

MONTHLY UPDATE

Guinea: monthly update, August – September 2026

Edition of 2026-09-08 · 33 systems and instruments tracked

Developments summarised from sources published between the beginning of last month and today.

SUMMARY OF THE MONTH · GOVERNANCE · ICT INFRASTRUCTURE · DPI · DIGITALISATION · TECHNOLOGY · DATA

Summary of the month

The state acquired instruments and lost a minister. The President [signed the implementing decree for electronic signatures on 19 August](#) and [fixed by decree on 21 August](#) how public procurement moves online, and three government platforms opened in the same weeks: [a state mission-order system](#), [a decrees and orders management tool taken under presidential oversight](#) and [a civil-service housing registration platform](#). The communication and digital economy minister [was dismissed by decree made public on 21 August](#), the portfolio now held on an interim basis.

Against that, access narrowed and the paper ran out. [Facebook, YouTube and TikTok have been blocked since 28 July and were still blocked on 7 August](#), with no official explanation held, and [a two-hour national outage on 7 August](#) was traced to the state landing-station operator. Communes [report a nationwide stockout of the secured paper birth certificates are printed on, running about a month with no restocking date](#), against a [birth-registration rate the territorial administration minister puts at 72%](#).

Governance

Strategies, plans and policies

The legislature acquired a standing counterpart to all of this: the National Assembly's ICT committee [held its first working session on 7 August](#) and [named mobile money, social-media regulation and network security as its priorities](#), to be worked in coordination with the telecommunications ministry; no work programme or timetable is published. A [presidential decree of 27 July 2026 reshuffled the transition government](#), keeping Mourana Soumah at the Ministère de la Communication, de l'Économie numérique et de l'Innovation, which he has held since the February 2026 merger. Djenabou Touré takes Administration du Territoire et de la Décentralisation, the ministry supervising ONECI and the biometric civil-registration programme; a Djenabou Touré was director-general of elections and attended the ONECI signing three days earlier, and the source does not confirm they are the same person. A World Bank tender published the same week still names the predecessor department, MPTEN, as supervising WARDIP.

Legislation and regulation

Two instruments were made and a third process opened. The President [signed the implementing decree for electronic signatures on 19 August](#), and the government [opened a workshop on three bills consolidating the legal framework of the public administration](#). Neither the decree text nor the bills are published, so their scope cannot be read off the record.

Data protection

Enforcement arrived before the institutions did. A first-instance court [convicted a defendant under the cybersecurity and data-protection law on 19 August, imposing six months' imprisonment of which five were suspended, a 40 million GNF fine and deletion of the defendant's social-media account](#) – the first conviction under that law on file, and an account deletion ordered by a court rather than by a platform. Separately the central bank [warned against unauthorised crypto-asset and online trading platforms](#), naming no platform and stating no licensing route.

Regional collaboration

Guinea took the presidency of the regional audiovisual regulators' platform on 31 August, when the [12th General Assembly of the platform of the eight monetary-union states and Guinea opened in Conakry and its leadership passed to the head of the national communications authority](#). The two-day agenda was harmonising the legal and technical tools for regulating social platforms against cybersecurity and social-cohesion risks, AI-generated disinformation and deepfakes among them, and strengthening the standing of regulators over those platforms. Opening it, the Justice Minister argued for a framework that ["protects without stifling, regulates without censoring"](#) and called cybersecurity a question of sovereignty rather than a technical one. What the record holds is a presidency and an agenda: no harmonised instrument, timetable or funding is announced.

Standards

The committee meant to make the state's own financial data consistent [sat again on 6 August, three years after it was created to align the accounts with the 2014 international manual](#). It produces a regular statement of state financial operations and, on the finance ministry's own account, still faces inconsistent data across the Treasury, the central bank and other agencies.

Public debate and participation in policymaking

Neither the regulator ARPT, the operators nor the internet service providers issued an explanation for the social-media restriction, and the silence then had to cover more than a restriction: [a total two-hour national outage on 7 August, across mobile and fibre alike, was traced to the state landing-station operator, whose officials and the regulator both declined to explain it](#). The precedent is on the record rather than inferred: under the post-coup transition a government spokesman owned a three-month digital cut and said that in Guinea the internet is not a right.

ICT Infrastructure

Connectivity

Facebook, YouTube and TikTok became inaccessible on 28 July 2026. The Association des Blogueurs de Guinée activated its monitoring protocol the same morning, ran connectivity tests through the day through independent monitors in Conakry and the interior, and [concluded that the results converge on a targeted block of those three platforms, arguing the precision of the restriction excludes an ordinary outage](#). It grounded its objection in article 19 of the constitution, article 9 of the African Charter and article 19 of the ICCPR.

The restriction [disrupted business operations and online services](#), and was [still running on 7 August, outside any electoral period or declared crisis](#), with WhatsApp also disrupted and VPN traffic passing.

DPI

Data Exchange

On 24 July, ONECI signed a memorandum with NG Tech Innovation for a national interoperability and identity-verification platform over the RNPP, under the Dama Djigui programme, before the elections director-general and Conakry's mayors. No value, duration or scope was disclosed and the text is not public.

A second exchange was constituted in August, in the one domain where the state has a reason to move data between four ministries at once. The national One Health platform's steering committee was activated on 14 August, with the health, higher education, environment and livestock ministries signing a protocol agreement for shared data, joint epidemiological surveillance and coordinated response to zoonotic and environmental risk. No platform build, data-sharing rule, custodian or protection standard for the shared health and animal data is stated — which is the shape a published commentary the same week argues runs through the whole estate: sectoral platforms in health, policing and civil registry still siloed a decade after the 2016 cybersecurity and data-protection law and more than a year after the April 2025 decree creating the unique identifier, with no independent, operational data-protection authority and no sovereignty over hosting or system audits.

Digital Identity and CRVS

Four days later, Multimédia Glory Guinée — the state's own technical partner deploying the biometric civil-registration system — stated publicly that fees not provided for in the regulations were being taken at enrolment centres, that a pay-for-priority tier operated, and that citizens were unaware the documents are free. It asked two ministries for unannounced inspections, sanctions, an information campaign and a reporting line; neither had responded at publication.

On 10 August the territorial administration minister put birth registration at 72% in 2025 against 54% in 2022, and said a unique personal identification number was being put in place alongside digitalisation of the civil-status system. The figures are the minister's own, given at a commemorative event with no statistical source named, and the identification number still has no instrument, issuing authority, format or enrolment figure on record.

Digital Payments and Fintech

NimbaPay opened for operations on 22 July 2026, making banks, electronic-money institutions and microfinance institutions interoperable nationwide. The governor of the central bank put financial-account access at 4% in 2011 and about 36% in 2024, and named state payments and cross-border payments as the next phases. It was built in 127 days on Mojaloop open source by Guinéenne de Monétique, with AfricaNenda and Thitsa Works, expressly so that the state retains control of the infrastructure. The following day the central bank stated that more than 70% of payments are still made in cash even at merchants already equipped with electronic solutions, and named interoperable merchant QR codes and fiscal incentives as workstreams under study. Its project register records the RTGS migration to ISO 20022 held by unpaid invoices to the supplier CMA and customs clearance, and PAPSS participation with no transaction recorded.

The strategy that would order all of this is not yet written. The central bank advertised a four-month consultancy on 14 August to draft a National Payment Systems and Instruments Strategy for 2027 to 2030, with applications closing on the 31st. No text, budget or adoption date exists.

Registries

The terms of reference for the RETSSM movable-collateral registry, opened 27 July under IDA Credit No. 74440GN, set the objective as guaranteeing the availability, security, reliability and adoption of an operational registry — with the first work package finalising the institutional, legal and regulatory provisions it needs to function at all.

The register that already works stopped working for the most basic reason there is. A civil-registration officer in Ratoma said on 7 August that the [secured paper the digital birth certificate is printed on had run out, leaving communes across Conakry and beyond unable to issue extracts for about a month](#); his own commune processes all applicants regardless of home commune and holds reserve stock for urgent cases such as exam-result travel and medical need. No ministry statement, restocking date or national count of affected communes is held, and the absence is now recorded as a gap. Officials marking African civil-registration day three days later [named information gaps and material shortages as the remaining barriers to civil-status access](#), the identification office's director general calling for tighter integration between health, civil-registration and statistical systems.

Sectoral management information systems

Health information systems here are being built by private operators rather than by the ministry. A Guinean academy's [Visa Medical hospital-digitisation model is deployed in 19 Guinean hospitals with more than a million users on a self-financed basis, and is being extended to Chad, the Democratic Republic of the Congo and Morocco](#). Separately, a Guinea-based physician's platform [coordinates blood donation and blood-bank logistics across West Africa](#), founded in 2022 to stop units expiring at one facility while another is short. Both are private; the figures are their own, and neither account states a ministry relationship, a patient-data protection arrangement or any interoperability with the national health information system, which remains In development.

Other GovTech and e-Gov

The treasury [began rolling out Œil du Trésor](#), a platform for prefectural treasurers to submit and track fund calls. No cost, vendor or completion date was disclosed.

Two more of the administration's own paper processes went onto systems in August. [GEME, an electronic system for managing state mission orders, was launched on 13 August](#) to control costs and improve accountability; no custodian, coverage, cost baseline or saving target is stated. The next day the President said he would [personally oversee GEDA, the decrees-and-orders management tool](#), to speed administrative processing, tying it to accelerating the Simandou 2040 programme. Personal oversight by the head of state is not an institutional control, and no throughput figure or publication rule is stated for either system.

A second citizen-facing platform launched, and one already running was presented abroad as evidence. The youth fund [launched a national platform for youth information, orientation, training, support and job placement, live on the web and on one mobile app store with the other to follow, with a national call for partners](#) — no user count, vacancy volume, placement figure or funding arrangement published. Days later the anti-corruption agency [took the procurement platform and the mining cadastre to the United Nations convention review group at Vienna as evidence of transparency reform](#), which is the first time the base records either system being used as an argument rather than described as a service.

Digitalisation

Rural digital data capture

The first rural digital service to reach farmers this month was a private one carried on a state bank's counters. An agritech firm and the state rural bank [launched a first cohort at Conakry on 6 August pairing field sensors, weather alerts and agronomic advice with the bank's network of over 1,000 service points](#). No cohort size, cost or coverage is stated, and the base still holds no state rural digital-services programme to set beside it.

Technology

Innovation ecosystem

The instrument the innovation layer waits on is still a draft: the [startup bill went through a relecture session at the commerce ministry on 29 April 2025](#), and no promulgated act has been found since. In August a [national innovation strategy went out to tender under Belgian development financing](#), procured ahead of the statute that would give it a legal base.

Data

Open data

The country-specific assessment behind the 2026 fiscal transparency report is now [held in full](#), where the base had previously carried nothing on this subject. It is a foreign government's judgement on its own criteria rather than a domestic disclosure, and it is the only recurring transparency measure the base holds for this country — which is a statement about the gap as much as about the finding.

Figures are dated because most are time-varying: a figure carries the date it was true, not the date you are reading it. Where the base holds no reliable statement, the document says **Not held** rather than leaving a silence — those are counted, and listed at the end.

This is a dated edition and is not revised after publication. If a figure here has moved, the current edition will say so.
