for want of one: spectrum in three bands from the regulator, and core-network access from the universal-access fund, both held back pending audited accounts](#). Neither the bands nor the terms of the access are published.

Energy

The transmission system failed nationally twice in three weeks. A major fault on the Akosombo-Volta line at about 4.30am on 20 August [tripped the Akosombo units and some thermal plants](#), three weeks after [a system disturbance at about 3.11am on 29 July had tripped generating plants simultaneously](#). The operator opened a technical investigation into the first and said further measures were needed to strengthen reliability after the second; no interruption index is published for either.

On 28 August the energy ministry [launched a GHS598 million project to connect 206 communities across all 18 districts of the Volta Region within six months](#), part of a programme covering four regions this year and four more annually to 2030. It is the largest funded rural-electrification commitment the base holds, and it lands in the same month as the second national outage.

Technical Capacity

The cable inventory did not move; what moved is the base's reading of it. The regulator [names five submarine cable providers on an undated page](#) resting the licence on section 3(8) of the Electronic Communications Act 2008, a list that predates later landings, while an analyst brief [counts six cables at Accra and about 2.5 Tbps of international capacity in use](#) on a 2024 estimate. Neither is the regulator's own current count.

Cybersecurity

A community-media cyber capability project launched on 3 August, certifying community-radio journalists into a standing press corps.

The Cybersecurity Act's licensing regime produced its first published penalties. The Cyber Security Authority [fined the Office of the Registrar of Companies and Purpleline Solutions a combined GH¢360,000 for breaching the Act's licensing requirements on 13 August](#) — GH¢240,000 against the Registrar in two penalties of GH¢120,000 for [engaging an unlicensed cybersecurity service provider](#), and GH¢120,000 against the provider for [operating without a licence](#). One of the two penalised bodies is itself a state registry. Five days later the Authority [fined a Big Four firm's Ghana practice GH¢360,000 — three penalties of GH¢120,000 — for continuing to provide regulated cybersecurity services, including to owners of critical information infrastructure, after three directives to obtain a licence](#), ordering it to cease and desist, governance, risk and compliance work included. The base holds no published penalty under the Act before 13 August, so both actions fall inside six days, and the Authority states it will name unlicensed providers publicly as an enforcement measure. Neither of the two largest penalties survived the week as announced. The firm's fine was declared [satisfactorily resolved in a joint statement issued the same day](#), which does not state whether it was paid, reduced or withdrawn; and the Registrar [rejected its own sanction as premature and procedurally unfair, dating a finance-ministry commitment authorisation to 28 November 2025 and its tender to 4 December, before the directive it is said to have breached](#). A regime whose first week of enforcement produces one settlement without terms and one contested timeline has published a gross figure, not a collected one.

The regulator also [held a two-day consultative and validation workshop with UNICEF Ghana on online child sexual exploitation and abuse](#), reviewing the national response and naming coordination and frontline-capacity gaps; no instrument or programme follows from it on the record.

It started teaching. A session at Accra on 19 August [put newsroom devices to journalists as deliberate targets rather than accidental victims, citing an Angolan journalist's 2024 spyware infection as the regional precedent](#). No count of journalists trained under the project has been published.

The response team behind the licensing regime published a volume figure for the first time: it [handled 3,363 incidents between January and June 2026 and ran vulnerability assessments across 25 critical information infrastructure institutions](#). There is no breakdown by type, sector or outcome, so it establishes how much came in and nothing about what happened to it.

DPI

Data Exchange

Interoperable mobile-money transfers ran to [33.5 million transactions worth GH¢6.2bn in June](#) — about 1.3% of total mobile-money value. The share, not the volume, is the measure of interoperability, and it is the figure that has stayed small since the service went live in 2018.

Digital Identity and CRVS

The identity regulator publicised amendment regulations on 16 July that had come into force on 9 June, and the interior minister then set the enforcement date: banks, telecoms operators, hospitals, schools, insurers and agencies have [a three-month transition from 27 July to 2 November 2026](#) to install readers and integrate with the verification service, on a sanctions ladder running to suspension of access and licence withdrawal. Verification tied to SIM registration is explicitly excluded, with no timetable announced.

The first paid round-the-clock identity centre opened on 1 August with all services attracting approved charges and no fee schedule published; by 13 August the agency described the Labone centre as [running registration on three shifts around the clock](#), presented as part of the government's wider 24-hour economy programme. No throughput or staffing figure is published, and the base holds no equivalent extension of the free daytime service.

The central bank republished its standing directive on 2 September: under regulation 7 of the 2012 national identity register regulations, [the card has been the only identification accepted for transactions at every institution the bank licenses and regulates since 1 July 2022](#). The base had carried that requirement only from a January 2026 guidance note. Dated four years earlier, it makes the photocopy ban an enforcement step against a rule already long in force rather than a new obligation.

The SIM half of the identity regime moved for the first time in nine months. The minister said on 7 September that [Parliament has passed the legislative instrument governing SIM registration and the biometric verification phase will be introduced before the end of 2026](#), the same account putting completion of the 2021-2023 exercise it replaces at 44.28% of subscribers. What has moved is the authority to act: no start date, enrolment route or subscriber deadline is published and the instrument itself is not held.

Digital Payments and Fintech

Central bank data for June 2026 put mobile money at [954 million transactions worth GH¢492.9bn](#), against GH¢323.2bn a year earlier, on 84.6 million registered wallets of which 26.4 million were active; [interoperable transfers were GH¢6.2bn, about 1.3% of value](#).

Enforcement of the digital-credit regime opened. A notice of 20 July recorded the 30 June licensing deadline as elapsed, and a notice of [3 August named twenty unlicensed lending applications](#), cautioning banks and payment providers against processing for them and framing the harm first as a violation of customer data privacy. The promised register of licensed providers remains unpublished.

The dominant operator opened a channel to the next cohort of providers instead. A [three-month fintech accelerator launched on 12 August across Accra, Kumasi and Tamale](#), with a domestic technology firm as its official technology partner. No cohort size, selection criteria, funding or equity terms are stated.

Card acceptance widened from outside the domestic rails. A commercial bank and an international card scheme [opened online acceptance of that scheme's cards to participating merchants in nine African markets including Ghana on 19 August](#), settling in local currency, US dollars or both; the merchant count is given for the nine markets together and not for Ghana.

The virtual-asset regime acquired its coordinating machinery. A five-agency committee is [constituted and chaired by the central bank governor, joining the securities regulator, the finance ministry, the cyber security authority and the financial intelligence centre, working towards having the Virtual Asset Service Providers Act fully in force by 2027](#), and on 4 September the securities regulator [admitted a second sandbox cohort of ten participants, run with the central bank to test and refine the framework the Act introduced](#), one of them a stablecoin infrastructure provider testing stablecoin payment, fiat settlement and wallet infrastructure under supervision. The cohort list, the first cohort's outcomes and the sandbox's exit criteria are not published.

Registries

Two registries entered the base this month as standing descriptions rather than events. The revenue authority's own page sets out [the taxpayer identification number system it maintains under the 2016 revenue administration Act](#), and the national digital address system's [official page records it live](#). Neither carries an internal date, so both are dated to capture and neither reports a change: what moved is the base's own coverage, not the registries.

Nothing published with either gives a register size, a coverage rate or a public-sector consumer, which is the figure each would need before it could be said to be working.

A third registry arrived as a private product reading public records. [Marryfy launched in Accra on 28 August](#), letting users search and verify registered marriage and divorce records drawn from the registrar-general's department, the courts, district assemblies and the Gazette, presented by the gender ministry as answering the need for reliable information before people marry. No data-sharing agreement, fee schedule, coverage figure or record count is published, so what is established is that the records are searchable, not that they are complete.

Sectoral management information systems

One sectoral system was assessed rather than built. A Danish-funded gap assessment of the meteorological agency [reported gaps across its ICT infrastructure, digital systems, data governance and cybersecurity framework](#), presented to the communications ministry in Accra under a bilateral weather and climate cooperation. Neither the assessment text nor any cost, timetable or funding line for the roadmap it recommends is published, so what the month holds is a diagnosis and no commitment to act on it.

Other GovTech and e-Gov

The finance ministry reported to Parliament that the customs valuation system had [analysed about 366,000 declarations to 17 July](#), 24% triggering more than one risk indicator, with collections up 17.5% against a 6.3% rise in declared value. A second public sector reform strategy was validated on 30 July on seven pillars, 27 programmes and 135 activities.

The revenue side gained a plan on 12 August. A [Korean-backed Tax Modernisation Master Plan covering income tax, value-added tax, tax administration and electronic tax administration was set out](#), with artificial intelligence already in service on customs valuation. No cost, timetable or implementation schedule accompanies it, which puts it a stage behind the customs system it is presented alongside.

Two systems moved in opposite directions in the same week. The online passport application service [went down on 25 August](#), the foreign ministry confirming a technical fault the same day and naming no cause and no restoration date. The accountant-general's department, meanwhile, [will suspend from 15 September the salaries of government employees whose national identity details are missing from or do not match the payroll system](#), ahead of a nationwide re-verification exercise, the directive prompted by discrepancies surfaced when the upgraded payslip system left some employees unable to open their payslips.

Digitalisation

Digitalisation of sub-national government

Local government has gone in one month from a reform strategy's integration target to a signed programme covering every assembly in the country. The Office of the Head of the Local Government Service [signed a memorandum on 3 September with a Ghanaian networks company to turn all 261 metropolitan, municipal and district assemblies into what both parties call smart assemblies](#), spanning waste management, public safety, education, healthcare, environmental monitoring and citizen engagement. No contract value, financing structure or timeline is stated, which is the whole of what would make it testable. Separately a governance organisation [launched a citizen-reporting platform in South Tongu District that routes service-delivery complaints to the assembly and keeps the reporting citizen informed until resolution](#) - a civil-society instrument in one district, not an assembly system.

Rural digital data capture

The police service's own page on its criminal data bureau entered the base this month, and what it establishes is where the paper stops: [the bureau at investigations headquarters receives fingerprints and crime details on forms sent in from police stations](#), including rural and district ones. The digitisation is at the centre and the stations feed it on paper.

It is a standing description dated to capture rather than an event, and it sits against the interior ministry's own sector plan, which names limited logistics particularly in rural and border communities as the constraint on digitisation reaching those stations.

Technology

AI

UNESCO's Accra head replied from the same platform that strategies without funding and execution remain shell documents.

Applications opened on 1 July for an applied artificial-intelligence lab in Accra, closing 31 August with no cohort size or Ghana-specific spend disclosed.

The external assessment of readiness arrived on 7 September. Ghana is [one of 77 countries to have run UNESCO's readiness assessment methodology, under an EU-funded project on implementing the ethics recommendation](#), and the draft findings presented at consultation stated that the country lacks binding AI-specific regulation and comprehensive data governance frameworks. The report also puts a third dating on the national strategy — 2023-2033, approved 24 April 2026 — against the held text titled 2025-2035 and dated December 2025 and a [ministerial statement placing Cabinet approval in the week before 26 February 2026](#). None of the three is reconciled.

ICT Industry

On 27 July a company filed a writ claiming authorship of the 2007 design of the dominant mobile-money platform; the operator answered on 31 July that the claims are without merit and it will contest fully.

Innovation ecosystem

Two assistive devices are [in pilot with a disability association — smart glasses and an ultrasonic obstacle detector — at a target price of about GH¢2,000 and a 1,500-user target within a year](#).

A freight platform founded in 2023 was profiled on 19 August: it [takes booking, cost estimation, secured payment and cargo tracking, and handles customs formalities and border documentation for importers, exporters and online merchants](#). No volume, revenue or customer figure is stated, and the account is a profile rather than a filing.

Capacity

Literacy

The education council completed a revised basic-education curriculum adding coding, artificial intelligence and technical subjects, announced on 20 July and not yet adopted.

Training and skills

Training capacity was the month's activity. A youth agency [signed for 2,000 vendor-certified microdegree places on 14 July](#) — Ghana taking 2,000 of the 3,000 allocated to the whole continent — fully government-funded, with 600 paid internships and a five-region pilot, and no programme cost disclosed. [A university became the first tertiary institution to embed the national coders programme permanently in its curriculum on 29 July, receiving a further 2,000 laptops the next day.](#) Three universities — Kumasi Technical University, the Kwame Nkrumah University of Science and Technology and the University of Mines and Technology — [completed the first pilot of the European-funded UNIHUBS blended-learning course in entrepreneurship, innovation and digital skills, run from late June to July and reported on 3 September,](#) covering business development, technology transfer in higher education, digital marketing and professional communication. The consortium treated it as a quality-assurance run before pilots in Kenya and Tanzania this month; no participant count, budget or grant number is published, and the account is the project's own.

The coders programme published its funnel rather than a headline for the first time: [141,954 registered accounts, 27,782 admitted learners and 5,812 logged course completions as at 2 August 2026, cybersecurity the largest track at 8,570,](#) with 30,444 admitted through one commercial platform, 10,143 through a second and 24,394 learners self-paced. Registration is not admission and admission is not completion, and it is the ratio between them rather than any one number that measures the programme against its target of a million.

Research institutions

The month's research capacity news is a funding gap stated by the minister who has to close it. Education Minister Haruna Iddrisu [said the US\\$30 million Chinese government grant for a University of Science and Technology at Damongo will not be enough to complete and equip it, putting the full cost at more than US\\$100 million;](#) the university is intended as a centre for robotics, digital sciences and artificial intelligence in a region that currently has none. [The grant itself was disclosed at a working visit by the incoming Chinese ambassador,](#) and neither account dates it beyond the previous year.

Inclusion

Access to services

The mid-year fiscal review of 23 July recorded GH¢485m paid to cash-grant beneficiaries in the first half of 2026 and named no allocation at all to the communications ministry, the access fund, the coders programme or the artificial-intelligence strategy.

Digital divides

At a policy dialogue on 29 July the regulator said an existing hotspot authorisation [could found a dedicated community-network regime,](#) with no timetable, consultation or draft announced; a civil-society policy lead placed four other African states ahead of Ghana on enabling frameworks.

The [draft digital economy and innovation development fund bill](#) would also convert the universal-access fund into a wider innovation and skills fund, with the fate of the rural-access earmark unestablished.

Existing money went the other way. An implementing partner's account of 12 August reports that [connectivity and digital-inclusion work in Ghana slowed or stopped after the American aid wind-down of 2025, in which 83% of the agency's programmes were cut,](#) the multi-funder Women in the Digital Economy Fund losing its American component while the parts other funders backed continued. No replacement funder is named and no Ghanaian figure is given.

The rural project's own numbers reached the base on 5 September. [1,400 of 2,016 rural telephony sites are live and the universal-access fund carries a GHS 30m allocation for the project in 2026](#), with the minister directing that every site be upgraded to at least 4G on the ground that 2G and 3G no longer carry the services the sites exist to deliver, a directive [repeated on an Eastern Region site inspection the next day](#). It carries no timetable, cost or contracting route, and 616 sites are not yet live. Above it, [smartphone penetration is put at 71.8% in June 2026 against 27.5% a decade earlier](#) — the minister's figure, on a different base from the household survey the record already holds.

Data

National statistics

The statistical service [published the third wave of its six-monthly governance panel on 6 August](#), run across all sixteen regions, with the Government Statistician putting its findings to digital remedies — digitising public services and publishing official fees among them. The report text is not held. Separately the finance minister [asked the service to develop a methodology for quarterly employment statistics](#); none is published and no timetable is set.

Open data

The one open-data movement in the window is a system that exists and a commitment that cannot pay for it. The fisheries ministry and the national multi-stakeholder group built an online Fisheries Information System, launched at an ocean conference in June 2026, but [inadequate funding is constraining the 2024 Fisheries Transparency Initiative commitment it sits under](#), with the minister pointing to part of a goods-and-services allocation and to unconcluded talks with Norway on reviving a development funding mechanism. A published system with no secured budget behind the disclosure regime is the familiar shape here, and the national open-data instrument remains **Not held**.

Use of satellite data

Two satellite-derived systems were [named as live deployments at a university lecture reported on 10 August](#): an agricultural information and monitoring system, and a national forest monitoring system paired with a deforestation tracker built toward European deforestation-regulation compliance for cocoa and gold supply chains. Both are named by their builder, and no coverage, accuracy, user or funding figure is published for either.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
